

# Zephyr Project Documentation

Release 2.7.0-rc2

The Zephyr Project Contributors  
Oct 09, 2022

# Table of contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
1.1	Licensing	1
1.2	Distinguishing Features	1
1.3	Community Support	3
1.4	Resources	3
1.5	Fundamental Terms and Concepts	4
<b>2</b>	<b>Getting Started Guide</b>	<b>5</b>
2.1	Select and Update OS	5
2.2	Install dependencies	5
2.3	Get Zephyr and install Python dependencies	7
2.4	Install a Toolchain	10
2.5	Build the Blinky Sample	11
2.6	Flash the Sample	11
2.7	Next Steps	12
2.8	Asking for Help	12
2.8.1	How to Ask	12
2.8.2	Use Copy/Paste	13
<b>3</b>	<b>Contribution Guidelines</b>	<b>15</b>
3.1	Licensing	15
3.1.1	Components using other Licenses	15
3.2	Copyrights Notices	16
3.3	Developer Certification of Origin (DCO)	16
3.3.1	DCO Sign-Off Methods	17
3.3.2	Notes	17
3.4	Prerequisites	17
3.5	Repository layout	17
3.6	Pull Requests and Issues	18
3.7	Tools and Git Setup	18
3.7.1	Signed-off-by	18
3.7.2	gitlint	18
3.7.3	twister	18
3.7.4	uncrustify	19
3.8	Coding Style	19
3.9	Other Guidelines	20
3.9.1	Coding Guidelines	20
3.9.2	Documentation Guidelines	39
3.10	Contribution Workflow	49
3.11	Commit Guidelines	51
3.11.1	Commit Message Body	52
3.11.2	Other Commit Expectations	52
3.11.3	Submitting Proposals	52
3.11.4	Identifying Contribution Origin	53
3.12	Continuous Integration (CI)	53
3.13	Contributions to External Modules	54
3.14	Contributing External Components	54

3.14.1	Contributing source code from external projects	54
<b>4</b>	<b>Development and Contribution Process</b>	<b>57</b>
4.1	TSC Project Roles	57
4.1.1	Main Roles	57
4.1.2	Role Retirement	58
4.1.3	Teams and Supporting Activities	58
4.1.4	MAINTAINERS File	60
4.1.5	Release Activity	61
4.2	Release Process	62
4.2.1	Merge Window	63
4.2.2	Release Quality Criteria	64
4.2.3	Releases	64
4.2.4	Release Procedure	67
4.3	Feature Tracking	70
4.3.1	Proposals and RFCs	71
4.3.2	Roadmap and Release Plans	72
4.4	Code Flow and Branches	72
4.4.1	Introduction	72
4.4.2	Roles and Responsibilities	73
4.5	Modifying Contributions made by other developers	73
4.5.1	Scenarios	73
4.5.2	Accepted policies	73
4.6	Development Environment and Tools	74
4.6.1	Code Review	74
4.6.2	Continuous Integration	77
4.6.3	Labeling issues and pull requests in GitHub	78
4.7	Bug Reporting	80
4.7.1	Reporting a regression issue	80
4.8	Communication and Collaboration	81
4.9	Code Documentation	81
4.9.1	API Documentation	81
4.9.2	Reference to Requirements	81
4.9.3	Test Documentation	81
4.9.4	Documentation Guidelines	81
4.10	Terminology	83
<b>5</b>	<b>Build and Configuration Systems</b>	<b>85</b>
5.1	Build System (CMake)	85
5.1.1	Build and Configuration Phases	85
5.1.2	Supporting Scripts and Tools	90
5.2	Configuration System (Kconfig)	93
5.2.1	Interactive Kconfig interfaces	93
5.2.2	Setting Kconfig configuration values	98
5.2.3	Kconfig - Tips and Best Practices	102
5.2.4	Custom Kconfig Preprocessor Functions	116
5.2.5	Kconfig extensions	117
<b>6</b>	<b>Application Development</b>	<b>119</b>
6.1	Overview	119
6.2	Source Tree Structure	120
6.3	Example standalone application	121
6.4	Creating an Application	121
6.5	Setting Variables	122
6.5.1	Option 1: Just Once	122
6.5.2	Option 2: In all Terminals	122
6.5.3	Option 3: Using zephyrrc files	123
6.5.4	Option 4: Using Zephyr Build Configuration CMake package	123
6.6	Important Build System Variables	124

6.7	Application CMakeLists.txt	124
6.8	CMakeCache.txt	126
6.9	Application Configuration	126
6.9.1	Kconfig Configuration	126
6.9.2	Devicetree Overlays	127
6.10	Application-Specific Code	127
6.10.1	Third-party Library Code	127
6.11	Building an Application	127
6.11.1	Basics	128
6.11.2	Build Directory Contents	129
6.11.3	Rebuilding an Application	129
6.11.4	Building for a board revision	130
6.12	Run an Application	130
6.12.1	Running on a Board	131
6.12.2	Running in an Emulator	131
6.13	Application Debugging	132
6.14	Custom Board, Devicetree and SOC Definitions	133
6.14.1	Boards	134
6.14.2	SOC Definitions	134
6.14.3	Devicetree Definitions	135
6.15	Debug with Eclipse	136
6.15.1	Overview	136
6.15.2	Set Up the Eclipse Development Environment	137
6.15.3	Generate and Import an Eclipse Project	137
6.15.4	Create a Debugger Configuration	137
6.15.5	RTOS Awareness	138
<b>7</b>	<b>API Reference</b>	<b>139</b>
7.1	API Status / Guidelines	139
7.1.1	API Overview	139
7.1.2	API Lifecycle	140
7.1.3	API Design Guidelines	144
7.1.4	API Terminology	145
7.2	Audio	148
7.2.1	Audio Codec	148
7.2.2	Audio DMIC	151
7.2.3	I2S	154
7.3	Asynchronous Notification APIs	163
7.3.1	API Reference	163
7.4	Bluetooth	166
7.4.1	Connection Management	166
7.4.2	Bluetooth Controller	189
7.4.3	Cryptography	190
7.4.4	Data Buffers	192
7.4.5	Generic Access Profile (GAP)	194
7.4.6	Generic Attribute Profile (GATT)	235
7.4.7	HCI Drivers	263
7.4.8	HCI RAW channel	267
7.4.9	Hands Free Profile (HFP)	269
7.4.10	Logical Link Control and Adaptation Protocol (L2CAP)	272
7.4.11	Bluetooth Mesh Profile	280
7.4.12	Serial Port Emulation (RFCOMM)	364
7.4.13	Service Discovery Protocol (SDP)	367
7.4.14	Universal Unique Identifiers (UUIDs)	380
7.5	Crypto	403
7.5.1	Overview	403
7.5.2	API Reference	403
7.6	Devicetree	409

7.6.1	Devicetree API	410
7.6.2	Bindings index	504
7.7	Device Driver Model	533
7.7.1	Introduction	533
7.7.2	Standard Drivers	534
7.7.3	Synchronous Calls	534
7.7.4	Driver APIs	534
7.7.5	Driver Data Structures	535
7.7.6	Subsystems and API Structures	535
7.7.7	Device-Specific API Extensions	536
7.7.8	Single Driver, Multiple Instances	537
7.7.9	Initialization Levels	539
7.7.10	System Drivers	539
7.7.11	Error handling	539
7.7.12	Memory Mapping	539
7.7.13	API Reference	542
7.8	Display Interface	550
7.8.1	API Reference	550
7.9	Error Detection And Correction (EDAC) API	562
7.9.1	API Reference	562
7.10	File Systems	566
7.10.1	Samples	567
7.10.2	API Reference	567
7.11	Iterable Sections	577
7.11.1	Usage	577
7.11.2	API Reference	578
7.12	Formatted Output	579
7.12.1	Cbprintf Packaging	580
7.12.2	API Reference	581
7.13	Kernel Services	588
7.13.1	Scheduling, Interrupts, and Synchronization	588
7.13.2	Data Passing	679
7.13.3	Memory Management	721
7.13.4	Timing	730
7.13.5	Other	745
7.14	C standard library	765
7.14.1	API Reference	765
7.15	Logging	771
7.15.1	Global Kconfig Options	773
7.15.2	Usage	774
7.15.3	Logging panic	776
7.15.4	Architecture	777
7.15.5	Limitations and recommendations	781
7.15.6	Benchmark	781
7.15.7	API Reference	782
7.16	Memory Management	803
7.16.1	Demand Paging	803
7.17	Miscellaneous APIs	809
7.17.1	Checksum APIs	809
7.17.2	Structured Data APIs	812
7.18	Data Structures	821
7.18.1	Single-linked List	821
7.18.2	Double-linked List	832
7.18.3	Multi Producer Single Consumer Packet Buffer	839
7.18.4	Balanced Red/Black Tree	841
7.18.5	Ring Buffers	844
7.19	MODBUS	856
7.19.1	Samples	856

7.19.2	API Reference	856
7.20	Networking	864
7.20.1	Network APIs	864
7.20.2	Network Buffer Management	925
7.20.3	Networking Technologies	970
7.20.4	Protocols	1000
7.20.5	Network System Management	1052
7.20.6	Time Sensitive Networking	1093
7.20.7	Controller Area Network	1100
7.20.8	Generic GSM Modem	1121
7.21	Peripherals	1122
7.21.1	ADC	1122
7.21.2	Counter	1128
7.21.3	Clock Control	1134
7.21.4	DAC	1136
7.21.5	DMA	1137
7.21.6	EC Host Command	1143
7.21.7	EEPROM	1147
7.21.8	Entropy	1148
7.21.9	Flash	1149
7.21.10	GNA	1154
7.21.11	GPIO	1157
7.21.12	Hardware Information	1172
7.21.13	I2C EEPROM Slave	1174
7.21.14	I2C	1175
7.21.15	IPM	1188
7.21.16	KSCAN	1191
7.21.17	LED	1192
7.21.18	Pinmux	1197
7.21.19	PWM	1199
7.21.20	PS/2	1206
7.21.21	PECI	1208
7.21.22	Regulators	1214
7.21.23	RTC	1216
7.21.24	Sensors	1222
7.21.25	SPI	1237
7.21.26	UART	1246
7.21.27	MDIO	1260
7.21.28	Watchdog	1262
7.21.29	Video	1264
7.21.30	eSPI	1272
7.22	Power Management	1288
7.22.1	Terminology	1288
7.22.2	Overview	1288
7.22.3	System Power Management	1289
7.22.4	Device Power Management Infrastructure	1293
7.22.5	Device Runtime Power Management	1297
7.22.6	Power Management Configuration Flags	1298
7.22.7	API Reference	1298
7.23	Random Number Generation	1304
7.23.1	Kconfig Options	1304
7.23.2	API Reference	1305
7.24	Resource Management	1305
7.24.1	On-Off Manager	1306
7.25	Shell	1314
7.25.1	Overview	1314
7.25.2	Commands	1315
7.25.3	Tab Feature	1321

7.25.4	History Feature	1321
7.25.5	Wildcards Feature	1321
7.25.6	Meta Keys Feature	1322
7.25.7	Getopt Feature	1322
7.25.8	Obscured Input Feature	1322
7.25.9	Shell Logger Backend Feature	1323
7.25.10	Usage	1323
7.25.11	API Reference	1324
7.26	Storage	1341
7.26.1	Non-Volatile Storage (NVS)	1341
7.26.2	Disk Access	1345
7.26.3	Flash map	1349
7.26.4	Flash Circular Buffer (FCB)	1354
7.26.5	Stream Flash	1359
7.27	Task Watchdog	1362
7.27.1	Overview	1362
7.27.2	Configuration Options	1362
7.27.3	API Reference	1362
7.28	Time Utilities	1364
7.28.1	Overview	1364
7.28.2	Time Utility APIs	1364
7.28.3	Concepts Underlying Time Support in Zephyr	1369
7.29	USB device stack	1371
7.29.1	USB Vendor and Product identifiers	1371
7.29.2	USB device controller drivers	1372
7.29.3	USB device core layer	1378
7.29.4	USB device class drivers	1384
7.29.5	Testing USB over USP/IP in native_posix	1387
7.29.6	USB Human Interface Devices (HID) support	1387
7.29.7	HID Class Device API	1400
7.30	User Mode	1401
7.30.1	Overview	1402
7.30.2	Memory Protection Design	1404
7.30.3	Kernel Objects	1413
7.30.4	System Calls	1418
7.30.5	MPU Stack Objects	1427
7.30.6	MPU Backed Userspace	1428
7.31	Utilities	1428
7.32	Settings	1440
7.32.1	Handlers	1440
7.32.2	Backends	1441
7.32.3	Zephyr Storage Backends	1441
7.32.4	Loading data from persisted storage	1441
7.32.5	Storing data to persistent storage	1441
7.32.6	Example: Device Configuration	1442
7.32.7	Example: Persist Runtime State	1443
7.32.8	Example: Custom Backend Implementation	1444
7.32.9	API Reference	1444
7.33	Executing Time Functions	1453
7.33.1	Configuration	1453
7.33.2	Usage	1453
7.33.3	API documentation	1454
7.34	Virtualization	1455
7.34.1	Inter-VM Shared Memory	1455
<b>8</b>	<b>User and Developer Guides</b>	<b>1459</b>
8.1	Beyond the Getting Started Guide	1459
8.1.1	Python and pip	1459

8.1.2	Advanced Setup and tool chain alternatives	1459
8.1.3	Set Up a Toolchain	1464
8.1.4	Cloning the Zephyr Repositories	1468
8.1.5	Export Zephyr CMake package	1469
8.1.6	Board Aliases	1469
8.1.7	Build and Run an Application	1469
8.2	Architecture-related Guides	1471
8.2.1	Zephyr support status on ARC processors	1471
8.2.2	Arm Cortex-M Developer Guide	1472
8.2.3	x86 Developer Guide	1482
8.3	Bluetooth	1483
8.3.1	Overview	1483
8.3.2	Bluetooth Stack Architecture	1485
8.3.3	Bluetooth Qualification	1491
8.3.4	Bluetooth tools	1512
8.3.5	Developing Bluetooth Applications	1514
8.3.6	AutoPTS on Windows 10 with nRF52 board	1518
8.3.7	AutoPTS on Linux	1530
8.4	Documentation Generation	1542
8.4.1	Documentation overview	1542
8.4.2	Installing the documentation processors	1543
8.4.3	Documentation presentation theme	1544
8.4.4	Running the documentation processors	1544
8.4.5	Filtering expected warnings	1545
8.4.6	Developer-mode Document Building	1545
8.5	Coccinelle	1546
8.5.1	Getting Coccinelle	1546
8.5.2	Supplemental documentation	1547
8.5.3	Using Coccinelle on Zephyr	1547
8.5.4	Examples	1547
8.5.5	Coccinelle parallelization	1547
8.5.6	Using Coccinelle with a single semantic patch	1548
8.5.7	Controlling which files are processed by Coccinelle	1548
8.5.8	Debugging Coccinelle SmPL patches	1548
8.5.9	Additional Flags	1548
8.5.10	SmPL patch specific options	1549
8.5.11	Proposing new semantic patches	1549
8.5.12	Detailed description of the report mode	1550
8.5.13	Detailed description of the patch mode	1551
8.5.14	Detailed description of the context mode	1552
8.5.15	Detailed description of the org mode	1553
8.5.16	Coccinelle Mailing List	1554
8.6	Code And Data Relocation	1554
8.6.1	Overview	1554
8.6.2	Details	1554
8.7	Cryptography	1555
8.7.1	TinyCrypt Cryptographic Library	1555
8.8	Flashing and Hardware Debugging	1560
8.8.1	Flash & Debug Host Tools	1560
8.8.2	Debug Probes	1564
8.9	Debugging and Tracing	1567
8.9.1	Thread analyzer	1567
8.9.2	Core Dump	1569
8.9.3	GDB stub	1575
8.9.4	Tracing	1576
8.10	Device Management	1608
8.10.1	MCUmgr	1608
8.10.2	Device Firmware Upgrade	1616

8.11	Devicetree Guide	1617
8.11.1	Introduction to devicetree	1617
8.11.2	Design goals	1626
8.11.3	Devicetree bindings	1627
8.11.4	Devicetree access from C/C++	1641
8.11.5	Devicetree HOWTOs	1652
8.11.6	Troubleshooting devicetree	1660
8.11.7	Devicetree versus Kconfig	1662
8.12	Peripheral and Hardware Emulators	1663
8.12.1	Overview	1663
8.12.2	Concept	1663
8.12.3	Available emulators	1665
8.12.4	Samples	1666
8.13	Modules (External projects)	1666
8.13.1	Module Repositories	1667
8.13.2	Contributing to Zephyr modules	1668
8.13.3	Licensing requirements and policies	1669
8.13.4	Documentation requirements	1670
8.13.5	Testing requirements	1670
8.13.6	Deprecating and removing modules	1671
8.13.7	Integrate modules in Zephyr build system	1671
8.13.8	Module yaml file description	1671
8.13.9	Submitting changes to modules	1677
8.14	Networking	1678
8.14.1	Overview	1678
8.14.2	Network Stack Architecture	1680
8.14.3	Network Connectivity API	1686
8.14.4	Networking with the host system	1686
8.14.5	Monitor Network Traffic	1699
8.15	Using with PlatformIO	1702
8.15.1	What is PlatformIO?	1702
8.15.2	Installation	1702
8.15.3	Configuration	1702
8.15.4	Tutorials	1703
8.15.5	Project Examples	1703
8.15.6	Next Steps	1703
8.16	OS Abstraction	1703
8.16.1	POSIX Support	1703
8.16.2	CMSIS RTOS v1	1714
8.16.3	CMSIS RTOS v2	1714
8.17	Porting	1715
8.17.1	Architecture Porting Guide	1715
8.17.2	Board Porting Guide	1741
8.17.3	Shields	1750
8.18	Testing	1753
8.18.1	Test Framework	1753
8.18.2	Test Runner (Twister)	1765
8.18.3	Generating coverage reports	1775
8.19	Trusted Firmware-M	1777
8.19.1	Trusted Firmware-M Overview	1777
8.19.2	TF-M Requirements	1781
8.19.3	TF-M Build System	1782
8.19.4	Trusted Firmware-M Integration	1784
8.20	West (Zephyr's meta-tool)	1785
8.20.1	Installing west	1785
8.20.2	West Release Notes	1786
8.20.3	Troubleshooting West	1794
8.20.4	Basics	1797

8.20.5	Built-in commands	1799
8.20.6	Workspaces	1803
8.20.7	West Manifests	1807
8.20.8	Configuration	1834
8.20.9	Extensions	1836
8.20.10	Building, Flashing and Debugging	1840
8.20.11	Signing Binaries	1852
8.20.12	Additional Zephyr extension commands	1853
8.20.13	History and Motivation	1855
8.20.14	Moving to West	1857
8.20.15	Using Zephyr without west	1857
8.21	Optimizations	1859
8.21.1	Optimizing for Footprint	1859
8.21.2	Optimization Tools	1860
8.22	Zephyr CMake Package	1865
8.22.1	Zephyr CMake package export (west)	1865
8.22.2	Zephyr CMake package export (without west)	1865
8.22.3	Zephyr application structure	1865
8.22.4	Zephyr Base Environment Setting	1867
8.22.5	Zephyr CMake Package Search Order	1867
8.22.6	Zephyr CMake Package Version	1868
8.22.7	Multiple Zephyr Installations (Zephyr workspace)	1869
8.22.8	Zephyr Build Configuration CMake package	1870
8.22.9	Zephyr Build Configuration CMake package (Freestanding application)	1871
8.22.10	Zephyr CMake package source code	1871
<b>9</b>	<b>Security</b>	<b>1873</b>
9.1	Zephyr Security Overview	1873
9.1.1	Introduction	1873
9.1.2	Current Security Definition	1874
9.1.3	Secure Development Process	1876
9.1.4	Secure Design	1880
9.1.5	Security Certification	1882
9.2	Security Vulnerability Reporting	1883
9.2.1	Introduction	1883
9.2.2	Security Issue Management	1883

# Chapter 1

## Introduction

The Zephyr OS is based on a small-footprint kernel designed for use on resource-constrained and embedded systems: from simple embedded environmental sensors and LED wearables to sophisticated embedded controllers, smart watches, and IoT wireless applications.

**The Zephyr kernel supports multiple architectures, including:**

- ARC EM and HS
- ARMv6-M, ARMv7-M, and ARMv8-M (Cortex-M)
- ARMv7-A and ARMv8-A (Cortex-A, 32- and 64-bit)
- ARMv7-R, ARMv8-R (Cortex-R, 32- and 64-bit)
- Intel x86 (32- and 64-bit)
- NIOS II Gen 2
- RISC-V (32- and 64-bit)
- SPARC V8
- Tensilica Xtensa

The full list of supported boards based on these architectures can be found [here](#).

### 1.1 Licensing

Zephyr is permissively licensed using the [Apache 2.0 license](#) (as found in the LICENSE file in the project's [GitHub repo](#)). There are some imported or reused components of the Zephyr project that use other licensing, as described in [Licensing of Zephyr Project components](#).

### 1.2 Distinguishing Features

Zephyr offers a large and ever growing number of features including:

**Extensive suite of Kernel services** Zephyr offers a number of familiar services for development:

- *Multi-threading Services* for cooperative, priority-based, non-preemptive, and preemptive threads with optional round robin time-slicing. Includes POSIX pthreads compatible API support.
- *Interrupt Services* for compile-time registration of interrupt handlers.
- *Memory Allocation Services* for dynamic allocation and freeing of fixed-size or variable-size memory blocks.

- *Inter-thread Synchronization Services* for binary semaphores, counting semaphores, and mutex semaphores.
- *Inter-thread Data Passing Services* for basic message queues, enhanced message queues, and byte streams.
- *Power Management Services* such as tickless idle and an advanced idling infrastructure.

**Multiple Scheduling Algorithms** Zephyr provides a comprehensive set of thread scheduling choices:

- Cooperative and Preemptive Scheduling
- Earliest Deadline First (EDF)
- Meta IRQ scheduling implementing “interrupt bottom half” or “tasklet” behavior
- Timeslicing: Enables time slicing between preemptible threads of equal priority
- Multiple queuing strategies:
  - Simple linked-list ready queue
  - Red/black tree ready queue
  - Traditional multi-queue ready queue

**Highly configurable / Modular for flexibility** Allows an application to incorporate *only* the capabilities it needs as it needs them, and to specify their quantity and size.

**Cross Architecture** Supports a wide variety of supported boards with different CPU architectures and developer tools. Contributions have added support for an increasing number of SoCs, platforms, and drivers.

**Memory Protection** Implements configurable architecture-specific stack-overflow protection, kernel object and device driver permission tracking, and thread isolation with thread-level memory protection on x86, ARC, and ARM architectures, userspace, and memory domains.

For platforms without MMU/MPU and memory constrained devices, supports combining application-specific code with a custom kernel to create a monolithic image that gets loaded and executed on a system’s hardware. Both the application code and kernel code execute in a single shared address space.

**Compile-time resource definition** Allows system resources to be defined at compile-time, which reduces code size and increases performance for resource-limited systems.

**Optimized Device Driver Model** Provides a consistent device model for configuring the drivers that are part of the platform/system and a consistent model for initializing all the drivers configured into the system and Allows the reuse of drivers across platforms that have common devices/IP blocks

**Devicetree Support** Use of [devicetree](#) to describe hardware. Information from devicetree is used to create the application image.

**Native Networking Stack supporting multiple protocols** Networking support is fully featured and optimized, including LwM2M and BSD sockets compatible support. OpenThread support (on Nordic chipsets) is also provided - a mesh network designed to securely and reliably connect hundreds of products around the home.

**Bluetooth Low Energy 5.0 support** Bluetooth 5.0 compliant (ESR10) and Bluetooth Low Energy Controller support (LE Link Layer). Includes Bluetooth mesh and a Bluetooth qualification-ready Bluetooth controller.

- Generic Access Profile (GAP) with all possible LE roles.
- GATT (Generic Attribute Profile)
- Pairing support, including the Secure Connections feature from Bluetooth 4.2
- Clean HCI driver abstraction
- Raw HCI interface to run Zephyr as a Controller instead of a full Host stack

- Verified with multiple popular controllers
- Highly configurable

Mesh Support:

- Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
- Both Provisioning bearers supported (PB-ADV & PB-GATT)
- Highly configurable, fitting in devices with at least 16k RAM

**Native Linux, macOS, and Windows Development** A command-line CMake build environment runs on popular developer OS systems. A native POSIX port, lets you build and run Zephyr as a native application on Linux and other OSes, aiding development and testing.

**Virtual File System Interface with LittleFS and FATFS Support** LittleFS and FATFS Support, FCB (Flash Circular Buffer) for memory constrained applications, and file system enhancements for logging and configuration.

**Powerful multi-backend logging Framework** Support for log filtering, object dumping, panic mode, multiple backends (memory, networking, filesystem, console, ..) and integration with the shell subsystem.

**User friendly and full-featured Shell interface** A multi-instance shell subsystem with user-friendly features such as autocompletion, wildcards, coloring, metakeys (arrows, backspace, ctrl+u, etc.) and history. Support for static commands and dynamic sub-commands.

**Settings on non-volatile storage** The settings subsystem gives modules a way to store persistent per-device configuration and runtime state. Settings items are stored as key-value pair strings.

**Non-volatile storage (NVS)** NVS allows storage of binary blobs, strings, integers, longs, and any combination of these.

**Native POSIX port** Supports running Zephyr as a Linux application with support for various subsystems and networking.

## 1.3 Community Support

Community support is provided via mailing lists and Discord; see the Resources below for details.

## 1.4 Resources

Here's a quick summary of resources to help you find your way around:

- **Help:** [Asking for Help Tips](#)
- **Documentation:** <http://docs.zephyrproject.org> (Getting Started Guide)
- **Source Code:** <https://github.com/zephyrproject-rtos/zephyr> is the main repository; <https://elixir.bootlin.com/zephyr/latest/source> contains a searchable index
- **Releases:** <https://github.com/zephyrproject-rtos/zephyr/releases>
- **Samples and example code:** see [Sample and Demo Code Examples](#)
- **Mailing Lists:** [users@lists.zephyrproject.org](mailto:users@lists.zephyrproject.org) and [devel@lists.zephyrproject.org](mailto:devel@lists.zephyrproject.org) are the main user and developer mailing lists, respectively. You can join the developer's list and search its archives at [Zephyr Development mailing list](#). The other [Zephyr mailing list subgroups](#) have their own archives and sign-up pages.
- **Nightly CI Build Status:** <https://lists.zephyrproject.org/g/builds> The [builds@lists.zephyrproject.org](mailto:builds@lists.zephyrproject.org) mailing list archives the CI (buildkite) nightly build results.

- **Chat:** Real-time chat happens in Zephyr’s Discord Server. Use this [Discord Invite](#) to register.
- **Contributing:** see the [Contribution Guide](#)
- **Wiki:** [Zephyr GitHub wiki](#)
- **Issues:** <https://github.com/zephyrproject-rtos/zephyr/issues>
- **Security Issues:** Email [vulnerabilities@zephyrproject.org](mailto:vulnerabilities@zephyrproject.org) to report security issues; also see our [Security](#) documentation. Security issues are tracked separately at <https://zephyrprojectsec.atlassian.net>.
- **Zephyr Project Website:** <https://zephyrproject.org>

## 1.5 Fundamental Terms and Concepts

See glossary

# Chapter 2

## Getting Started Guide

Follow this guide to:

- Set up a command-line Zephyr development environment on Ubuntu, macOS, or Windows (instructions for other Linux distributions are discussed in [Install Linux Host Dependencies](#))
- Get the source code
- Build, flash, and run a sample application

### 2.1 Select and Update OS

Click the operating system you are using.

Ubuntu

This guide covers Ubuntu version 18.04 LTS and later.

```
sudo apt update
sudo apt upgrade
```

macOS

On macOS Mojave or later, select *System Preferences > Software Update*. Click *Update Now* if necessary.

On other versions, see [this Apple support topic](#).

Windows

Select *Start > Settings > Update & Security > Windows Update*. Click *Check for updates* and install any that are available.

### 2.2 Install dependencies

Next, you'll install some host dependencies using your package manager.

The current minimum required version for the main dependencies are:

Tool	Min. Version
<a href="#">CMake</a>	3.20.0
<a href="#">Python</a>	3.6
<a href="#">Devicetree compiler</a>	1.4.6

Ubuntu

1. Download, inspect and execute the Kitware archive script to add the Kitware APT repository to your sources list. A detailed explanation of `kitware-archive.sh` can be found here [kitware third-party apt repository](#):

```
wget https://apt.kitware.com/kitware-archive.sh
sudo bash kitware-archive.sh
```

2. Use apt to install the required dependencies:

```
sudo apt install --no-install-recommends git cmake ninja-build gperf \
ccache dfu-util device-tree-compiler wget \
python3-dev python3-pip python3-setuptools python3-tk python3-wheel xz-utils \
↳file \
make gcc gcc-multilib g++-multilib libsdl2-dev
```

3. Verify the versions of the main dependencies installed on your system by entering:

```
cmake --version
python3 --version
dtc --version
```

Check those against the versions in the table in the beginning of this section. Refer to the [Install Linux Host Dependencies](#) page for additional information on updating the dependencies manually.

## macOS

1. Install [Homebrew](#):

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/
↳HEAD/install.sh)"
```

2. Use brew to install the required dependencies:

```
brew install cmake ninja gperf python3 ccache qemu dtc
```

## Windows

---

**Note:** Due to issues finding executables, the Zephyr Project doesn't currently support application flashing using the [Windows Subsystem for Linux \(WSL\)](#) (WSL).

Therefore, we don't recommend using WSL when getting started.

---

These instructions must be run in a `cmd.exe` command prompt. The required commands differ on PowerShell.

These instructions rely on [Chocolatey](#). If Chocolatey isn't an option, you can install dependencies from their respective websites and ensure the command line tools are on your PATH [environment variable](#).

1. [Install chocolatey](#).
2. Open a `cmd.exe` window as **Administrator**. To do so, press the Windows key, type "`cmd.exe`", right-click the result, and choose *Run as Administrator*.

3. Disable global confirmation to avoid having to confirm the installation of individual programs:

```
choco feature enable -n allowGlobalConfirmation
```

4. Use choco to install the required dependencies:

```
choco install cmake --installargs 'ADD_CMAKE_TO_PATH=System'
choco install ninja gperf python git dtc-msys2
```

5. Close the window and open a new `cmd.exe` window as a **regular user** to continue.

## 2.3 Get Zephyr and install Python dependencies

Next, clone Zephyr and its [modules](#) into a new [west](#) workspace named `zephyrproject`. You'll also install Zephyr's additional Python dependencies.

Python is used by the `west` meta-tool as well as by many scripts invoked by the build system. It is easy to run into package incompatibilities when installing dependencies at a system or user level. This situation can happen, for example, if working on multiple Zephyr versions at the same time. For this reason it is suggested to use [Python virtual environments](#).

Ubuntu

Install globally

1. Install `west`, and make sure `~/local/bin` is on your `PATH` [environment variable](#):

```
pip3 install --user -U west
echo 'export PATH=~/local/bin:$PATH' >> ~/.bashrc
source ~/.bashrc
```

2. Get the Zephyr source code:

```
west init ~/zephyrproject
cd ~/zephyrproject
west update
```

3. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

4. Zephyr's `scripts/requirements.txt` file declares additional Python dependencies. Install them with `pip3`.

```
pip3 install --user -r ~/zephyrproject/zephyr/scripts/requirements.txt
```

Install within virtual environment

1. Create a new virtual environment:

```
python3 -m venv ~/zephyrproject/.venv
```

2. Activate the virtual environment:

```
source ~/zephyrproject/.venv/bin/activate
```

Once activated your shell will be prefixed with `(.venv)`. The virtual environment can be deactivated at any time by running `deactivate`.

---

**Note:** Remember to activate the virtual environment every time you start working.

---

3. Install `west`:

```
pip install west
```

4. Get the Zephyr source code:

```
west init ~/zephyrproject
cd ~/zephyrproject
west update
```

5. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

6. Zephyr's `scripts/requirements.txt` file declares additional Python dependencies. Install them with pip.

```
pip install -r ~/zephyrproject/zephyr/scripts/requirements.txt
```

macOS

Install globally

1. Install west:

```
pip3 install -U west
```

2. Get the Zephyr source code:

```
west init ~/zephyrproject
cd ~/zephyrproject
west update
```

3. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

4. Zephyr's `scripts/requirements.txt` file declares additional Python dependencies. Install them with pip3.

```
pip3 install -r ~/zephyrproject/zephyr/scripts/requirements.txt
```

Install within virtual environment

1. Create a new virtual environment:

```
python3 -m venv ~/zephyrproject/.venv
```

2. Activate the virtual environment:

```
source ~/zephyrproject/.venv/bin/activate
```

Once activated your shell will be prefixed with `(.venv)`. The virtual environment can be deactivated at any time by running `deactivate`.

---

**Note:** Remember to activate the virtual environment every time you start working.

---

3. Install west:

```
pip install west
```

4. Get the Zephyr source code:

```
west init ~/zephyrproject
cd ~/zephyrproject
west update
```

5. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

6. Zephyr's scripts/requirements.txt file declares additional Python dependencies. Install them with pip.

```
pip install -r ~/zephyrproject/zephyr/scripts/requirements.txt
```

## Windows

### Install globally

1. Install west:

```
pip3 install -U west
```

2. Get the Zephyr source code:

```
cd %HOMEPATH%
west init zephyrproject
cd zephyrproject
west update
```

3. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

4. Zephyr's scripts\requirements.txt file declares additional Python dependencies. Install them with pip3.

```
pip3 install -r %HOMEPATH%\zephyrproject\zephyr\scripts\requirements.txt
```

### Install within virtual environment

1. Create a new virtual environment:

```
cd %HOMEPATH%
python3 -m venv zephyrproject\.venv
```

2. Activate the virtual environment:

```
:: cmd.exe
zephyrproject\.venv\Scripts\activate.bat
:: PowerShell
zephyrproject\.venv\Scripts\Activate.ps1
```

Once activated your shell will be prefixed with (.venv). The virtual environment can be deactivated at any time by running deactivate.

---

**Note:** Remember to activate the virtual environment every time you start working.

---

3. Install west:

```
pip install west
```

4. Get the Zephyr source code:

```
west init zephyrproject
cd zephyrproject
west update
```

5. Export a [Zephyr CMake package](#). This allows CMake to automatically load boilerplate code required for building Zephyr applications.

```
west zephyr-export
```

6. Zephyr's `scripts\requirements.txt` file declares additional Python dependencies. Install them with `pip`.

```
pip install -r %HOMEPATH%\zephyrproject\zephyr\scripts\requirements.txt
```

## 2.4 Install a Toolchain

A toolchain provides a compiler, assembler, linker, and other programs required to build Zephyr applications.

Ubuntu

The Zephyr Software Development Kit (SDK) contains toolchains for each of Zephyr's supported architectures. It also includes additional host tools, such as custom QEMU binaries and a host compiler.

1. Download the [latest SDK installer](#):

```
cd ~
wget https://github.com/zephyrproject-rtos/sdk-ng/releases/download/v0.13.1/
↪zephyr-sdk-0.13.1-linux-x86_64-setup.run
```

2. Run the installer, installing the SDK in `~/zephyr-sdk-0.13.1`:

```
chmod +x zephyr-sdk-0.13.1-linux-x86_64-setup.run
./zephyr-sdk-0.13.1-linux-x86_64-setup.run -- -d ~/zephyr-sdk-0.13.1
```

---

**Note:** It is recommended to install the Zephyr SDK at one of the following locations:

- `$HOME/zephyr-sdk[-x.y.z]`
- `$HOME/.local/zephyr-sdk[-x.y.z]`
- `$HOME/.local/opt/zephyr-sdk[-x.y.z]`
- `$HOME/bin/zephyr-sdk[-x.y.z]`
- `/opt/zephyr-sdk[-x.y.z]`
- `/usr/zephyr-sdk[-x.y.z]`
- `/usr/local/zephyr-sdk[-x.y.z]`

where `[-x.y.z]` is optional text, and can be any text, for example `-0.13.1`.

If installing the Zephyr SDK outside any of those locations, please read: [Install the Zephyr Software Development Kit \(SDK\)](#)

You cannot move the SDK directory after you have installed it.

---

3. Install [udev](#) rules, which allow you to flash most Zephyr boards as a regular user:

```
sudo cp ~/zephyr-sdk-0.13.1/sysroots/x86_64-pokysdk-linux/usr/share/openocd/  
→contrib/60-openocd.rules /etc/udev/rules.d  
sudo udevadm control --reload
```

macOS

Follow the instructions in [Set Up a Toolchain](#). Note that the Zephyr SDK is not available on macOS.

Do not forget to set the required [environment variables](#) (ZEPHYR\_TOOLCHAIN\_VARIANT and toolchain specific ones).

Windows

Follow the instructions in [Set Up a Toolchain](#). Note that the Zephyr SDK is not available on Windows.

Do not forget to set the required [environment variables](#) (ZEPHYR\_TOOLCHAIN\_VARIANT and toolchain specific ones).

## 2.5 Build the Blinky Sample

---

**Note:** Blinky is compatible with most, but not all, boards. If your board does not meet Blinky’s blinky-sample-requirements, then `hello_world` is a good alternative.

---

Build the blinky-sample with [west build](#), changing `<your-board-name>` appropriately for your board:

Ubuntu

```
cd ~/zephyrproject/zephyr  
west build -p auto -b <your-board-name> samples/basic/blinky
```

macOS

```
cd ~/zephyrproject/zephyr  
west build -p auto -b <your-board-name> samples/basic/blinky
```

Windows

```
cd %HOMEPATH%\zephyrproject\zephyr  
west build -p auto -b <your-board-name> samples\basic\blinky
```

The `-p auto` option automatically cleans byproducts from a previous build if necessary, which is useful if you try building another sample.

## 2.6 Flash the Sample

Connect your board, usually via USB, and turn it on if there’s a power switch. If in doubt about what to do, check your board’s page in [boards](#).

Then flash the sample using [west flash](#):

```
west flash
```

You may need to install additional [host tools](#) required by your board. The `west flash` command will print an error if any required dependencies are missing.

If you're using blinky, the LED will start to blink as shown in this figure:

Fig. 1: Phytel reel\_board running blinky

## 2.7 Next Steps

Here are some next steps for exploring Zephyr:

- Try other samples-and-demos
- Learn about [Application Development](#) and the `west` tool
- Find out about west's [flashing and debugging](#) features, or more about [Flashing and Hardware Debugging](#) in general
- Check out [Beyond the Getting Started Guide](#) for additional setup alternatives and ideas
- Discover [Resources](#) for getting help from the Zephyr community

## 2.8 Asking for Help

You can ask for help on a mailing list or on Discord. Please send bug reports and feature requests to GitHub.

- **Mailing Lists:** [users@lists.zephyrproject.org](mailto:users@lists.zephyrproject.org) is usually the right list to ask for help. [Search archives and sign up here](#).
- **Discord:** You can join with this [Discord invite](#).
- **GitHub:** Use [GitHub issues](#) for bugs and feature requests.

### 2.8.1 How to Ask

---

**Important:** Please search this documentation and the mailing list archives first. Your question may have an answer there.

---

Don't just say "this isn't working" or ask "is this working?". Include as much detail as you can about:

1. What you want to do
2. What you tried (commands you typed, etc.)
3. What happened (output of each command, etc.)

### 2.8.2 Use Copy/Paste

Please **copy/paste text** instead of taking a picture or a screenshot of it. Text includes source code, terminal commands, and their output.

Doing this makes it easier for people to help you, and also helps other users search the archives.

When copy/pasting more than 5 lines of text into Discord, create a snippet using three backticks to delimit the snippet.

## Chapter 3

# Contribution Guidelines

As an open-source project, we welcome and encourage the community to submit patches directly to the project. In our collaborative open source environment, standards and methods for submitting changes help reduce the chaos that can result from an active development community.

This document explains how to participate in project conversations, log bugs and enhancement requests, and submit patches to the project so your patch will be accepted quickly in the codebase.

### 3.1 Licensing

Licensing is very important to open source projects. It helps ensure the software continues to be available under the terms that the author desired.

Zephyr uses the [Apache 2.0 license](#) (as found in the LICENSE file in the project's [GitHub repo](#)) to strike a balance between open contribution and allowing you to use the software however you would like to. The Apache 2.0 license is a permissive open source license that allows you to freely use, modify, distribute and sell your own products that include Apache 2.0 licensed software. (For more information about this, check out articles such as [Why choose Apache 2.0 licensing](#) and [Top 10 Apache License Questions Answered](#)).

A license tells you what rights you have as a developer, as provided by the copyright holder. It is important that the contributor fully understands the licensing rights and agrees to them. Sometimes the copyright holder isn't the contributor, such as when the contributor is doing work on behalf of a company.

#### 3.1.1 Components using other Licenses

There are some imported or reused components of the Zephyr project that use other licensing, as described in [Licensing of Zephyr Project components](#).

Importing code into the Zephyr OS from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board.

By carefully reviewing potential contributions and also enforcing a [Developer Certification of Origin \(DCO\)](#) for contributed code, we can ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

See [Contributing source code from external projects](#) for more information about this contributing and review process for imported components.

## Licensing of Zephyr Project components

The Zephyr kernel tree imports or reuses packages, scripts and other files that are not covered by the [Apache 2.0 License](#). In some places there is no LICENSE file or way to put a LICENSE file there, so we describe the licensing in this document.

*scripts/{checkpatch.pl,checkstack.pl,get\_maintainers.pl,spelling.txt}* Origin: Linux Kernel

Licensing: [GPLv2 License](#)

## 3.2 Copyrights Notices

Please follow this [Community Best Practice](#) for Copyright Notices from the Linux Foundation.

## 3.3 Developer Certification of Origin (DCO)

To make a good faith effort to ensure licensing criteria are met, the Zephyr project requires the Developer Certificate of Origin (DCO) process to be followed.

The DCO is an attestation attached to every contribution made by every developer. In the commit message of the contribution, (described more fully later in this document), the developer simply adds a Signed-off-by statement and thereby agrees to the DCO.

When a developer submits a patch, it is a commitment that the contributor has the right to submit the patch per the license. The DCO agreement is shown below and at <http://developercertificate.org/>.

Developer's Certificate of Origin 1.1

By making a contribution to this project, I certify that:

- (a) The contribution was created in whole or in part by me and I have the right to submit it under the open source license indicated in the file; or
- (b) The contribution is based upon previous work that, to the best of my knowledge, is covered under an appropriate open source license and I have the right under that license to submit that work with modifications, whether created in whole or in part by me, under the same open source license (unless I am permitted to submit under a different license), as Indicated in the file; or
- (c) The contribution was provided directly to me by some other person who certified (a), (b) or (c) and I have not modified it.
- (d) I understand and agree that this project and the contribution are public and that a record of the contribution (including all personal information I submit with it, including my sign-off) is maintained indefinitely and may be redistributed consistent with this project or the open source license(s) involved.

### 3.3.1 DCO Sign-Off Methods

The DCO requires a sign-off message in the following format appear on each commit in the pull request:

```
Signed-off-by: Zephyrus Zephyr <zephyrus@zephyrproject.org>
```

The DCO text can either be manually added to your commit body, or you can add either `-s` or `--signoff` to your usual Git commit commands. If you forget to add the sign-off you can also amend a previous commit with the sign-off by running `git commit --amend -s`. If you've pushed your changes to GitHub already you'll need to force push your branch after this with `git push -f`.

### 3.3.2 Notes

Any contributions made as part of submitted pull requests are considered free for the Project to use. Developers are permitted to cherry-pick patches that are included in pull requests submitted by other contributors. It is expected that

- the content of the patches will not be substantially modified,
- the cherry-picked commits or portions of a commit shall preserve the original sign-off messages and the author identity.

*Modifying Contributions made by other developers* describes additional recommended policies around working with contributions submitted by other developers.

## 3.4 Prerequisites

As a contributor, you'll want to be familiar with the Zephyr project, how to configure, install, and use it as explained in the [Zephyr Project website](#) and how to set up your development environment as introduced in the Zephyr [Getting Started Guide](#).

You should be familiar with common developer tools such as Git and CMake, and platforms such as GitHub.

If you haven't already done so, you'll need to create a (free) GitHub account on <https://github.com> and have Git tools available on your development system.

---

**Note:** The Zephyr development workflow supports all 3 major operating systems (Linux, macOS, and Windows) but some of the tools used in the sections below are only available on Linux and macOS. On Windows, instead of running these tools yourself, you will need to rely on the Continuous Integration (CI) service buildkite, which runs automatically on GitHub when you submit your Pull Request (PR). You can see any failure results in the Buildkite details link near the end of the PR conversation list. See [Continuous Integration](#) for more information

---

## 3.5 Repository layout

To clone the main Zephyr Project repositories use the instructions in [Get Zephyr and install Python dependencies](#).

The Zephyr project directory structure is described in [Source Tree Structure](#) documentation. In addition to the Zephyr kernel itself, you'll also find the sources for technical documentation, sample code, supported board configurations, and a collection of subsystem tests. All of these are available for developers to contribute to and enhance.

## 3.6 Pull Requests and Issues

Before starting on a patch, first check in our issues [Zephyr Project Issues](#) system to see what's been reported on the issue you'd like to address. Have a conversation on the [Zephyr devel mailing list](#) (or the [Zephyr Discord Server](#)) to see what others think of your issue (and proposed solution). You may find others that have encountered the issue you're finding, or that have similar ideas for changes or additions. Send a message to the [Zephyr devel mailing list](#) to introduce and discuss your idea with the development community.

It's always a good practice to search for existing or related issues before submitting your own. When you submit an issue (bug or feature request), the triage team will review and comment on the submission, typically within a few business days.

You can find all [open pull requests](#) on GitHub and open [Zephyr Project Issues](#) in Github issues.

## 3.7 Tools and Git Setup

### 3.7.1 Signed-off-by

The name in the commit message Signed-off-by: line and your email must match the change authorship information. Make sure your `.gitconfig` is set up correctly:

```
git config --global user.name "David Developer"
git config --global user.email "david.developer@company.com"
```

### 3.7.2 gitlint

When you submit a pull request to the project, a series of checks are performed to verify your commit messages meet the requirements. The same step done during the CI process can be performed locally using the `gitlint` command.

Run `gitlint` locally in your tree and branch where your patches have been committed:

```
gitlint
```

Note, `gitlint` only checks HEAD (the most recent commit), so you should run it after each commit, or use the `--commits` option to specify a commit range covering all the development patches to be submitted.

### 3.7.3 twister

---

**Note:** `twister` does not currently run on Windows.

---

To verify that your changes did not break any tests or samples, please run the `twister` script locally before submitting your pull request to GitHub. To run the same tests the CI system runs, follow these steps from within your local Zephyr source working directory:

```
source zephyr-env.sh
./scripts/twister
```

The above will execute the basic `twister` script, which will run various kernel tests using the QEMU emulator. It will also do some build tests on various samples with advanced features that can't run in QEMU.

(continued from previous page)

```
echo "Run push hook"

while read local_ref local_sha remote_ref remote_sha
do
    args="$remote $url $local_ref $local_sha $remote_ref $remote_sha"
    exec ${ZEPHYR_BASE}/scripts/series-push-hook.sh $args
done

exit 0
```

If you want to override checkpatch verdict and push you branch despite reported issues, you can add option `-no-verify` to the git push command.

A more complete alternative to this is using `check_compliance.py` script from `ci-tools` repo.

## 3.9 Other Guidelines

Beyond the [Coding Style](#) that Zephyr enforces for all code that is submitted for inclusion, the project targets compliance with a series of coding guidelines. Refer to the [Coding Guidelines](#) section of the documentation for additional details.

### 3.9.1 Coding Guidelines

The project TSC and the Safety Committee of the project agreed to implement a staged and incremental approach for complying with a set of coding rules (AKA Coding Guidelines) to improve quality and consistency of the code base. Below are the agreed upon stages and the approximate timelines:

**Stage I** Coding guideline rules are available to be followed and referenced, but not enforced. Rules are not yet enforced in CI and pull-requests cannot be blocked by reviewers/approvers due to violations.

**Stage II** Begin enforcement on a limited scope of the code base. Initially this would be the safety certification scope. For rules easily applied across codebase, we should not limit compliance to initial scope. This step requires tooling and CI setup. This stage will begin during the 2.4 development cycle and end with the Zephyr LTS2 (2.6) to achieve and LTS2 that is ready for certification.

**Stage III** Revisit the coding guideline rules and based on experience from previous stages, refine/iterate on selected rules. This stage is to start after LTS2.

**Stage IV** Expand enforcement to the wider codebase. Exceptions may be granted on some areas of the codebase with a proper justification. Exception would require TSC approval.

---

**Note:** Coding guideline rules may be removed/changed at any time by filing a GH issue/RFC.

---

#### Main rules

The coding guideline rules are based on MISRA-C 2012 and are a subset of MISRA-C. The subset is listed in the table below with a summary of the rules, its severity and the equivalent rules from other standards for reference.

---

**Note:** For existing Zephyr maintainers and collaborators, if you are unable to obtain a copy through your employer, a limited number of copies will be made available through the project. If you need a copy of MISRA-C 2012, please send email to [safety@lists.zephyrproject.org](mailto:safety@lists.zephyrproject.org) and provide details on reason why

you can't obtain one through other options and expected contributions once you have one. The safety committee will review all requests.

Table 1: Main rules

MISRA C 2012	Severity	Description	CERT C	Example
Dir 1.1	Required	Any implementation-defined behaviour on which the output of the program depends shall be documented and understood	MSC09-C	Dir 1.1
Dir 2.1	Required	All source files shall compile without any compilation errors	N/A	Dir 2.1
Dir 3.1	Required	All code shall be traceable to documented requirements	N/A	Dir 3.1
Dir 4.1	Required	Run-time failures shall be minimized	N/A	Dir 4.1
Dir 4.2	Advisory	All usage of assembly language should be documented	N/A	Dir 4.2
Dir 4.4	Advisory	Sections of code should not be "commented out"	MSC04-C	Dir 4.4
Dir 4.5	Advisory	Identifiers in the same name space with overlapping visibility should be typographically unambiguous	DCL02-C	Dir 4.5
Dir 4.6	Advisory	typedefs that indicate size and signedness should be used in place of the basic numerical types	N/A	Dir 4.6
Dir 4.7	Required	If a function returns error information, then that error information shall be tested	N/A	Dir 4.7

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Dir 4.8	Advisory	If a pointer to a structure or union is never dereferenced within a translation unit, then the implementation of the object should be hidden	DCL12-C	Dir 4.8 example 1 Dir 4.8 example 2
Dir 4.9	Advisory	A function should be used in preference to a function-like macro where they are interchangeable	PRE00-C	Dir 4.9
Dir 4.10	Required	Precautions shall be taken in order to prevent the contents of a header file being included more than once	PRE06-C	Dir 4.10
Dir 4.11	Required	The validity of values passed to library functions shall be checked	N/A	Dir 4.11
Dir 4.12	Required	Dynamic memory allocation shall not be used	STR01-C	Dir 4.12
Dir 4.13	Advisory	Functions which are designed to provide operations on a resource should be called in an appropriate sequence	N/A	Dir 4.13
Dir 4.14	Required	The validity of values received from external sources shall be checked	N/A	Dir 4.14
Rule 1.2	Advisory	Language extensions should not be used	MSC04-C	Rule 1.2
Rule 1.3	Required	There shall be no occurrence of undefined or critical unspecified behaviour	N/A	Rule 1.3

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 2.1	Required	A project shall not contain unreachable code	MSC07-C	Rule 2.1 example 1 Rule 2.1 example 2
Rule 2.2	Required	There shall be no dead code	MSC12-C	Rule 2.2
Rule 2.3	Advisory	A project should not contain unused type declarations	N/A	Rule 2.3
Rule 2.6	Advisory	A function should not contain unused label declarations	N/A	Rule 2.6
Rule 2.7	Advisory	There should be no unused parameters in functions	N/A	Rule 2.7
Rule 3.1	Required	The character sequences /* and // shall not be used within a comment	MSC04-C	Rule 3.1
Rule 3.2	Required	Line-splicing shall not be used in // comments	N/A	Rule 3.2
Rule 4.1	Required	Octal and hexadecimal escape sequences shall be terminated	MSC09-C	Rule 4.1
Rule 4.2	Advisory	Trigraphs should not be used	PRE07-C	Rule 4.2
Rule 5.1	Required	External identifiers shall be distinct	DCL23-C	Rule 5.1 example 1 Rule 5.1 example 2
Rule 5.2	Required	Identifiers declared in the same scope and name space shall be distinct	DCL23-C	Rule 5.2
Rule 5.3	Required	An identifier declared in an inner scope shall not hide an identifier declared in an outer scope	DCL23-C	Rule 5.3
Rule 5.4	Required	Macro identifiers shall be distinct	DCL23-C	Rule 5.4
Rule 5.5	Required	Identifiers shall be distinct from macro names	DCL23-C	Rule 5.5

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 5.6	Required	A typedef name shall be a unique identifier	N/A	Rule 5.6
Rule 5.7	Required	A tag name shall be a unique identifier	N/A	Rule 5.7
Rule 5.8	Required	Identifiers that define objects or functions with external linkage shall be unique	N/A	Rule 5.8 example 1 Rule 5.8 example 2
Rule 5.9	Advisory	Identifiers that define objects or functions with internal linkage should be unique	N/A	Rule 5.9 example 1 Rule 5.9 example 2
Rule 6.1	Required	Bit-fields shall only be declared with an appropriate type	INT14-C	Rule 6.1
Rule 6.2	Required	Single-bit named bit fields shall not be of a signed type	INT14-C	Rule 6.2
Rule 7.1	Required	Octal constants shall not be used	DCL18-C	Rule 7.1
Rule 7.2	Required	A u or U suffix shall be applied to all integer constants that are represented in an unsigned type	N/A	Rule 7.2
Rule 7.3	Required	The lowercase character l shall not be used in a literal suffix	DCL16-C	Rule 7.3
Rule 7.4	Required	A string literal shall not be assigned to an object unless the objects type is pointer to const-qualified char	N/A	Rule 7.4
Rule 8.1	Required	Types shall be explicitly specified	N/A	Rule 8.1
Rule 8.2	Required	Function types shall be in prototype form with named parameters	DCL20-C	Rule 8.2

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 9.1	Mandatory	The value of an object with automatic storage duration shall not be read before it has been set	N/A	<a href="#">Rule 9.1</a>
Rule 9.2	Required	The initializer for an aggregate or union shall be enclosed in braces	N/A	<a href="#">Rule 9.2</a>
Rule 9.3	Required	Arrays shall not be partially initialized	N/A	<a href="#">Rule 9.3</a>
Rule 9.4	Required	An element of an object shall not be initialized more than once	N/A	<a href="#">Rule 9.4</a>
Rule 9.5	Required	Where designated initializers are used to initialize an array object the size of the array shall be specified explicitly	N/A	<a href="#">Rule 9.5</a>
Rule 10.1	Required	Operands shall not be of an inappropriate essential type	<a href="#">STR04-C</a>	<a href="#">Rule 10.1</a>
Rule 10.2	Required	Expressions of essentially character type shall not be used inappropriately in addition and subtraction operations	<a href="#">STR04-C</a>	<a href="#">Rule 10.2</a>
Rule 10.3	Required	The value of an expression shall not be assigned to an object with a narrower essential type or of a different essential type category	<a href="#">STR04-C</a>	<a href="#">Rule 10.3</a>
Rule 10.4	Required	Both operands of an operator in which the usual arithmetic conversions are performed shall have the same essential type category	<a href="#">STR04-C</a>	<a href="#">Rule 10.4</a>

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 10.5	Advisory	The value of an expression should not be cast to an inappropriate essential type	N/A	<a href="#">Rule 10.5</a>
Rule 10.6	Required	The value of a composite expression shall not be assigned to an object with wider essential type	INT02-C	<a href="#">Rule 10.6</a>
Rule 10.7	Required	If a composite expression is used as one operand of an operator in which the usual arithmetic conversions are performed then the other operand shall not have wider essential type	INT02-C	<a href="#">Rule 10.7</a>
Rule 10.8	Required	The value of a composite expression shall not be cast to a different essential type category or a wider essential type	INT02-C	<a href="#">Rule 10.8</a>
Rule 11.2	Required	Conversions shall not be performed between a pointer to an incomplete type and any other type	N/A	<a href="#">Rule 11.2</a>
Rule 11.6	Required	A cast shall not be performed between pointer to void and an arithmetic type	N/A	<a href="#">Rule 11.6</a>
Rule 11.7	Required	A cast shall not be performed between pointer to object and a non-integer arithmetic type	N/A	<a href="#">Rule 11.7</a>
Rule 11.8	Required	A cast shall not remove any const or volatile qualification from the type pointed to by a pointer	EXP05-C	<a href="#">Rule 11.8</a>

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 11.9	Required	The macro NULL shall be the only permitted form of integer null pointer constant	N/A	<a href="#">Rule 11.9</a>
Rule 12.1	Advisory	The precedence of operators within expressions should be made explicit	<a href="#">EXP00-C</a>	<a href="#">Rule 12.1</a>
Rule 12.2	Required	The right hand operand of a shift operator shall lie in the range zero to one less than the width in bits of the essential type of the left hand operand	N/A	<a href="#">Rule 12.2</a>
Rule 12.4	Advisory	Evaluation of constant expressions should not lead to unsigned integer wrap-around	N/A	<a href="#">Rule 12.4</a>
Rule 12.5	Mandatory	The sizeof operator shall not have an operand which is a function parameter declared as “array of type”	N/A	<a href="#">Rule 12.5</a>
Rule 13.1	Required	Initializer lists shall not contain persistent side effects	N/A	<a href="#">Rule 13.1 example 1</a> <a href="#">Rule 13.1 example 2</a>
Rule 13.2	Required	The value of an expression and its persistent side effects shall be the same under all permitted evaluation orders	N/A	<a href="#">Rule 13.2</a>
Rule 13.3	Advisory	A full expression containing an increment (++) or decrement (--) operator should have no other potential side effects other than that caused by the increment or decrement operator	N/A	<a href="#">Rule 13.3</a>

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 13.4	Advisory	The result of an assignment operator should not be used	N/A	<a href="#">Rule 13.4</a>
Rule 13.5	Required	The right hand operand of a logical && or    operator shall not contain persistent side effects	<a href="#">EXP10-C</a>	<a href="#">Rule 13.5 example 1</a> <a href="#">Rule 13.5 example 2</a>
Rule 13.6	Mandatory	The operand of the sizeof operator shall not contain any expression which has potential side effects	N/A	<a href="#">Rule 13.6</a>
Rule 14.1	Required	A loop counter shall not have essentially floating type	N/A	<a href="#">Rule 14.1</a>
Rule 14.2	Required	A for loop shall be well-formed	N/A	<a href="#">Rule 14.2</a>
Rule 14.3	Required	Controlling expressions shall not be invariant	N/A	<a href="#">Rule 14.3</a>
Rule 14.4	Required	The controlling expression of an if statement and the controlling expression of an iteration-statement shall have essentially Boolean type	N/A	<a href="#">Rule 14.4</a>
Rule 15.2	Required	The goto statement shall jump to a label declared later in the same function	N/A	<a href="#">Rule 15.2</a>
Rule 15.3	Required	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement	N/A	<a href="#">Rule 15.3</a>
Rule 15.6	Required	The body of an iteration-statement or a selection-statement shall be a compound-statement	<a href="#">EXP19-C</a>	<a href="#">Rule 15.6</a>

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 17.4	Mandatory	All exit paths from a function with non-void return type shall have an explicit return statement with an expression	N/A	<a href="#">Rule 17.4</a>
Rule 17.5	Advisory	The function argument corresponding to a parameter declared to have an array type shall have an appropriate number of elements	N/A	<a href="#">Rule 17.5</a>
Rule 17.6	Mandatory	The declaration of an array parameter shall not contain the static keyword between the [ ]	N/A	<a href="#">Rule 17.6</a>
Rule 17.7	Required	The value returned by a function having non-void return type shall be used	N/A	<a href="#">Rule 17.7</a>
Rule 18.1	Required	A pointer resulting from arithmetic on a pointer operand shall address an element of the same array as that pointer operand	<a href="#">EXP08-C</a>	<a href="#">Rule 18.1</a>
Rule 18.2	Required	Subtraction between pointers shall only be applied to pointers that address elements of the same array	<a href="#">EXP08-C</a>	<a href="#">Rule 18.2</a>
Rule 18.3	Required	The relational operators >, >=, < and <= shall not be applied to objects of pointer type except where they point into the same object	<a href="#">EXP08-C</a>	<a href="#">Rule 18.3</a>

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 18.5	Advisory	Declarations should contain no more than two levels of pointer nesting	N/A	<a href="#">Rule 18.5</a>
Rule 18.6	Required	The address of an object with automatic storage shall not be copied to another object that persists after the first object has ceased to exist	N/A	<a href="#">Rule 18.6 example 1</a> <a href="#">Rule 18.6 example 2</a>
Rule 18.8	Required	Variable-length array types shall not be used	N/A	<a href="#">Rule 18.8</a>
Rule 19.1	Mandatory	An object shall not be assigned or copied to an overlapping object	N/A	<a href="#">Rule 19.1</a>
Rule 20.2	Required	The ‘, or characters and the /* or // character sequences shall not occur in a header file name”	N/A	<a href="#">Rule 20.2</a>
Rule 20.3	Required	The #include directive shall be followed by either a <filename> or “filename” sequence	N/A	<a href="#">Rule 20.3</a>
Rule 20.4	Required	A macro shall not be defined with the same name as a keyword	N/A	<a href="#">Rule 20.4</a>
Rule 20.7	Required	Expressions resulting from the expansion of macro parameters shall be enclosed in parentheses	<a href="#">PRE01-C</a>	<a href="#">Rule 20.7</a>
Rule 20.8	Required	The controlling expression of a #if or #elif preprocessing directive shall evaluate to 0 or 1	N/A	<a href="#">Rule 20.8</a>

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 20.9	Required	All identifiers used in the controlling expression of <code>#if</code> or <code>#elif</code> preprocessing directives shall be <code>#defined</code> before evaluation	N/A	<a href="#">Rule 20.9</a>
Rule 20.11	Required	A macro parameter immediately following a <code>#</code> operator shall not immediately be followed by a <code>##</code> operator	N/A	<a href="#">Rule 20.11</a>
Rule 20.12	Required	A macro parameter used as an operand to the <code>#</code> or <code>##</code> operators, which is itself subject to further macro replacement, shall only be used as an operand to these operators	N/A	<a href="#">Rule 20.12</a>
Rule 20.13	Required	A line whose first token is <code>#</code> shall be a valid preprocessing directive	N/A	<a href="#">Rule 20.13</a>
Rule 20.14	Required	All <code>#else</code> , <code>#elif</code> and <code>#endif</code> preprocessor directives shall reside in the same file as the <code>#if</code> , <code>#ifdef</code> or <code>#ifndef</code> directive to which they are related	N/A	<a href="#">Rule 20.14</a>
Rule 21.1	Required	<code>#define</code> and <code>#undef</code> shall not be used on a reserved identifier or reserved macro name	N/A	<a href="#">Rule 21.1</a>
Rule 21.2	Required	A reserved identifier or macro name shall not be declared	N/A	<a href="#">Rule 21.2</a>
Rule 21.3	Required	The memory allocation and deallocation functions of <code>&lt;stdlib.h&gt;</code> shall not be used	<a href="#">MSC24-C</a>	<a href="#">Rule 21.3</a>

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 22.10	Required	The value of errno shall only be tested when the last function to be called was an errno-setting-function	N/A	<a href="#">Rule 22.10</a>

## Additional rules

### Rule A.1: Conditional Compilation

**Severity** Required

**Description** Do not conditionally compile function declarations in header files. Do not conditionally compile structure declarations in header files. You may conditionally exclude fields within structure definitions to avoid wasting memory when the feature they support is not enabled.

**Rationale** Excluding declarations from the header based on compile-time options may prevent their documentation from being generated. Their absence also prevents use of `if (IS_ENABLED(CONFIG_FOO)) {}` as an alternative to preprocessor conditionals when the code path should change based on the selected options.

### Rule A.2: Inclusive Language

**Severity** Required

**Description** Do not introduce new usage of offensive terms listed below. This rule applies but is not limited to source code, comments, documentation, and branch names. Replacement terms may vary by area or subsystem, but should aim to follow updated industry standards when possible.

Exceptions are allowed for maintaining existing implementations or adding new implementations of industry standard specifications governed externally to the Zephyr Project.

Existing usage is recommended to change as soon as updated industry standard specifications become available or new terms are publicly announced by the governing body, or immediately if no specifications apply.

Offensive Terms	Recommended Replacements
<code>{master,leader} / slave</code>	<ul style="list-style-type: none"><li>• <code>{primary,main} / {secondary,replica}</code></li><li>• <code>{initiator,requester} / {target,responder}</code></li><li>• <code>{controller,host} / {device,worker,proxy,target}</code></li><li>• <code>director / performer</code></li><li>• <code>central / peripheral</code></li></ul>
<code>blacklist / whitelist</code>	<ul style="list-style-type: none"><li>• <code>denylist / allowlist</code></li><li>• <code>blocklist / allowlist</code></li><li>• <code>rejectlist / acceptlist</code></li></ul>
<code>grandfather policy</code>	<ul style="list-style-type: none"><li>• <code>legacy</code></li></ul>
<code>sanity</code>	<ul style="list-style-type: none"><li>• <code>coherence</code></li><li>• <code>confidence</code></li></ul>

**Rationale** Offensive terms do not create an inclusive community environment and therefore violate the Zephyr Project [Code of Conduct](#). This coding rule was inspired by a similar rule in [Linux](#).

**Status** Related GitHub Issues and Pull Requests are tagged with the [Inclusive Language Label](#).

Area	Selected Replacements	Status
<a href="#">Bluetooth</a>	See <a href="#">Bluetooth Appropriate Language Mapping Tables</a>	
eSPI	<ul style="list-style-type: none"> <li>• master / slave =&gt; TBD</li> </ul>	
gPTP	<ul style="list-style-type: none"> <li>• master / slave =&gt; TBD</li> </ul>	
<a href="#">I2C</a>	<ul style="list-style-type: none"> <li>• master / slave =&gt; TBD</li> </ul>	NXP publishes the <a href="#">I2C Specification</a> and has selected controller / target as replacement terms, but the timing to publish an announcement or new specification is TBD. Zephyr will update I2C when replacement terminology is confirmed by a public announcement or updated specification. See <a href="#">Zephyr issue 27033</a> .
<a href="#">I2S</a>	<ul style="list-style-type: none"> <li>• master / slave =&gt; TBD</li> </ul>	
SMP/AMP	<ul style="list-style-type: none"> <li>• master / slave =&gt; TBD</li> </ul>	
<a href="#">SPI</a>	<ul style="list-style-type: none"> <li>• master / slave =&gt; controller / peripheral</li> <li>• MOSI / MISO / SS =&gt; SDO / SDI / CS</li> </ul>	The Open Source Hardware Association has selected these replacement terms. See <a href="#">OSHOWA Resolution to Redefine SPI Signal Names</a>
<a href="#">Test Runner (Twister)</a>	<ul style="list-style-type: none"> <li>• platform_whitelist =&gt; platform_allow</li> <li>• sanitycheck =&gt; twister</li> </ul>	

### 3.9.2 Documentation Guidelines

---

**Note:** For instructions on building the documentation, see [Documentation Generation](#).

---

Zephyr Project content is written using the [reStructuredText](#) markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted standalone website. Developers can view this content either in its raw form as .rst markup files, or (with Sphinx installed) they can build the documentation using the Makefile on Linux systems, or make.bat on Windows, to generate the HTML content. The HTML content can then be viewed using a web browser. This same .rst content is also fed into the [Zephyr documentation](#) website (with a different theme applied).

You can read details about [reStructuredText](#) and about [Sphinx extensions](#) from their respective websites.

This document provides a quick reference for commonly used reST and Sphinx-defined directives and roles used to create the documentation you're reading.

## Headings

While reST allows use of both an overline and a matching underline to indicate a heading, we only use an underline indicator for headings.

- Document title (h1) use “#” for the underline character
- First section heading level (h2) use “\*”
- Second section heading level (h3) use “=”
- Third section heading level (h4) use “-“

The heading underline must be at least as long as the title it’s under.

For example:

```
This is a title heading
#####

some content goes here

First section heading
*****
```

## Content Highlighting

Some common reST inline markup samples:

- one asterisk: `*text*` for emphasis (*italics*),
- two asterisks: `**text**` for strong emphasis (**boldface**), and
- two backquotes: ``text`` for inline code samples.

If asterisks or backquotes appear in running text and could be confused with inline markup delimiters, you can eliminate the confusion by adding a backslash (\) before it.

## Lists

For bullet lists, place an asterisk (\*) or hyphen (-) at the start of a paragraph and indent continuation lines with two spaces.

The first item in a list (or sublist) must have a blank line before it and should be indented at the same level as the preceding paragraph (and not indented itself).

For numbered lists start with a 1. or a. for example, and continue with autonumbering by using a # sign. Indent continuation lines with three spaces:

```
* This is a bulleted list.
* It has two items, the second
  item and has more than one line of reST text.  Additional lines
  are indented to the first character of the
  text of the bullet list.

1. This is a new numbered list. If the wasn't a blank line before it,
  it would be a continuation of the previous list (or paragraph).
#. It has two items too.

a. This is a numbered list using alphabetic list headings
#. It has three items (and uses autonumbering for the rest of the list)
```

(continues on next page)

(continued from previous page)

```
#. Here's the third item

#. This is an autonumbered list (default is to use numbers starting
   with 1).

   #. This is a second-level list under the first item (also
      autonumbered). Notice the indenting.
   #. And a second item in the nested list.
#. And a second item back in the containing list. No blank line
   needed, but it wouldn't hurt for readability.
```

Definition lists (with a term and its definition) are a convenient way to document a word or phrase with an explanation. For example this reST content:

The Makefile has targets that include:

```
html
    Build the HTML output for the project

clean
    Remove all generated output, restoring the folders to a
    clean state.
```

Would be rendered as:

The Makefile has targets that include:

**html** Build the HTML output for the project

**clean** Remove all generated output, restoring the folders to a clean state.

### Multi-column lists

If you have a long bullet list of items, where each item is short, you can indicate the list items should be rendered in multiple columns with a special `.. rst-class:: rst-columns` directive. The directive will apply to the next non-comment element (e.g., paragraph), or to content indented under the directive. For example, this unordered list:

```
.. rst-class:: rst-columns

* A list of
* short items
* that should be
* displayed
* horizontally
* so it doesn't
* use up so much
* space on
* the page
```

would be rendered as:

- A list of
- short items
- that should be
- displayed
- horizontally

- so it doesn't
- use up so much
- space on
- the page

A maximum of three columns will be displayed, and change based on the available width of the display window, reducing to one column on narrow (phone) screens if necessary. We've deprecated use of the `hlist` directive because it misbehaves on smaller screens.

## Tables

There are a few ways to create tables, each with their limitations or quirks. [Grid tables](#) offer the most capability for defining merged rows and columns, but are hard to maintain:

```
+-----+-----+-----+-----+
| Header row, column 1 | Header 2 | Header 3 | Header 4 |
| (header rows optional) | | | |
+=====+=====+=====+=====+
| body row 1, column 1 | column 2 | column 3 | column 4 |
+-----+-----+-----+-----+
| body row 2 | ... | ... | you can |
+-----+-----+-----+-----+
| body row 3 with a two column span | ... | span |
+-----+-----+-----+-----+
| body row 4 | ... | ... | too |
+-----+-----+-----+-----+
```

This example would render as:

Header row, column 1 (header rows optional)	Header 2	Header 3	Header 4
body row 1, column 1	column 2	column 3	column 4
body row 2	...	...	you can easily span rows too
body row 3 with a two column span		...	
body row 4		...	

[List tables](#) are much easier to maintain, but don't support row or column spans:

```
.. list-table:: Table title
   :widths: 15 20 40
   :header-rows: 1

   * - Heading 1
     - Heading 2
     - Heading 3
   * - body row 1, column 1
     - body row 1, column 2
     - body row 1, column 3
   * - body row 2, column 1
     - body row 2, column 2
     - body row 2, column 3
```

This example would render as:

Table 2: Table title

Heading 1	Heading 2	Heading 3
body row 1, column 1	body row 1, column 2	body row 1, column 3
body row 2, column 1	body row 2, column 2	body row 2, column 3

The `:widths:` parameter lets you define relative column widths. The default is equal column widths. If you have a three-column table and you want the first column to be half as wide as the other two equal-width columns, you can specify `:widths: 1 2 2`. If you'd like the browser to set the column widths automatically based on the column contents, you can use `:widths: auto`.

### File names and Commands

Sphinx extends reST by supporting additional inline markup elements (called “roles”) used to tag text with special meanings and allow style output formatting. (You can refer to the [Sphinx Inline Markup](#) documentation for the full list).

For example, there are roles for marking filenames (`:file:`name``) and command names such as `make` (`:command:`make``). You can also use the ```inline code``` markup (double backticks) to indicate a filename.

For references to files that are in the Zephyr GitHub tree, a special role can be used that creates a hyperlink to that file. For example a reference to the reST file used to create this document can be generated using `:zephyr_file:`doc/guides/documentation/index.rst`` that will show up as [doc/guides/documentation/index.rst](#), a link to the “blob” file in the github repo. There's also a `:zephyr_raw:`doc/guides/documentation/index.rst`` role that will link to the “raw” content, [doc/guides/documentation/index.rst](#). (You can click on these links to see the difference.)

### Internal Cross-Reference Linking

Traditional ReST links are only supported within the current file using the notation:

```
Refer to the `internal-linking`_ page
```

which renders as,

Refer to the [internal-linking](#) page

Note the use of a trailing underscore to indicate an outbound link. In this example, the label was added immediately before a heading, so the text that's displayed is the heading text itself. You can change the text that's displayed as the link writing this as:

```
Refer to the `show this text instead <internal-linking>`_ page
```

which renders as,

Refer to the [show this text instead](#) page

### External Cross-Reference Linking

With Sphinx's help, we can create link-references to any tagged text within the Zephyr Project documentation.

Target locations in a document are defined with a label directive:

```
.. _my label name:

Heading
=====
```

Note the leading underscore indicating an inbound link. The content immediately following this label must be a heading, and is the target for a `:ref:`my label name`` reference from anywhere within the Zephyr documentation. The heading text is shown when referencing this label. You can also change the text that’s displayed for this link, such as:

```
:ref:`some other text <my label name>`
```

To enable easy cross-page linking within the site, each file should have a reference label before its title so it can be referenced from another file. These reference labels must be unique across the whole site, so generic names such as “samples” should be avoided. For example the top of this document’s .rst file is:

```
.. _doc_guidelines:

Documentation Guidelines for the Zephyr Project
#####
```

Other .rst documents can link to this document using the `:ref:`doc_guidelines`` tag and it will show up as [Documentation Guidelines](#). This type of internal cross reference works across multiple files, and the link text is obtained from the document source so if the title changes, the link text will update as well.

You can also define links to any URL and then reference it in your document. For example, with this label definition in the document:

```
.. _Zephyr Wikipedia Page:
    https://en.wikipedia.org/wiki/Zephyr_(operating_system)
```

you can reference it with:

```
Read the `Zephyr Wikipedia Page`_ for more information about the
project.
```

### `any` links

Within the Zephyr project, we’ve defined the default role to be “any”, meaning if you just write a phrase in back-ticks, e.g., ``doc_guidelines``, Sphinx will search through all domains looking for something called `doc_guidelines` to link to. In this case it will find the label at the top of this document, and link to [Documentation Guidelines](#). This can be useful for linking to doxygen-generated links for function names and such, but will cause a warning such as:

```
WARNING: 'any' reference target not found: doc_giudelines
```

if you misspelled ``doc_guidelines`` as ``doc_giudelines``.

### Non-ASCII Characters

You can insert non-ASCII characters such as a Trademark symbol (™), by using the notation `|trade|`. Available replacement names are defined in an include file used during the Sphinx processing of the reST files. The names of these replacement characters are the same as used in HTML entities used to insert characters in HTML, e.g., `&trade;`; and are defined in the file `sphinx_build/substitutions.txt` as listed here:

```

.. |br|    raw:: html      .. force a line break in HTML output (blank lines
↳needed here)

    <br />

.. |p|     raw:: html      .. force a blank line in HTML output (blank lines needed
↳here)

    <p></p>

.. These are replacement strings for non-ASCII characters used within the project
   using the same name as the html entity names (e.g., &copy;) for that character

.. |copy|  unicode:: U+000A9 .. COPYRIGHT SIGN
:ltrim:
.. |trade|  unicode:: U+02122 .. TRADEMARK SIGN
:ltrim:
.. |reg|    unicode:: U+000AE .. REGISTERED TRADEMARK SIGN
:ltrim:
.. |deg|    unicode:: U+000B0 .. DEGREE SIGN
:ltrim:
.. |plusminus| unicode:: U+000B1 .. PLUS-MINUS SIGN
:rtrim:
.. |micro|  unicode:: U+000B5 .. MICRO SIGN
:rtrim:
.. |sup2|   unicode:: U+00B2 .. SUPERScript TWO
:ltrim:

```

We've kept the substitutions list small but others can be added as needed by submitting a change to the `substitutions.txt` file.

### Code and Command Examples

Use the `reST` `code-block` directive to create a highlighted block of fixed-width text, typically used for showing formatted code or console commands and output. Smart syntax highlighting is also supported (using the `Pygments` package). You can also directly specify the highlighting language. For example:

```

.. code-block:: c

    struct z_object {
        char *name;
        uint8_t perms[CONFIG_MAX_THREAD_BYTES];
        uint8_t type;
        uint8_t flags;
        uint32_t data;
    } __packed;

```

Note the blank line between the `code-block` directive and the first line of the code-block body, and the body content is indented three spaces (to the first non-white space of the directive name).

This would be rendered as:

```

struct z_object {
    char *name;
    uint8_t perms[CONFIG_MAX_THREAD_BYTES];
    uint8_t type;
    uint8_t flags;

```

(continues on next page)

(continued from previous page)

```
uint32_t data;
} __packed;
```

You can specify other languages for the code-block directive, including `c`, `python`, and `rst`, and also `console`, `bash`, or `shell`. If you want no syntax highlighting, use the language `none`, for example:

```
.. code-block:: none
```

```
This would be a block of text styled with a background
and box, but with no syntax highlighting.
```

Would display as:

```
This would be a block of text styled with a background
and box, but with no syntax highlighting.
```

There's a shorthand for writing code blocks too: end the introductory paragraph with a double colon (`::`) and indent the code block content by three spaces. On output, only one colon will be shown. The highlighting package makes a best guess at the type of content in the block and highlighting purposes.

## Images

Images are included in documentation by using an image directive:

```
.. image:: ../../../../images/doc-gen-flow.png
:align: center
:alt: alt text for the image
```

or if you'd like to add an image caption, use:

```
.. figure:: ../../../../images/doc-gen-flow.png
:alt: image description

Caption for the figure
```

The file name specified is relative to the document source file, and we recommend putting images into an `images` folder where the document source is found. The usual image formats handled by a web browser are supported: JPEG, PNG, GIF, and SVG. Keep the image size only as large as needed, generally at least 500 px wide but no more than 1000 px, and no more than 250 KB unless a particularly large image is needed for clarity.

## Tabs, spaces, and indenting

Indenting is significant in reST file content, and using spaces is preferred. Extra indenting can (unintentionally) change the way content is rendered too. For lists and directives, indent the content text to the first non-white space in the preceding line. For example:

```
* List item that spans multiple lines of text
  showing where to indent the continuation line.

1. And for numbered list items, the continuation
  line should align with the text of the line above.

.. code-block::
```

(continues on next page)

(continued from previous page)

The text within a directive block should align with the first character of the directive name.

Keep the line length for documentation less than 80 characters to make it easier for reviewing in GitHub. Long lines because of URL references are an allowed exception.

### zephyr-app-commands Directive

This is a Zephyr directive for generating consistent documentation of the shell commands needed to manage (build, flash, etc.) an application.

For example, to generate commands to build samples/hello\_world for qemu\_x86 use:

```
.. zephyr-app-commands::
   :zephyr-app: samples/hello_world
   :board: qemu_x86
   :goals: build
```

Directive options:

**:tool:** which tool to use. Valid options are currently ‘cmake’, ‘west’ and ‘all’. The default is ‘west’.

**:app:** path to the application to build.

**:zephyr-app:** path to the application to build, this is an app present in the upstream zephyr repository. Mutually exclusive with :app:.

**:cd-into:** if set, build instructions are given from within the :app: folder, instead of outside of it.

**:generator:** which build system to generate. Valid options are currently ‘ninja’ and ‘make’. The default is ‘ninja’. This option is not case sensitive.

**:host-os:** which host OS the instructions are for. Valid options are ‘unix’, ‘win’ and ‘all’. The default is ‘all’.

**:board:** if set, the application build will target the given board.

**:shield:** if set, the application build will target the given shield.

**:conf:** if set, the application build will use the given configuration file. If multiple conf files are provided, enclose the space-separated list of files with quotes, e.g., “a.conf b.conf”.

**:gen-args:** if set, additional arguments to the CMake invocation

**:build-args:** if set, additional arguments to the build invocation

**:build-dir:** if set, the application build directory will *APPEND* this (relative, Unix-separated) path to the standard build directory. This is mostly useful for distinguishing builds for one application within a single page.

**:goals:** a whitespace-separated list of what to do with the app (in ‘build’, ‘flash’, ‘debug’, ‘debugserver’, ‘run’). Commands to accomplish these tasks will be generated in the right order.

**:maybe-skip-config:** if set, this indicates the reader may have already created a build directory and changed there, and will tweak the text to note that doing so again is not necessary.

**:compact:** if set, the generated output is a single code block with no additional comment lines

For example, the .. zephyr-app-commands listed above would render like this in the generated HTML output:

```
# From the root of the zephyr repository
west build -b qemu_x86 samples/hello_world
```

### Alternative Tabbed Content

As introduced in the [Getting Started Guide](#), you can provide alternative content to the reader via a tabbed interface. When the reader clicks on a tab, the content for that tab is displayed, for example:

```
.. tabs::

    .. tab:: Apples

        Apples are green, or sometimes red.

    .. tab:: Pears

        Pears are green.

    .. tab:: Oranges

        Oranges are orange.
```

will display as:

Apples

Apples are green, or sometimes red.

Pears

Pears are green.

Oranges

Oranges are orange.

Tabs can also be grouped, so that changing the current tab in one area changes all tabs with the same name throughout the page. For example:

Linux

Linux Line 1

macOS

macOS Line 1

Windows

Windows Line 1

Linux

Linux Line 2

macOS

macOS Line 2

Windows

Windows Line 2

In this latter case, we're using `.. group-tab::` instead of simply `.. tab::`. Under the hood, we're using the [sphinx-tabs](#) extension that's included in the Zephyr setup. Within a tab, you can have most any content *other than a heading* (code-blocks, ordered and unordered lists, pictures, paragraphs, and such). You can read more about [sphinx-tabs](#) from the link above.

## Instruction Steps

Also introduced in the [Getting Started Guide](#) is a style that makes it easy to create tutorial guides with clearly identified steps. Add the `.. rst-class:: numbered-step` directive immediately before a second-level heading (by project convention, a heading underlined with asterisks `*****`, and it will be displayed as a numbered step, sequentially numbered within the document. For example:

```
.. rst-class:: numbered-step

Put your right hand in
*****
```

### Put your right hand in

See the `doc/getting_started/index.rst` source file and compare with the [Getting Started Guide](#) to see a full example. As implemented, only one set of numbered steps is intended per document.

For instructions on building the documentation, see [Documentation Generation](#).

## 3.10 Contribution Workflow

One general practice we encourage, is to make small, controlled changes. This practice simplifies review, makes merging and rebasing easier, and keeps the change history clear and clean.

When contributing to the Zephyr Project, it is also important you provide as much information as you can about your change, update appropriate documentation, and test your changes thoroughly before submitting.

The general GitHub workflow used by Zephyr developers uses a combination of command line Git commands and browser interaction with GitHub. As it is with Git, there are multiple ways of getting a task done. We'll describe a typical workflow here:

1. [Create a Fork of Zephyr](#) to your personal account on GitHub. (Click on the fork button in the top right corner of the Zephyr project repo page in GitHub.)
2. On your development computer, change into the `zephyr` folder that was created when you [obtained the code](#):

```
cd zephyrproject/zephyr
```

Rename the default remote pointing to the [upstream repository](#) from `origin` to `upstream`:

```
git remote rename origin upstream
```

Let Git know about the fork you just created, naming it `origin`:

```
git remote add origin https://github.com/<your github id>/zephyr
```

and verify the remote repos:

```
git remote -v
```

The output should look similar to:

```
origin  https://github.com/<your github id>/zephyr (fetch)
origin  https://github.com/<your github id>/zephyr (push)
upstream https://github.com/zephyrproject-rtos/zephyr (fetch)
upstream https://github.com/zephyrproject-rtos/zephyr (push)
```

3. Create a topic branch (off of main) for your work (if you're addressing an issue, we suggest including the issue number in the branch name):

```
git checkout main
git checkout -b fix_comment_typo
```

Some Zephyr subsystems do development work on a separate branch from main so you may need to indicate this in your checkout:

```
git checkout -b fix_out_of_date_patch origin/net
```

4. Make changes, test locally, change, test, test again, ... (Check out the prior chapter on [twister](#) as well).
5. When things look good, start the pull request process by adding your changed files:

```
git add [file(s) that changed, add -p if you want to be more specific]
```

You can see files that are not yet staged using:

```
git status
```

6. Verify changes to be committed look as you expected:

```
git diff --cached
```

7. Commit your changes to your local repo:

```
git commit -s
```

The `-s` option automatically adds your Signed-off-by: to your commit message. Your commit will be rejected without this line that indicates your agreement with the [DCO](#). See the [Commit Guidelines](#) section for specific guidelines for writing your commit messages.

8. Push your topic branch with your changes to your fork in your personal GitHub account:

```
git push origin fix_comment_typo
```

9. In your web browser, go to your forked repo and click on the Compare & pull request button for the branch you just worked on and you want to open a pull request with.
10. Review the pull request changes, and verify that you are opening a pull request for the appropriate branch. The title and message from your commit message should appear as well.
11. If you're working on a subsystem branch that's not main, you may need to change the intended branch for the pull request here, for example, by changing the base branch from main to net.
12. GitHub will assign one or more suggested reviewers (based on the CODEOWNERS file in the repo). If you are a project member, you can select additional reviewers now too.
13. Click on the submit button and your pull request is sent and awaits review. Email will be sent as review comments are made, or you can check on your pull request at <https://github.com/zephyrproject-rtos/zephyr/pulls>.
14. While you're waiting for your pull request to be accepted and merged, you can create another branch to work on another issue. (Be sure to make your new branch off of main and not the previous branch.):

```
git checkout main
git checkout -b fix_another_issue
```

and use the same process described above to work on this new topic branch.

15. If reviewers do request changes to your patch, you can interactively rebase commit(s) to fix review issues. In your development repo:

```
git fetch --all
git rebase --ignore-whitespace upstream/main
```

The `--ignore-whitespace` option stops `git apply` (called by `rebase`) from changing any whitespace. Continuing:

```
git rebase -i <offending-commit-id>~
```

In the interactive rebase editor, replace `pick` with `edit` to select a specific commit (if there's more than one in your pull request), or remove the line to delete a commit entirely. Then edit files to fix the issues in the review.

As before, inspect and test your changes. When ready, continue the patch submission:

```
git add [file(s)]
git rebase --continue
```

Update commit comment if needed, and continue:

```
git push --force origin fix_comment_typo
```

By force pushing your update, your original pull request will be updated with your changes so you won't need to resubmit the pull request.

---

**Note:** While amending commits and force pushing is a common review model outside GitHub, and the one recommended by Zephyr, it's not the main model supported by GitHub. Forced pushes can cause unexpected behavior, such as not being able to use "View Changes" buttons except for the last one - GitHub complains it can't find older commits. You're also not always able to compare the latest reviewed version with the latest submitted version. When rewriting history GitHub only guarantees access to the latest version.

---

16. If the CI run fails, you will need to make changes to your code in order to fix the issues and amend your commits by rebasing as described above. Additional information about the CI system can be found in [Continuous Integration](#).

## 3.11 Commit Guidelines

Changes are submitted as Git commits. Each commit message must contain:

- A short and descriptive subject line that is less than 72 characters, followed by a blank line. The subject line must include a prefix that identifies the subsystem being changed, followed by a colon, and a short title, for example: `doc: update wiki references to new site`. (If you're updating an existing file, you can use `git log <filename>` to see what developers used as the prefix for previous patches of this file.)
- A change description with your logic or reasoning for the changes, followed by a blank line.
- A Signed-off-by line, Signed-off-by: `<name> <email>` typically added automatically by using `git commit -s`
- If the change addresses an issue, include a line of the form:

```
Fixes #<issue number>.
```

All changes and topics sent to GitHub must be well-formed, as described above.

### 3.11.1 Commit Message Body

When editing the commit message, please briefly explain what your change does and why it's needed. A change summary of "Fixes stuff" will be rejected.

**Warning:** An empty change summary body is not permitted. Even for trivial changes, please include a summary body in the commit message.

The description body of the commit message must include:

- **what** the change does,
- **why** you chose that approach,
- **what** assumptions were made, and
- **how** you know it works – for example, which tests you ran.

For examples of accepted commit messages, you can refer to the Zephyr GitHub [changelog](#).

### 3.11.2 Other Commit Expectations

- Commits must build cleanly when applied on top of each other, thus avoiding breaking bisectability.
- Commits must pass all CI checks (see [Continuous Integration](#) for more information)
- Each commit must address a single identifiable issue and must be logically self-contained. Unrelated changes should be submitted as separate commits.
- You may submit pull request RFCs (requests for comments) to send work proposals, progress snapshots of your work, or to get early feedback on features or changes that will affect multiple areas in the code base.
- When major new functionality is added, tests for the new functionality **MUST** be added to the automated test suite. All new APIs **MUST** be documented and tested and tests **MUST** cover at least 80% of the added functionality using the code coverage tool and reporting provided by the project.

### 3.11.3 Submitting Proposals

You can request a new feature or submit a proposal by submitting an issue to our GitHub Repository. If you would like to implement a new feature, please submit an issue with a proposal (RFC) for your work first, to be sure that we can use it. Please consider what kind of change it is:

- For a Major Feature, first open an issue and outline your proposal so that it can be discussed. This will also allow us to better coordinate our efforts, prevent duplication of work, and help you to craft the change so that it is successfully accepted into the project. Providing the following information will increase the chances of your issue being dealt with quickly:
  - Overview of the Proposal
  - Motivation for or Use Case
  - Design Details
  - Alternatives
  - Test Strategy
- Small Features can be crafted and directly submitted as a Pull Request.

### 3.11.4 Identifying Contribution Origin

When adding a new file to the tree, it is important to detail the source of origin on the file, provide attributions, and detail the intended usage. In cases where the file is an original to Zephyr, the commit message should include the following (“Original” is the assumption if no Origin tag is present):

```
Origin: Original
```

In cases where the file is *imported from an external project*, the commit message shall contain details regarding the original project, the location of the project, the SHA-id of the origin commit for the file and the intended purpose.

For example, a copy of a locally maintained import:

```
Origin: Contiki OS
License: BSD 3-Clause
URL: http://www.contiki-os.org/
commit: 853207acfdc6549b10eb3e44504b1a75ae1ad63a
Purpose: Introduction of networking stack.
```

For example, a copy of an externally maintained import in a module repository:

```
Origin: Tiny Crypt
License: BSD 3-Clause
URL: https://github.com/01org/tinycrypt
commit: 08ded7f21529c39e5133688ffb93a9d0c94e5c6e
Purpose: Introduction of TinyCrypt
```

## 3.12 Continuous Integration (CI)

The Zephyr Project operates a Continuous Integration (CI) system that runs on every Pull Request (PR) in order to verify several aspects of the PR:

- Git commit formatting
- Coding Style
- Twister builds for multiple architectures and boards
- Documentation build to verify any doc changes

CI is run both on the buildkite cloud service and Github Actions and it uses the same tools described in the [Contribution Tools](#) section. The CI results must be green indicating “All checks have passed” before the Pull Request can be merged. CI is run when the PR is created, and again every time the PR is modified with a commit.

The current status of the CI run can always be found at the bottom of the GitHub PR page, below the review status. Depending on the success or failure of the run you will see:

- “All checks have passed”
- “All checks have failed”

In case of failure you can click on the “Details” link presented below the failure message in order to navigate to buildkite or Github Actions and inspect the results. Once you click on the link you will be taken to the buildkite summary results page where a table with all the different builds will be shown. To see what build or test failed click on the row that contains the failed (i.e. non-green) build and then click on the “Tests” tab to see the console output messages indicating the failure.

The [builds@lists.zephyrproject.org](mailto:builds@lists.zephyrproject.org) mailing list archives the CI (buildkite) nightly build results.

## 3.13 Contributions to External Modules

Follow the guidelines in the [Modules \(External projects\)](#) section for contributing [new modules](#) and submitting changes to [existing modules](#).

## 3.14 Contributing External Components

### 3.14.1 Contributing source code from external projects

In some cases it is desirable to leverage existing, external source code in order to avoid re-implementing basic functionality or features that are readily available in other open source projects.

This section describes the circumstances under which external source code can be imported into Zephyr, and the process that governs the inclusion.

There are three main factors that will be considered during the inclusion process in order to determine whether it will be accepted. These will be described in the following sections.

#### Software License

---

**Note:** External source code licensed under the Apache-2.0 license is not subject to this section.

---

Integrating code into the Zephyr Project from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the [Zephyr governing board](#), as described in the [Zephyr project charter](#). The board will automatically reject licenses that have not been approved by the [Open Source Initiative \(OSI\)](#). See the [Submission and review process](#) section for more details.

By carefully reviewing potential contributions and also enforcing a [Developer Certification of Origin \(DCO\)](#) for contributed code, we ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

#### Merit

Just like with any other regular contribution, one that contains external code needs to be evaluated for merit. However, in the particular case of code that comes from an existing project, there are additional questions that must be answered in order to accept the contribution. More specifically, the following will be considered by the Technical Steering Committee and evaluated carefully before the external source code is accepted into the project:

- Is this the most optimal way to introduce the functionality to the project? Both the cost of implementing this internally and the one incurred in maintaining an externally developed codebase need to be evaluated.
- Is the external project being actively maintained? This is particularly important for source code that deals with security or cryptography.
- Have alternatives to the particular implementation proposed been considered? Are there other open source project that implement the same functionality?

#### Mode of integration

There are two ways of integrating external source code into the Zephyr Project, and careful consideration must be taken to choose the appropriate one for each particular case.

**Integration in the main tree** The first way to integrate external source code into the project is to simply import the source code files into the main zephyr repository. This automatically implies that the imported source code becomes part of the “mainline” codebase, which in turn requires that:

- The code is formatted according to the Zephyr [Coding Style](#)
- The code adheres to the project’s [Coding Guidelines](#)
- The code is subject to the same checks and verification requirements as the rest of the code in the main tree, including static analysis
- All files contain an SPDX tag if not already present
- An entry is added to the [licensing page](#)

This mode of integration can be applicable to both small and large external codebases, but it is typically used more commonly with the former.

**Integration as a module** The second way of integrating external source code into the project is to import the whole or parts of the third-party open source project into a separate repository, and then include it under the form of a [module](#). With this approach the code is considered as being developed externally, and thus it is not automatically subject to the requirements of the previous section.

### Ongoing maintenance

Regardless of the mode of integration, external source code that is integrated in Zephyr requires regular ongoing maintenance. The submitter of the proposal to integrate external source code must therefore commit to maintain the integration of such code for the foreseeable future. This may require adding an entry in the `MAINTAINERS.yaml` as part of the process.

### Submission and review process

Before external source code can be included in the project, it must be reviewed and accepted by the Technical Steering Committee (TSC) and, in some cases, by the Zephyr governing board.

A request for external source code integration must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the source code and how it integrates into the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the [Contributing source code from external projects](#) section in detail, so that you are informed of the criteria used by the TSC and board in order to approve or reject a request
2. Use the [New External Source Code Issue](#) to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Optionally you can also create a Pull Request that demonstrates the integration of the external source code and link to it from the issue
4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments

If, after consideration by the TSC, the conclusion is that integrating external source code is the best solution, and the external source code is licensed under the Apache-2.0 license, the submission process is complete and the external source code can be integrated.

If, however, the external source code uses a license other than Apache-2.0, then these additional steps must be followed:

1. The TSC chair will forward the link to the GitHub issue created during the early submission process to the Zephyr governing board for further review

2. The Zephyr governing board has two weeks to review and ask questions:

- If there are no objections, the matter is closed. Approval can be accelerated by unanimous approval of the board before the two weeks are up
- If a governing board member raises an objection that cannot be resolved via email, the board will meet to discuss whether to override the TSC approval or identify other approaches that can resolve the objections

3. On approval of the Zephyr TSC and governing board the submission process is complete

The flowchart below shows an overview of the process:

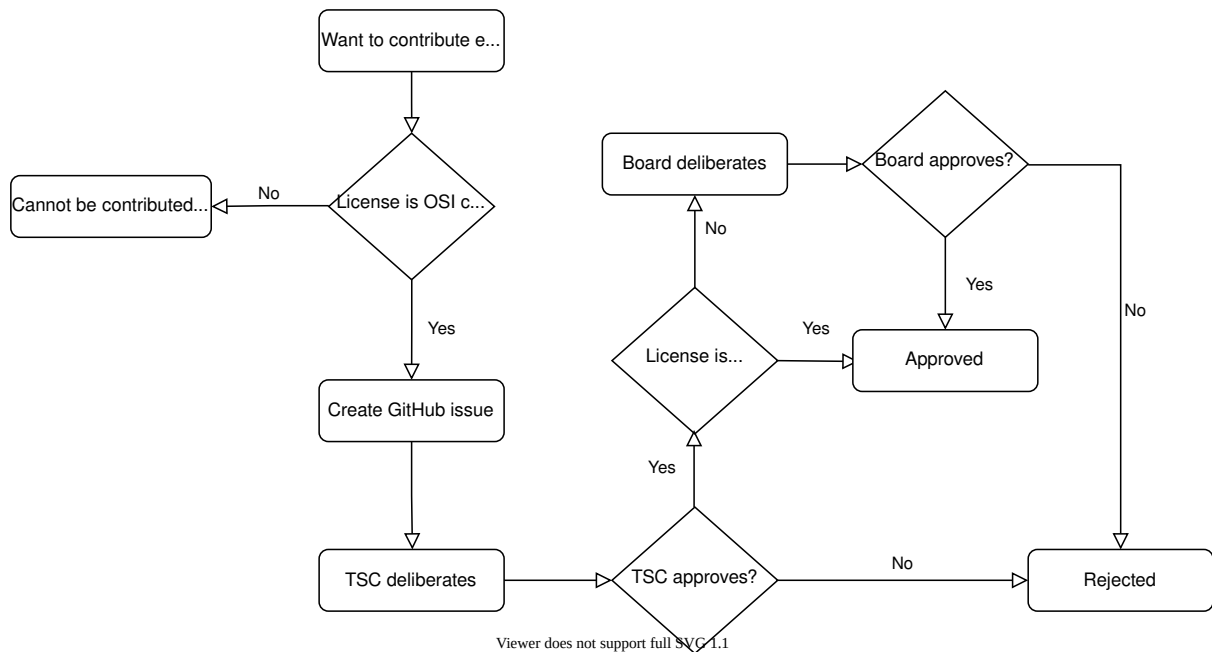

Fig. 1: Submission process

## Chapter 4

# Development and Contribution Process

### 4.1 TSC Project Roles

#### 4.1.1 Main Roles

TSC projects generally will involve *Maintainers*, *Collaborators*, and *Contributors*:

**Maintainer:** lead Collaborators on an area identified by the TSC (e.g. Architecture, code subsystems, etc.). Maintainers shall also serve as the area's representative on the TSC as needed. Maintainers may become voting members of the TSC under the guidelines stated in the project Charter.

**Collaborator:** A highly involved Contributor in one or more areas. May become a Maintainer with approval of existing TSC voting members.

**Contributor:** anyone in the community that contributes code or documentation to the project. Contributors may become Collaborators by approval of the existing Collaborators and Maintainers of the particular code base areas or subsystems.

#### Contributor

A *Contributor* is a developer who wishes to contribute to the project, at any level. Contributors who show dedication and skill are rewarded with additional rights and responsibilities.

Contributors are granted the following rights and responsibilities:

- Right to contribute code, documentation, translations, artwork, etc.
- Right to report defects (bugs) and suggestions for enhancement.
- Right to participate in the process of reviewing contributions by others.
- Right to initiate and participate in discussions in any communication methods.
- Right to approach any member of the community with matters they believe to be important.
- Right to participate in the feature development process.
- Responsibility to abide by decisions, once made. They are welcome to provide new, relevant information to reopen decisions.
- Responsibility for issues and bugs introduced by one's own contributions.
- Responsibility to respect the rules of the community.
- Responsibility to provide constructive advice whenever participating in discussions and in the review of contributions.

- Responsibility to follow the project's code of conduct ([https://github.com/zephyrproject-rtos/zephyr/blob/main/CODE\\_OF\\_CONDUCT.md](https://github.com/zephyrproject-rtos/zephyr/blob/main/CODE_OF_CONDUCT.md))

### Collaborator

A *Collaborator* is a Contributor who is also responsible for the maintenance of Zephyr source code. Their opinions weigh more when decisions are made, in a fully meritocratic fashion.

Collaborators have the following rights and responsibilities, in addition to those listed for Contributors:

- Right to set goals for the short and medium terms for the project being maintained, alongside the Maintainer.
- Responsibility to participate in the feature development process.
- Responsibility to review relevant code changes within reasonable time.
- Responsibility to ensure the quality of the code to expected levels.
- Responsibility to participate in community discussions.
- Responsibility to mentor new contributors when appropriate
- Responsibility to participate in the quality verification and release process, when those happen.

### Maintainer

A *Maintainer* is a Collaborator who is also responsible for knowing, directing and anticipating the needs of a given zephyr source code area.

Maintainers have the following rights and responsibilities, in addition to those listed for Contributors and Collaborators:

- Right to set the overall architecture of the relevant subsystems or areas of involvement.
- Right to make decisions in the relevant subsystems or areas of involvement, in conjunction with the collaborators.
- Responsibility to convey the direction of the relevant subsystem or areas to the TSC
- Responsibility to ensure all contributions of the project have been reviewed within reasonable time.
- Responsibility to enforce the code of conduct.

#### 4.1.2 Role Retirement

- Individuals elected to the following Project roles, including, Maintainer, Release Engineering Team member, Release Manager, but are no longer engaged in the project as described by the rights and responsibilities of that role, may be requested by the TSC to retire from the role they are elected.
- Such a request needs to be raised as a motion in the TSC and be approved by the TSC voting members. By approval of the TSC the individual is considered to be retired from the role they have been elected.
- The above applies to elected TSC Project roles that may be defined in addition.

#### 4.1.3 Teams and Supporting Activities

## Assignee

An *Assignee* is one of the maintainers of a subsystem or code being changed. Assignees are set either automatically based on the code being changed or set by the other Maintainers, the Release Engineering team can set an assignee when the latter is not possible.

- Right to dismiss stale reviews and seek reviews from additional maintainers, developers and contributors
- Right to block pull requests from being merged
- Responsibility to re-assign a pull request if they are the original submitter of the code
- Responsibility to drive the pull request to a mergeable state
- Solicit approvals from maintainers of the subsystems affected
- Responsibility to drive the escalation process

## Release Engineering Team

A team of active Maintainers involved in multiple areas.

- The members of the Release Engineering team are expected to fill the Release Manager role based on a defined cadence and selection process.
- The cadence and selection process are defined by the Release Engineering team and are approved by the TSC.
- The team reports directly into the TSC.

Release Engineering team has the following rights and responsibilities:

- Right to merge code changes to the zephyr tree following the project rules.
- Right to revert any changes that have broken the code base
- Right to close any stale changes after <N> months of no activity
- Responsibility to take directions from the TSC and follow them.
- Responsibility to coordinate code merges with maintainers.
- Responsibility to merge all contributions regardless of their origin and area if they have been approved by the respective maintainers and follow the merge criteria of a change.
- Responsibility to keep the Zephyr code base in a working and passing state (as per CI)

Joining the Release Engineering team

- Maintainers highly involved in the project may be nominated by a TSC voting member to join the Release Engineering team. Nominees may become members of the team by approval of the existing TSC voting members.
- To ensure a functional Release Engineering team the TSC shall periodically review the team's followed processes, the appropriate size, and the membership composition (ensure, for example, that team members are geographically distributed across multiple locations and time-zones).

## Release Manager

A *Maintainer* responsible for driving a specific release to completion following the milestones and the roadmap of the project for this specific release.

- TSC has to approve a release manager.

A Release Manager is a member of the Release Engineering team and has the rights and responsibilities of that team in addition to the following:

- Right to manage and coordinate all code merges after the code freeze milestone (M3, see [program management overview](#).)
- Responsibility to drive and coordinate the triaging process for the release
- Responsibility to create the release notes of the release
- Responsibility to notify all stakeholders of the project, including the community at large about the status of the release in a timely manner.
- Responsibility to coordinate with QA and validation and verify changes either directly or through QA before major changes and major milestones.

## Roles / Permissions

Table 1: Project Roles vs Github Permissions

		Admin	Merge Rights	Member	Owner	Collaborator
Main Roles	Contributor					x
	Collaborator			x		
	Maintainer			x		
Supportive Roles	QA/Validation			x		x
	DevOps	x				
	System Admin	x			x	
	Release Engineering	x	x	x		

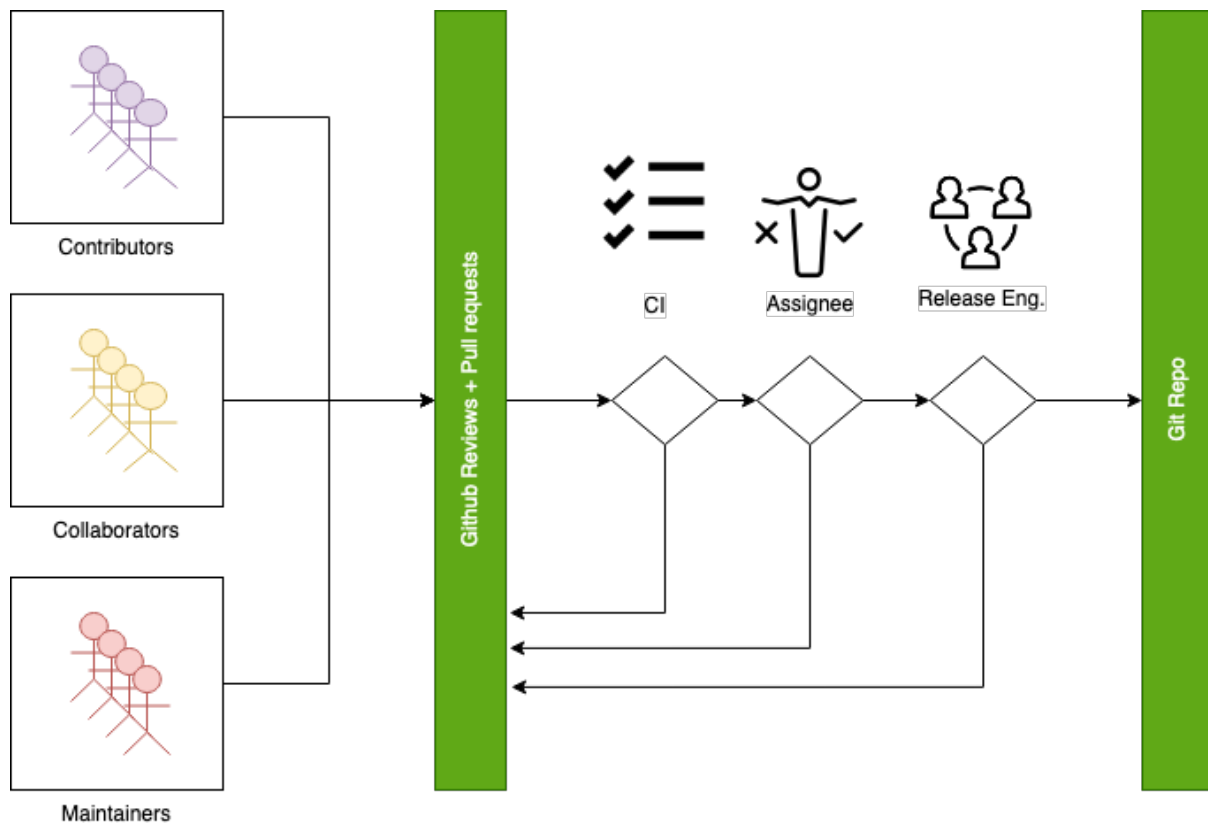

### 4.1.4 MAINTAINERS File

Generic guidelines for deciding and filling in the Maintainers' list

- The MAINTAINERS file shall replace the CODEOWNERS file and will be used for both setting assignees and reviewers.
- We should keep the granularity of code maintainership at a manageable level
- We should be looking for maintainers for areas of code that are orphaned (i.e. without an explicit maintainer)
  - Un-maintained areas should be indicated clearly in the MAINTAINERS file
- All submitted pull-requests should have an assignee
- We Introduce an area/subsystem hierarchy to address the above point
  - Parent-area maintainer should be acting as default substitute/fallback assignee for un-maintained sub-areas
  - Area maintainer gets precedence over parent-area maintainer
- Pull-requests may be re-assigned if this is needed or more appropriate
  - Re-assigned by original assignee (see “Assignee” slide)
- In general, updates to the MAINTAINERS file should be in a standalone commit alongside other changes introducing new files and directories to the tree.
- Major changes to the file, including the addition of new areas with new maintainers should come in as standalone pull-requests and require TSC review.
- If additional review by the TSC is required, the maintainers of the file should send the requested changes to the TSC and give members of the TSC two (2) days to object to any of the changes to maintainership of areas or the addition of new maintainers or areas.
- Path, collaborator and name changes do not require a review by the TSC.

- Addition of new areas without a maintainer do not require review by the TSC.
- The MAINTAINERS file itself shall have a maintainer
- Architectures, core components, sub-systems, samples, tests
  - Each area shall have an explicit maintainer
- Boards (incl relevant samples, tests), SoCs (incl DTS) \* May have a maintainer, shall have a higher-level platform maintainer
- Drivers
  - Shall have a driver-area (and API) maintainer
  - Could have individual driver implementation maintainers but preferably collaborator/contributors
  - In the above case, platform-specific PRs may be re-assigned to respective collaborator/contributor of driver implementation

#### 4.1.5 Release Activity

#### Merge Criteria

- All continuous integration checks have passed
  - Codeowners
  - Device Tree
  - Documentation

- Gitlint
- Identity/Emails
- Kconfig
- License
- Checkpatch (Coding Style)
- Pylint
- Integration Tests (Via twister) on emulation/simulation platforms
- Simulated Bluetooth Tests
- Planned
  - Footprint
  - Code coverage
  - Coding Guidelines
  - Static Analysis (Coverity)
  - Documentation coverage (APIs)
- PR template with checklist
- Minimal of 2 approvals
  - A collaborator from the same subsystem.
  - Alternately another maintainer of another subsystem
  - Approval by the assignee
- A minimum review period of 2 days, 4 hours for trivial changes (see [Give reviewers time to review before code merge](#)). Hotfixes can be merged at any time after CI passes.
- All required checks are passing

## Escalation Process

- Contributors may object to change requests or decisions made by Maintainers.
- Process
  - Resolve in the PR among assignee, maintainers and reviewer
    - \* Assignee to act as moderator if applicable
  - Optionally resolve in the dev review meeting with more Maintainers and project stakeholders
    - \* The involved parties and the Assignee to be present when the (escalated) issue is discussed
  - TSC: Assignees can escalate to the TSC voting members and get a binding resolution in the TSC.
  - Assignee to ensure the resolution of the escalation is reflected in the PR review.

## 4.2 Release Process

The Zephyr project releases on a time-based cycle, rather than a feature-driven one. Zephyr releases represent an aggregation of the work of many contributors, companies, and individuals from the community.

A time-based release process enables the Zephyr project to provide users with a balance of the latest technologies and features and excellent overall quality. A roughly 4-month release cycle allows the project to coordinate development of the features that have actually been implemented, allowing the project to maintain the quality of the overall release without delays because of one or two features that are not ready yet.

The Zephyr release model is loosely based on the Linux kernel model:

- Release tagging procedure:
  - linear mode on main branch,
  - release branches for maintenance after release tagging.
- Each release period will consist of a merge window period followed by one or more release candidates on which only stabilization changes, bug fixes, and documentation can be merged in.
  - Merge window mode: all changes are accepted (subject to approval from the respective maintainers.)
  - When the merge window is closed, the release owner lays a vN-rc1 tag and the tree enters the release candidate phase
  - CI sees the tag, builds and runs tests; QA analyses the report from the build and test run and gives an ACK/NAK to the build
  - The release owner, with QA and any other needed input, determines if the release candidate is a go for release
  - If it is a go for a release, the release owner lays a tag release vN at the same point
- Development on new features continues in topic branches. Once features are ready, they are submitted to mainline during the merge window period and after the release is tagged.

Fig. 1: Release Cycle

### 4.2.1 Merge Window

A relatively straightforward discipline is followed with regard to the merging of patches for each release. At the beginning of each development cycle, the “merge window” is said to be open. At that time, code which is deemed to be sufficiently stable (and which is accepted by the development community) is merged into the mainline tree. The bulk of changes for a new development cycle (and all of the major changes) will be merged during this time.

The merge window lasts for approximately two months. At the end of this time, the release owner will declare that the window is closed and release the first of the release candidates. For the codebase release which is destined to be 0.4.0, for example, the release which happens at the end of the merge window will be called 0.4.0-rc1. The -rc1 release is the signal that the time to merge new features has passed, and that the time to stabilize the next release of the code base has begun.

Over the next weeks, only patches which fix problems should be submitted to the mainline. On occasion, a more significant change will be allowed, but such occasions are rare and require a TSC approval (Change Control Board). As a general rule, if you miss the merge window for a given feature, the best thing to do is to wait for the next development cycle. (An occasional exception is made for drivers

for previously unsupported hardware; if they do not touch any other in-tree code, they cannot cause regressions and should be safe to add at any time).

As fixes make their way into the mainline, the patch rate will slow over time. The mainline release owner releases new -rc drops once or twice a week; a normal series will get up to somewhere between -rc4 and -rc6 before the code base is considered to be sufficiently stable and the quality metrics have been achieved at which point the final 0.4.x release is made.

At that point, the whole process starts over again.

Here is the description of the various moderation levels:

- Low:
  - Major New Features
  - Bug Fixes
  - Refactoring
  - Structure/Directory Changes
- Medium:
  - Bug Fixes, all priorities
  - Enhancements
  - Minor “self-contained” New Features
- High:
  - Bug Fixes: P1 and P2
  - Documentation + Test Coverage

### 4.2.2 Release Quality Criteria

The current backlog of prioritized bugs shall be used as a quality metric to gate the final release. The following counts shall be used:

Table 2: Bug Count Release Thresholds

High	Medium	Low
0	<20	<50

---

**Note:** The “low” bug count target of <50 will be a phased approach starting with 150 for release 2.4.0, 100 for release 2.5.0, and 50 for release 2.6.0

---

### 4.2.3 Releases

The following syntax should be used for releases and tags in Git:

- Release [Major].[Minor].[Patch Level]
- Release Candidate [Major].[Minor].[Patch Level]-rc[RC Number]
- Tagging:
  - v[Major].[Minor].[Patch Level]-rc[RC Number]
  - v[Major].[Minor].[Patch Level]

- v[Major].[Minor].99 - A tag applied to main branch to signify that work on v[Major].[Minor+1] has started. For example, v1.7.99 will be tagged at the start of v1.8 process. The tag corresponds to VERSION\_MAJOR/VERSION\_MINOR/PATCHLEVEL macros as defined for a work-in-progress main branch version. Presence of this tag allows generation of sensible output for “git describe” on main branch, as typically used for automated builds and CI tools.

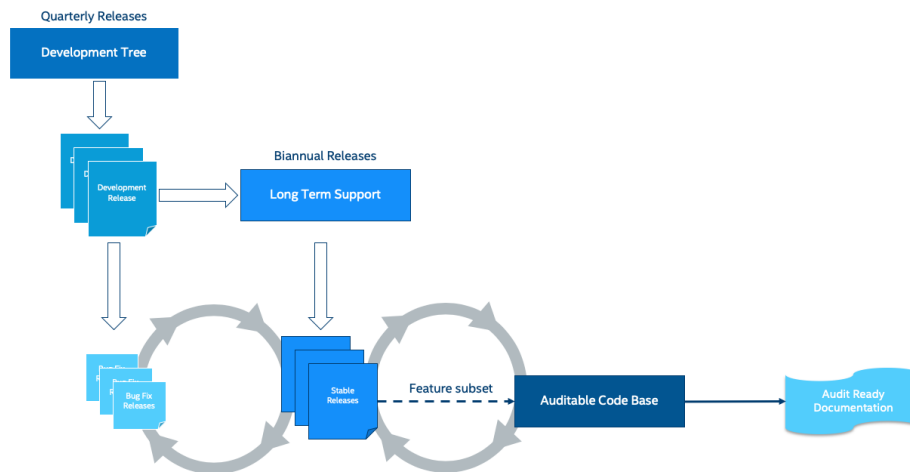

Fig. 2: Zephyr Code and Releases

### Long Term Support (LTS)

Long-term support releases are designed to be supported and maintained for an extended period and is the recommended release for products and the auditable branch used for certification.

An LTS release is defined as:

- **Product focused**
- **Extended Stabilisation period:** Allow for more testing and bug fixing
- **Stable APIs**
- **Quality Driven Process**
- **Long Term:** Maintained for an extended period of time (at least 2.5 years) overlapping previous LTS release for at least half a year.

**Product Focused** Zephyr LTS is the recommended release for product makers with an extended support and maintenance which includes general stability and bug fixes, security fixes.

An LTS includes both mature and new features. API and feature maturity is documented and tracked. The footprint and scope of mature and stable APIs expands as we move from one LTS to the next giving users access to bleeding edge features and new hardware while keeping a stable foundation that evolves over time.

**Extended Stabilisation Period** Zephyr LTS development cycle differs from regular releases and has an extended stabilization period. Feature freeze of regular releases happens 3-4 weeks before the scheduled release date. The stabilisation period for LTS is extended by 3 weeks with the feature freeze occurring 6-7 weeks before the anticipated release date. The time between code freeze and release date is extended in this case.

**Stable APIs** Zephyr LTS provides a stable and long-lived foundation for developing products. To guarantee stability of the APIs and the implementation of such APIs it is required that any release software that makes the core of the OS went through the Zephyr API lifecycle and stabilised over at least 2 releases. This guarantees that we release many of the highlighted and core features with mature and well-established implementations with stable APIs that are supported during the lifetime of the release LTS.

- API Freeze (LTS - 2)
  - All stable APIs need to be frozen 2 releases before an LTS. APIs can be extended with additional features, but the core implementation is not modified. This is valid for the following subsystems for example:
    - \* Device Drivers (i2c.h, spi.h)...
    - \* Kernel (k\_\*):
    - \* OS services (logging,debugging, ..)
    - \* DTS: API and bindings stability
    - \* Kconfig
  - New APIs for experimental features can be added at any time as long as they are standalone and documented as experimental or unstable features/APIs.
- Feature Freeze (LTS - 1) - No new features or overhaul/restructuring of code covering major LTS features.
  - Kernel + Base OS
  - Additional advertised LTS features
  - Auxiliary features on top of and/or extending the base OS and advertised LTS features can be added at any time and should be marked as experimental if applicable

**Quality Driven Process** The Zephyr project follows industry standards and processes with the goal of providing a quality oriented releases. This is achieved by providing the following products to track progress, integrity and quality of the software components provided by the project:

- Compliance with published coding guidelines, style guides and naming conventions and documentation of deviations.
- Regular static analysis on the complete tree using available commercial and open-source tools and documentation of deviations and false positives.
- Documented components and APIS
- Requirements Catalog
- Verification Plans
- Verification Reports
- Coverage Reports
- Requirements Traceability Matrix (RTM)
- SPDX License Reports

Each release is created with the above products to document the quality and the state of the software when it was released.

**Long Term Support and Maintenance** A Zephyr LTS release is published every 2 years and is branched and maintained independently from the main tree for at least 2.5 years after it was released. Support and maintenance for an LTS release stops at least half a year after the following LTS release is published.

Fig. 3: Long Term Support Release

Changes and fixes flow in both directions. However, changes from main branch to an LTS branch will be limited to fixes that apply to both branches and for existing features only.

All fixes for an LTS branch that apply to the mainline tree shall be submitted to mainline tree as well.

### Auditable Code Base

An auditable code base is to be established from a defined subset of Zephyr OS features and will be limited in scope. The LTS, development tree, and the auditable code bases shall be kept in sync after the audit branch is created, but with a more rigorous process in place for adding new features into the audit branch used for certification.

This process will be applied before new features move into the auditable code base.

The initial and subsequent certification targets will be decided by the Zephyr project governing board.

Processes to achieve selected certification will be determined by the Security and Safety Working Groups and coordinated with the TSC.

## 4.2.4 Release Procedure

This section documents the Release manager responsibilities so that it serves as a knowledge repository for Release managers.

### Milestones

The following graphic shows the timeline of phases and milestones associated with each release:

Fig. 4: Release milestones

This shows how the phases and milestones of one release overlap with those of the next release:

Fig. 5: Release milestones with planning

Table 3: Milestone Description

Milestone	Description	Definition
P0	Planning Kickoff	Start Entering Requirements
P1		TSC Agrees on Major Features and Schedule
M0	Merge Window Open	All features, Sized, and Assigned Merge Window Is Opened
M1	M1 Check-point	Major Features Ready for Code Reviews Test Plans Reviewed and Approved
M2	Feature Merge Window Close	Feature Freeze Feature Development Complete (including Code Reviews and Unit Tests Passing) P1 Stories Implemented Feature Merge Window Is Closed Test Development Complete Technical Documentation Created/Updated and Ready for Review CCB Control Starts
M3	Code Freeze	Code Freeze RC3 Tagged and Built
M4	Release	TSC Reviews the Release Criteria Report and Approves Release Final RC Tagged Make the Release

## Release Checklist

Each release has a GitHub issue associated with it that contains the full checklist. After a release is complete, a checklist for the next release is created.

## Tagging

The final release and each release candidate shall be tagged using the following steps:

**Note:** Tagging needs to be done via explicit git commands and not via GitHub’s release interface. The GitHub release interface does not generate annotated tags (it generates ‘lightweight’ tags regardless of release or pre-release). You should also upload your gpg public key to your GitHub account, since the instructions below involve creating signed tags. However, if you do not have a gpg public key you can opt to remove the `-s` option from the commands below.

## Release Candidate

**Note:** This section uses tagging 1.11.0-rc1 as an example, replace with the appropriate release candidate

version.

---

1. Update the version variables in the `VERSION` file located in the root of the Git repository to match the version for this release candidate. The `EXTRAVERSION` variable is used to identify the rc[RC Number] value for this candidate:

```
EXTRAVERSION = rc1
```

2. Post a PR with the updated `VERSION` file using release: Zephyr 1.11.0-rc1 as the commit subject. Merge the PR after successful CI.
3. Tag and push the version, using an annotated tag:

```
$ git pull
$ git tag -s -m "Zephyr 1.11.0-rc1" v1.11.0-rc1
$ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0-rc1
```

4. Once the tag is pushed, a github action will create a draft release in Github with a shortlog since the last tag. The action will also create a SPDX manifest of the Zephyr tree and will add the file as an asset in the release.

Go to the draft release that was created and edit as needed. If this step fails for a reason, it can be done manually following the steps below:

1. Create a shortlog of changes between the previous release (use rc1..rc2 between release candidates):

```
$ git shortlog v1.10.0..v1.11.0-rc1
```

2. Find the new tag at the top of the releases page and edit the release with the `Edit tag` button with the following:
  - Name it Zephyr 1.11.0-rc1
  - Copy the shortlog into the release notes textbox (*don't forget to quote it properly so it shows as unformatted text in Markdown*)
  - Check the "This is a pre-release" checkbox

5. Send an email to the mailing lists (announce and devel) with a link to the release

#### Final Release

---

**Note:** This section uses tagging 1.11.0 as an example, replace with the appropriate final release version.

---

When all final release criteria has been met and the final release notes have been approved and merged into the repository, the final release version will be set and repository tagged using the following procedure:

1. Update the version variables in the `VERSION` file located in the root of the Git repository. Set `EXTRAVERSION` variable to an empty string to indicate final release:

```
EXTRAVERSION =
```

2. Post a PR with the updated `VERSION` file using release: Zephyr 1.11.0 as the commit subject. Merge the PR after successful CI.
3. Tag and push the version, using two annotated tags:

```
$ git pull
$ git tag -s -m "Zephyr 1.11.0" v1.11.0
$ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0
```

(continues on next page)

(continued from previous page)

```
# This is the tag that will represent the release on GitHub, so that
# the file you can download is named ``zephyr-v1.11.0.zip`` and not
# just ``v1.11.0.zip``
$ git tag -s -m "Zephyr 1.11.0" zephyr-v1.11.0
$ git push git@github.com:zephyrproject-rtos/zephyr.git zephyr-v1.11.0
```

4. Find the new `zephyr-v1.11.0` tag at the top of the releases page and edit the release with the Edit tag button with the following:
  - Name it Zephyr 1.11.0
  - Copy the full content of `docs/releases/release-notes-1.11.rst` into the release notes textbox
5. Send an email to the mailing lists (`announce` and `devel`) with a link to the release

### Listing all closed GitHub issues

The release notes for a final release contain the list of GitHub issues that have been closed during the development process of that release.

In order to obtain the list of issues closed during the release development cycle you can do the following:

1. Look for the last release before the current one and find the day it was tagged:

```
$ git show -s --format=%ci zephyr-v1.10.0
tag zephyr-v1.10.0
Tagger: Kumar Gala <kumar.gala@linaro.org>

Zephyr 1.10.0
2017-12-08 13:32:22 -0600
```

2. Use available release tools to list all the issues that have been closed between that date and the day of the release.

## 4.3 Feature Tracking

For feature tracking we use Github labels to classify new features and enhancements. The following is the description of each category:

**Enhancement** Changes to existing features that are not considered a bug and would not block a release. This is an incremental enhancement to a feature that already exists in Zephyr.

**Feature request** A request for the implementation or inclusion of a new unit of functionality that is not part of any release plans yet, that has not been vetted, and needs further discussion and details.

**Feature** A committed and planned unit of functionality with a detailed design and implementation proposal and an owner. Features must go through an RFC process and must be vetted and discussed in the TSC before a target milestone is set.

**Hardware Support** A request or plan to port an existing feature or enhancement to a particular hardware platform. This ranges from porting Zephyr itself to a new architecture, SoC or board to adding an implementation of a peripheral driver API for an existing hardware platform.

**Meta** A label to group other GitHub issues that are part of a single feature or unit of work.

The following workflow should be used to process features:.

This is the formal way for asking for a new feature in Zephyr and indicating its importance to the project. Often, the requester may have a readiness and willingness to drive implementation of the feature in an upcoming release, and should assign the request to themselves. If not though, an owner will be assigned after evaluation by the TSC. A feature request can also have a companion RFC with more details on the feature and a proposed design or implementation.

- Label new features requests as `feature-request`
- The TSC discusses new `feature-request` items regularly and triages them. Items are examined for similarity with existing features, how they fit with the project goals and other timeline considerations. The priority is determined as follows:
  - High = Next milestone
  - Medium = As soon as possible
  - Low = Best effort
- After the initial discussion and triaging, the label is moved from `feature-request` to `feature` with the target milestone and an assignee.

All items marked as `feature-request` are non-binding and those without an assignee are open for grabs, meaning that they can be picked up and implemented by any project member or the community. You should contact an assigned owner if you'd like to discuss or contribute to that feature's implementation

### 4.3.1 Proposals and RFCs

Many changes, including bug fixes and documentation improvements can be implemented and reviewed via the normal GitHub pull request workflow.

Many changes however are “substantial” and need to go through a design process and produce a consensus among the project stakeholders.

The “RFC” (request for comments) process is intended to provide a consistent and controlled path for new features to enter the project.

Contributors and project stakeholders should consider using this process if they intend to make “substantial” changes to Zephyr or its documentation. Some examples that would benefit from an RFC are:

- A new feature that creates new API surface area, and would require a feature flag if introduced.
- The modification of an existing stable API
- The removal of features that already shipped as part of Zephyr.
- The introduction of new idiomatic usage or conventions, even if they do not include code changes to Zephyr itself.

The RFC process is a great opportunity to get more eyeballs on proposals coming from contributors before it becomes a part of Zephyr. Quite often, even proposals that seem “obvious” can be significantly improved once a wider group of interested people have a chance to weigh in.

The RFC process can also be helpful to encourage discussions about a proposed feature as it is being designed, and incorporate important constraints into the design while it's easier to change, before the design has been fully implemented.

Some changes do not require an RFC:

- Rephrasing, reorganizing or refactoring
- Addition or removal of warnings
- Addition of new boards, SoCs or drivers to existing subsystems
- ...

The process in itself consists in creating a GitHub issue with the [RFC label](#) that documents the proposal thoroughly. There is an [RFC template](#) included in the main Zephyr GitHub repository that serves as a guideline to write a new RFC.

As with Pull Requests, RFCs might require discussion in the context of one of the [Zephyr meetings](#) in order to move it forward in cases where there is either disagreement or not enough voiced opinions in order to proceed. Make sure to either label it appropriately or include it in the corresponding GitHub project in order for it to be examined during the next meeting.

### 4.3.2 Roadmap and Release Plans

Project roadmaps and release plans are both important tools for the project, but they have very different purposes and should not be confused. A project roadmap communicates the high-level overview of a project's strategy, while a release plan is a tactical document designed to capture and track the features planned for upcoming releases.

- The project roadmap communicates the why; a release plan details the what
- A release plan spans only a few months; a product roadmap might cover a year or more

#### Project Roadmap

The project roadmap should serve as a high-level, visual summary of the project's strategic objectives and expectations.

If built properly, the roadmap can be a valuable tool for several reasons. It can help the project present its plan in a compelling way to existing and new stakeholders, to help recruit new members and it can be a helpful resource the team and community can refer to throughout the project's development, to ensure they are still executing according to plan.

As such, the roadmap should contain only strategic-level details, major project themes, epics, and goals.

#### Release Plans

The release plan comes into play when the project roadmap's high-level strategy is translated into an actionable plan built on specific features, enhancements, and fixes that need to go into a specific release or milestone.

The release plan communicates those features and enhancements slated for your project's next release (or the next few releases). So it acts as more of a project plan, breaking the big ideas down into smaller projects the community and main stakeholders of the project can make progress on.

Items labeled as `features` are short or long term release items that shall have an assignee and a milestone set.

## 4.4 Code Flow and Branches

### 4.4.1 Introduction

The zephyr Git repository has three types of branches:

**main** Which contains the latest state of development

**topic-\*** Topic branches that are used for shared development of a new feature

**vx.y-branch** Branches which track maintenance releases based on a major release

Development in topic branches before features go to mainline allows teams to work independently on a subsystem or a feature, improves efficiency and turnaround time, and encourages collaboration and streamlines communication between developers.

Changes submitted to a development topic branch can evolve and improve incrementally in a branch, before they are submitted to the mainline tree for final integration.

By dedicating an isolated branch to complex features, it's possible to initiate in-depth discussions around new additions before integrating them into the official project.

#### 4.4.2 Roles and Responsibilities

Development topic branch owners have the following responsibilities:

- Use the infrastructure and tools provided by the project (GitHub, Git)
- Review changes coming from team members and request review from branch owners when submitting changes.
- Keep the branch in sync with upstream and update on a regular basis.
- Push changes frequently to upstream using the following methods:
  - GitHub pull requests: for example, when reviews have not been done in the local branch (one-man branch).
  - Merge requests: When a set of changes has been done in a local branch and has been reviewed and tested in a topic branch.

### 4.5 Modifying Contributions made by other developers

#### 4.5.1 Scenarios

Zephyr contributors and collaborators are encouraged to assist as reviewers in pull requests, so that patches may be approved and merged to Zephyr's main branch as part of the original pull requests. The authors of the pull requests are responsible for amending their original commits following the review process.

There are occasions, however, when a contributor might need to modify patches included in pull requests that are submitted by other Zephyr contributors. For instance, this is the case when:

- a developer cherry-picks commits submitted by other contributors into their own pull requests in order to:
  - integrate useful content which is part of a stale pull request, or
  - get content merged to the project's main branch as part of a larger patch
- a developer pushes to a branch or pull request opened by another contributor in order to:
  - assist in updating pull requests in order to get the patches merged to the project's main branch
  - drive stale pull requests to completion so they can be merged

#### 4.5.2 Accepted policies

A developer who intends to cherry-pick and potentially modify patches sent by another contributor shall:

- clarify in their pull request the reason for cherry-picking the patches, instead of assisting in getting the patches merged in their original pull request, and
- invite the original author of the patches to their pull request review.

A developer who intends to force-push to a branch or pull request of another Zephyr contributor shall clarify in the pull request the reason for pushing and for modifying the existing patches (e.g. stating that it is done to drive the pull request review to completion, when the pull request author is not able to do so).

---

**Note:** Developers should try to limit the above practice to pull requests identified as *stale*. Read about how to identify pull requests as stale in [development processes and tools](#)

---

If the original patches are substantially modified, the developer can either:

- (preferably) reach out to the original author and request them to acknowledge that the modified patches may be merged while having the original sign-off line and author identity, or
- submit the modified patches as their *own* work (i.e. with their *own* sign-off line and author identity). In this case, the developer shall identify in the commit message(s) the original source the submitted work is based on (mentioning, for example, the original PR number).

---

**Note:** Contributors should uncheck the box “*Allow Edits By Maintainers*” to indicate that they do not wish their patches to be amended, inside their original branch or pull request, by other Zephyr developers.

---

## 4.6 Development Environment and Tools

### 4.6.1 Code Review

GitHub is intended to provide a framework for reviewing every commit before it is accepted into the code base. Changes, in the form of Pull Requests (PR) are uploaded to GitHub but don't actually become a part of the project until they've been reviewed, passed a series of checks (CI), and are approved by maintainers. GitHub is used to support the standard open source practice of submitting patches, which are then reviewed by the project members before being applied to the code base.

Pull requests should be appropriately [labeled](#), and linked to any relevant [bug or feature tracking issues](#).

The Zephyr project uses GitHub for code reviews and Git tree management. When submitting a change or an enhancement to any Zephyr component, a developer should use GitHub. GitHub automatically assigns a responsible reviewer on a component basis, as defined in the [CODEOWNERS](#) file stored with the code tree in the Zephyr project repository. A limited set of release managers are allowed to merge a pull request into the main branch once reviews are complete.

#### Give reviewers time to review before code merge

The Zephyr project is a global project that is not tied to a certain geography or timezone. We have developers and contributors from across the globe. When changes are proposed using pull request, we need to allow for a minimal review time to give developers and contributors the opportunity to review and comment on changes. There are different categories of changes and we know that some changes do require reviews by subject matter experts and owners of the subsystem being changed. Many changes fall under the “trivial” category that can be addressed with general reviews and do not need to be queued for a maintainer or code-owner review. Additionally, some changes might require further discussions and a decision by the TSC or the Security working group. To summarize the above, the diagram below proposes minimal review times for each category:

#### Workflow

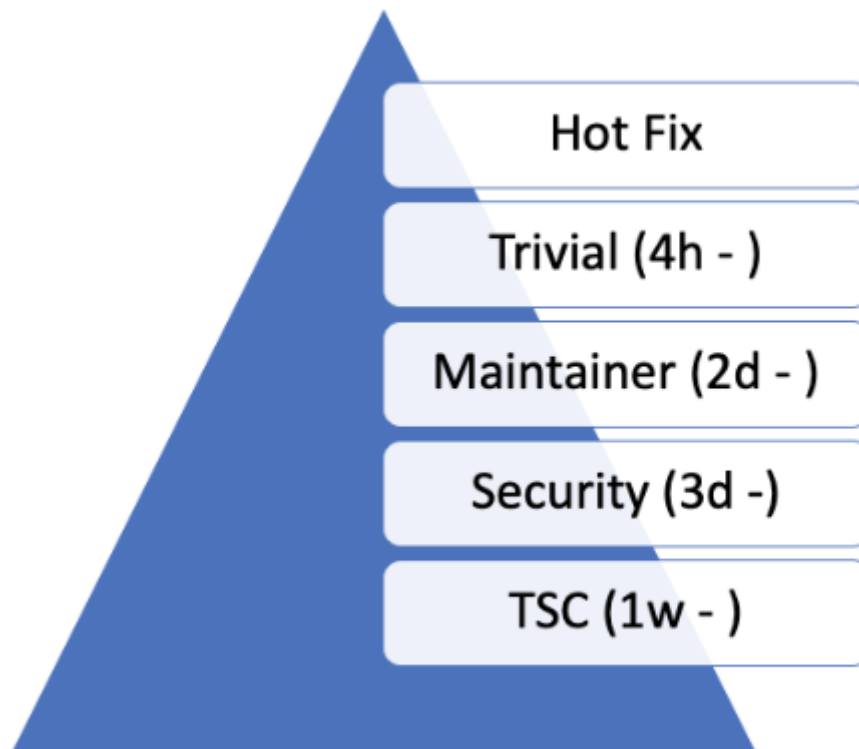

Fig. 6: Pull request classes

- An author of a change can suggest in his pull-request which category a change should belong to. A project maintainers or TSC member monitoring the inflow of changes can change the label of a pull request by adding a comment justifying why a change should belong to another category.
- The project will use the label system to categorize the pull requests.
- Changes should not be merged before the minimal time has expired.

### Categories/Labels

**Hotfix** Any change that is a fix to an issue that blocks developers from doing their daily work, for example CI breakage, Test breakage, Minor documentation fixes that impact the user experience.

Such fixes can be merged at any time after they have passed CI checks. Depending on the fix, severity, and availability of someone to review them (other than the author) they can be merged with justification without review by one of the project owners.

**Trivial** Trivial changes are those that appear obvious enough and do not require maintainer or code-owner involvement. Such changes should not change the logic or the design of a subsystem or component. For example a trivial change can be:

- Documentation changes
- Configuration changes
- Minor Build System tweaks
- Minor optimization to code logic without changing the logic

- Test changes and fixes
- Sample modifications to support additional configuration or boards etc.

**Maintainer** Any changes that touch the logic or the original design of a subsystem or component will need to be reviewed by the code owner or the designated subsystem maintainer. If the code changes is initiated by a contributor or developer other than the owner the pull request needs to be assigned to the code owner who will have to drive the pull request to a mergeable state by giving feedback to the author and asking for more reviews from other developers.

**Security** Changes that appear to have an impact to the overall security of the system need to be reviewed by a security expert from the security working group.

**TSC and Working Groups** Changes that introduce new features or functionality or change the way the overall system works need to be reviewed by the TSC or the responsible Working Group. For example for [stable API changes](#), the proposal needs to be presented in the API meeting so that the relevant stakeholders are made aware of the change.

### A Pull-Request should have an Assignee

- An assignee to a pull request should not be the same as the author of the pull-request
- An assignee to a pull request is responsible for driving the pull request to a mergeable state
- An assignee is responsible for dismissing stale reviews and seeking reviews from additional developers and contributors
- Pull requests should not be merged without an approval by the assignee.

### Pull Request should not be merged by author without review

All pull requests need to be reviewed and should not be merged by the author without a review. The following exceptions apply:

- Hot fixes: Fixing CI issues, reverts, and system breakage
- Release related changes: Changing version file, applying tags and release related activities without any code changes.

Developers and contributors should always seek review, however there are cases when reviewers are not available and there is a need to get a code change into the tree as soon as possible.

### Reviewers shall not ‘Request Changes’ without comments or justification

Any change requests (-1) on a pull request have to be justified. A reviewer should avoid blocking a pull-request with no justification. If a reviewer feels that a change should not be merged without their review, then: Request change of the category: for example:

- Trivial -> Maintainer
- Assign Pull Request to yourself, this will mean that a pull request should not be merged without your approval.

### **Pull Requests should have at least 2 approvals before they are merged**

A pull-request shall be merged only with two positive reviews (approval). Beside the person merging the pull-request (merging != approval), two additional approvals are required to be able to merge a pull request. The person merging the request can merge without approving or approve and merge to get to the 2 approvals required.

### **Reviewers should keep track of pull requests they have provided feedback to**

If a reviewer has requested changes in a pull request, he or she should monitor the state of the pull request and/or respond to mention requests to see if his feedback has been addressed. Failing to do so, negative reviews shall be dismissed by the assignee or an owner of the repository. Reviews will be dismissed following the criteria below:

- The feedback or concerns were visibly addressed by the author
- The reviewer did not revisit the pull request after 2 week and multiple pings by the author
- The review is unrelated to the code change or asking for unjustified structural changes such as:
  - Split the PR
  - Split the commits
  - Can you fix this unrelated code that happens to appear in the diff
  - Can you fix unrelated issues
  - Etc.

### **Closing Stale Issues and Pull Requests**

- The Pull requests and issues sections on Github are NOT discussion forums. They are items that we need to execute and drive to closure. Use the mailing lists for discussions.
- In case of both issues and pull-requests the original poster needs to respond to questions and provide clarifications regarding the issue or the change. After one week without a response to a request, a second attempt to elicit a response from the contributor will be made. After one more week without a response the item may be closed (draft and DNM tagged pull requests are excluded).

## **4.6.2 Continuous Integration**

All changes submitted to GitHub are subject to tests that are run on emulated platforms and architectures to identify breakage and regressions that can be immediately identified. Testing using Twister additionally performs build tests of all boards and platforms. Documentation changes are also verified through review and build testing to verify doc generation will be successful.

Any failures found during the CI test run will result in a negative review assigned automatically by the CI system. Developers are expected to fix issues and rework their patches and submit again.

The CI infrastructure currently runs the following tests:

- Run “checkpatch” for code style issues (can vote -1 on errors; see note)
- Gitlint: Git commit style based on project requirements
- License Check: Check for conflicting licenses
- Run “twister” script
  - Run kernel tests in QEMU (can vote -1 on errors)
  - Build various samples for different boards (can vote -1 on errors)

- Verify documentation builds correctly.

---

**Note:** “checkpatch” is a Perl script that uses regular expressions to extract information that requires a C language parser to process accurately. As such it sometimes issues false positives. Known cases include constructs like:

```
static uint8_t __aligned(PAGE_SIZE) page_pool[PAGE_SIZE * POOL_PAGES];
IOPCTL_Type *base = config->base;
```

Both lines produce a diagnostic regarding spaces around the \* operator: the first is misidentified as a pointer type declaration that would be correct as `PAGE_SIZE * POOL_PAGES` while the second is misidentified as a multiplication expression that would be correct as `IOPCTL_Type * base`.

Maintainers can override the -1 in cases where the CI infrastructure gets the wrong answer.

---

### 4.6.3 Labeling issues and pull requests in GitHub

The project uses GitHub issues and pull requests (PRs) to track and manage daily and long-term work and contributions to the Zephyr project. We use GitHub **labels** to classify and organize these issues and PRs by area, type, priority, and more, making it easier to find and report on relevant items.

All GitHub issues or pull requests must be appropriately labeled. Issues and PRs often have multiple labels assigned, to help classify them in the different available categories. When reviewing a PR, if it has missing or incorrect labels, maintainers shall fix it.

This saves us all time when searching, reduces the chances of the PR or issue being forgotten, speeds up reviewing, avoids duplicate issue reports, etc.

These are the labels we currently have, grouped by type:

#### Area

La-bels	Area:*
Ap-plica-ble to	PRs and issues
De-scrip-tion	Indicates subsystems (e.g., Kernel, I2C, Memory Management), project functions (e.g., Debugging, Documentation, Process), or other categories (e.g., Coding Style, MISRA-C) affected by the bug or pull request.

An area maintainer should be able to filter by an area label and find all issues and PRs which relate to that area.

#### Platform

Labels	Platform:*
Applicable to	PRs and issues
Description	An issue or PR which affects only a particular platform

### To be discussed in a meeting

Labels	dev-review, TSC
Applicable to	PRs and issues
Description	The issue is to be discussed in the following <a href="#">dev-review/TSC meeting</a> if time permits

### Stable API changes

Labels	Stable API Change
Applicable to	PRs and issues
Description	The issue or PR describes a change to a stable API. See additional information in <a href="#">Introducing incompatible changes</a>

### Minimum PR review time

Labels	Hot Fix, Trivial, Maintainer, Security Review, TSC
Applicable to	PRs only
Description	Depending on the PR complexity, an indication of how long a merge should be held to ensure proper review. See <a href="#">review process</a>

### Issue priority labels

Labels	priority:{high medium low}
Applicable to	Issues only
Description	To classify the impact and importance of a bug or <a href="#">feature</a>

Note: Issue priorities are generally set or changed during the bug-triage or TSC meetings.

### Miscellaneous labels

#### For both PRs and issues

Bug	The issue is a bug, or the PR is fixing a bug
Coverity	A Coverity detected issue or its fix
Waiting for response	The Zephyr developers are waiting for the submitter to respond to a question, or address an issue.
Blocked	Blocked by another PR or issue
In progress	For PRs: is work in progress and should not be merged yet. For issues: Is being worked on
RFC	The author would like input from the community. For a PR it should be considered a draft
LTS	Long term release branch related
EXT	Related to an external component (in ext/)

### PR only labels

DNM	This PR should not be merged (Do Not Merge). For work in progress, GitHub “draft” PRs are preferred
Stale PR	PR which seems abandoned, and requires attention by the author
Needs review	The PR needs attention from the maintainers
Backport	The PR is a backport or should be backported
Licensing	The PR has licensing issues which require a licensing expert to review it

### Issue only labels

Regression	Something, which was working, but does not anymore (bug subtype)
Question	This issue is a question to the Zephyr developers
Enhancement	Changes/Updates/Additions to existing <i>features</i>
Feature request	A request for a new <i>feature</i>
Feature	A <i>planned feature</i> with a milestone
Duplicate	This issue is a duplicate of another issue (please specify)
Good first issue	Good for a first time contributor to take
Release Notes	Issues that need to be mentioned in release notes as known issues with additional information

Any issue must be classified and labeled as either Bug, Question, Enhancement, Feature, or Feature Request. More information on how feature requests are handled and become features can be found in [Feature Tracking](#).

## 4.7 Bug Reporting

To maintain traceability and relation between proposals, changes, features, and issues, it is recommended to cross-reference source code commits with the relevant GitHub issues and vice versa. Any changes that originate from a tracked feature or issue should contain a reference to the feature by mentioning the corresponding issue or pull-request identifiers.

At any time it should be possible to establish the origin of a change and the reason behind it by following the references in the code.

### 4.7.1 Reporting a regression issue

It could happen that the issue being reported is identified as a regression, as the use case is known to be working on earlier commit or release. In this case, providing directly the guilty commit when submitting the bug gains a lot of time in the eventual bug fixing.

To identify the commit causing the regression, several methods could be used, but tree bisecting method is an efficient one that doesn't require deep code expertise and can be used by every one.

For this, `git bisect` is the recommended tool.

Recommendations on the process:

- Run `west update` on each bisection step.
- Once the bisection is over and a culprit identified, verify manually the result.

## 4.8 Communication and Collaboration

The [Zephyr project mailing lists](#) are used as the primary communication tool by project members, contributors, and the community. The mailing list is open for topics related to the project and should be used for collaboration among team members working on the same feature or subsystem or for discussing project direction and daily development of the code base. In general, bug reports and issues should be entered and tracked in the bug tracking system ([GitHub Issues](#)) and not broadcasted to the mailing list, the same applies to code reviews. Code should be submitted to GitHub using the appropriate tools.

## 4.9 Code Documentation

### 4.9.1 API Documentation

Well documented APIs enhance the experience for developers and are an essential requirement for defining an API's success. Doxygen is a general purpose documentation tool that the zephyr project uses for documenting APIs. It generates either an on-line documentation browser (in HTML) and/or provides input for other tools that is used to generate a reference manual from documented source files. In particular, doxygen's XML output is used as an input when producing the Zephyr project's online documentation.

### 4.9.2 Reference to Requirements

APIs for the most part document the implementation of requirements or advertised features and can be traced back to features. We use the API documentation as the main interface to trace implementation back to documented features. This is done using custom `_doxygen_` tags that reference requirements maintained somewhere else in a requirement catalogue.

### 4.9.3 Test Documentation

To help understand what each test does and which functionality it tests we also document all test code using the same tools and in the same context and generate documentation for all unit and integration tests maintained in the same environment. Tests are documented using references to the APIs or functionality they validate by creating a link back to the APIs and by adding a reference to the original requirements.

### 4.9.4 Documentation Guidelines

#### Test Code

The Zephyr project uses several test methodologies, the most common being the [Ztest framework](#). Test documentation should only be done on the entry test functions (usually prefixed with `test_`) and those that are called directly by the Ztest framework. Those tests are going to appear in test reports and using their name and identifier is the best way to identify them and trace back to them from requirements.

Test documentation should not interfere with the actual API documentation and needs to follow a new structure to avoid confusion. Using a consistent naming scheme and following a well-defined structure we will be able to group this documentation in its own module and identify it uniquely when parsing test data for traceability reports. Here are a few guidelines to be followed:

- All test code documentation should be grouped under the `all_tests` doxygen group
- All test documentation should be under doxygen groups that are prefixed with `tests_`

The custom doxygen `@verify` directive signifies that a test verifies a requirement:

```
/**
 * @brief Tests for the Semaphore kernel object
 * @defgroup kernel_semaphore_tests Semaphore
 * @ingroup all_tests
 * @{
 */

...
/**
 * @brief A brief description of the tests
 * Some details about the test
 * more details
 *
 * @verify{@req{1111}}
 */
void test_sema_thread2thread(void)
{
    ...
}
...

/**
 * @}
 */
```

To get coverage of how an implementation or a piece of code satisfies a requirements, we use the `satisfy` alias in doxygen:

```
/**
 * @brief Give a semaphore.
 *
 * This routine gives @a sem, unless the semaphore is already at its maximum
 * permitted count.
 *
 * @note Can be called by ISRs.
 *
 * @param sem Address of the semaphore.
 *
 * @return N/A
 * @satisfy{@req{015}}
 */
__syscall void k_sem_give(struct k_sem *sem);
```

To generate the matrix, you will first need to build the documentation, specifically you will need to build the doxygen XML output:

```
$ make doxygen
```

Parse the generated XML data from doxygen to generate the traceability matrix.

The Zephyr project defines a development process workflow using GitHub **Issues** to track feature, enhancement, and bug reports together with GitHub **Pull Requests** (PRs) for submitting and reviewing changes. Zephyr community members work together to review these Issues and PRs, managing feature enhancements and quality improvements of Zephyr through its regular releases, as outlined in the [program management overview](#).

We can only manage the volume of Issues and PRs, by requiring timely reviews, feedback, and responses from the community and contributors, both for initial submissions and for followup questions and clarifications. Read about the project's [development processes and tools](#) and specifics about [review timelines](#) to

learn about the project's goals and guidelines for our active developer community.

[TSC Project Roles](#) describes in detail the Zephyr project roles and associated permissions with respect to the development process workflow.

## 4.10 Terminology

- **mainline:** The main tree where the core functionality and core features are being developed.
- **subsystem/feature branch:** is a branch within the same repository. In our case, we will use the term branch also when referencing branches not in the same repository, which are a copy of a repository sharing the same history.
- **upstream:** A parent branch the source code is based on. This is the branch you pull from and push to, basically your upstream.
- **LTS:** Long Term Support

## Chapter 5

# Build and Configuration Systems

### 5.1 Build System (CMake)

CMake is used to build your application together with the Zephyr kernel. A CMake build is done in two stages. The first stage is called **configuration**. During configuration, the CMakeLists.txt build scripts are executed. After configuration is finished, CMake has an internal model of the Zephyr build, and can generate build scripts that are native to the host platform.

CMake supports generating scripts for several build systems, but only Ninja and Make are tested and supported by Zephyr. After configuration, you begin the **build** stage by executing the generated build scripts. These build scripts can recompile the application without involving CMake following most code changes. However, after certain changes, the configuration step must be executed again before building. The build scripts can detect some of these situations and reconfigure automatically, but there are cases when this must be done manually.

Zephyr uses CMake's concept of a 'target' to organize the build. A target can be an executable, a library, or a generated file. For application developers, the library target is the most important to understand. All source code that goes into a Zephyr build does so by being included in a library target, even application code.

Library targets have source code, that is added through CMakeLists.txt build scripts like this:

```
target_sources(app PRIVATE src/main.c)
```

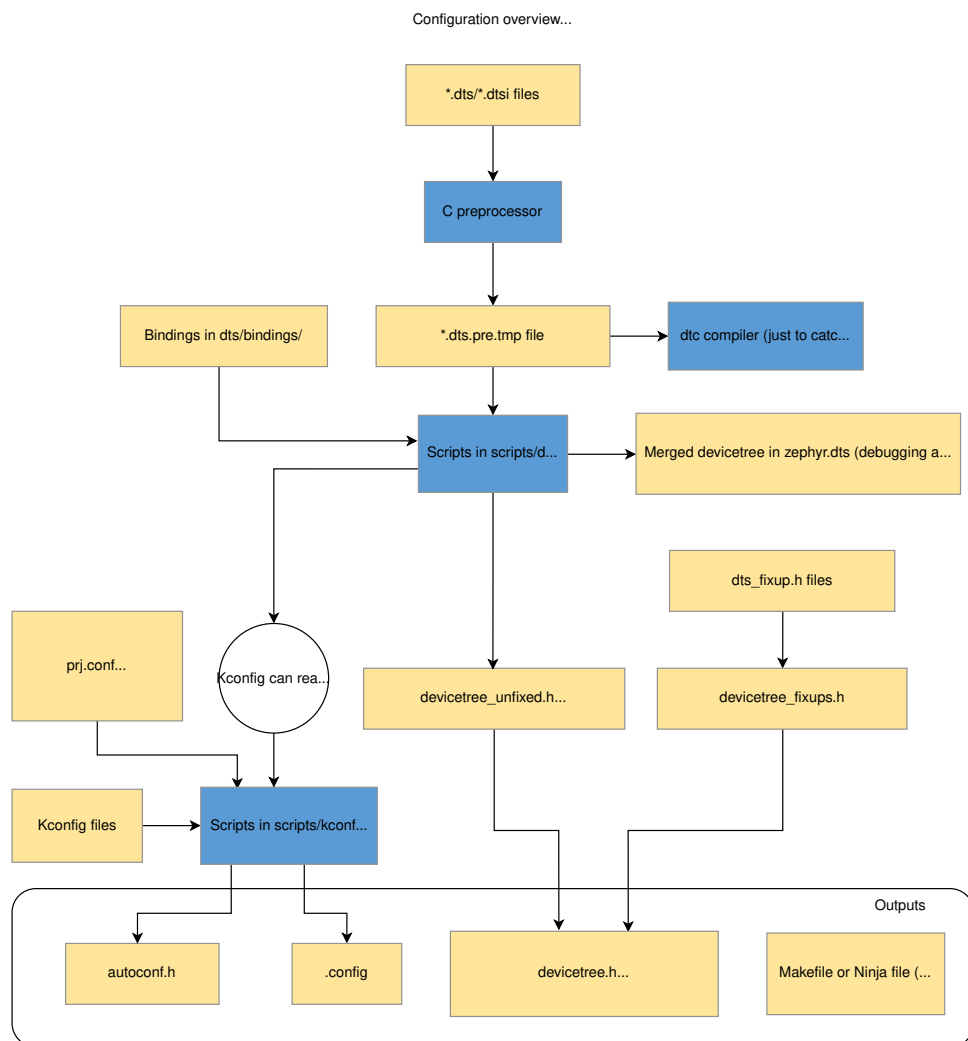

In the above CMakeLists.txt, an existing library target named `app` is configured to include the source file `src/main.c`. The `PRIVATE` keyword indicates that we are modifying the internals of how the library is being built. Using the keyword `PUBLIC` would modify how other libraries that link with `app` are built. In this case, using `PUBLIC` would cause libraries that link with `app` to also include the source file `src/main.c`, behavior that we surely do not want. The `PUBLIC` keyword could however be useful when modifying the include paths of a target library.

#### 5.1.1 Build and Configuration Phases

The Zephyr build process can be divided into two main phases: a configuration phase (driven by CMake) and a build phase (driven by Make or Ninja).

##### Configuration Phase

The configuration phase begins when the user invokes *CMake*, specifying a source application directory and a board target.

CMake begins by processing the `CMakeLists.txt` file in the application directory, which refers to the `CMakeLists.txt` file in the Zephyr top-level directory, which in turn refers to `CMakeLists.txt` files throughout the build tree (directly and indirectly). Its primary output is a set of Makefiles or Ninja files to drive the build process, but the CMake scripts also do some processing of their own:

**Devicetree** `*.dts` (*devicetree source*) and `*.dtsi` (*devicetree source include*) files are collected from the target's architecture, SoC, board, and application directories.

`*.dtsi` files are included by `*.dts` files via the C preprocessor (often abbreviated *cpp*, which should not be confused with C++). The C preprocessor is also used to merge in any devicetree `*.overlay` files, and to expand macros in `*.dts`, `*.dtsi`, and `*.overlay` files.

The preprocessed devicetree sources (stored in `*.dts.pre.tmp`) are parsed by `gen_defines.py` to generate a `devicetree_unfixed.h` header with preprocessor macros.

As a debugging aid, `gen_defines.py` writes the final devicetree to `zephyr.dts`. This file is just for reference. It is not used anywhere.

The `dtc` devicetree compiler also gets run on the preprocessed devicetree sources to catch any extra warnings and errors generated by it. The output from `dtc` is unused otherwise.

The above is just a brief overview. For more information on devicetree, see [Devicetree Guide](#).

**Devicetree fixups** Files named `dts_fixup.h` from the target's architecture, SoC, board, and application directories are concatenated into a single `devicetree_fixups.h` file. `dts_fixup.h` files are used to rename generated macros to names expected by the source code.

Source code accesses preprocessor macros generated from devicetree by including the `devicetree.h` header, which includes `devicetree_unfixed.h` and `devicetree_fixups.h`.

**Kconfig** Kconfig files define available configuration options for the target architecture, SoC, board, and application, as well as dependencies between options.

Kconfig configurations are stored in *configuration files*. The initial configuration is generated by merging configuration fragments from the board and application (e.g. `prj.conf`).

The output from Kconfig is an `autoconf.h` header with preprocessor assignments, and a `.config` file that acts both as a saved configuration and as configuration output (used by CMake).

Information from devicetree is available to Kconfig, through the functions defined in `kconfigfunctions.py`.

See [the Kconfig section of the manual](#) for more information.

## Build Phase

The build phase begins when the user invokes `make` or `ninja`. Its ultimate output is a complete Zephyr application in a format suitable for loading/flashing on the desired target board (`zephyr.elf`, `zephyr.hex`, etc.) The build phase can be broken down, conceptually, into four stages: the pre-build, first-pass binary, final binary, and post-processing.

**Pre-build** Pre-build occurs before any source files are compiled, because during this phase header files used by the source files are generated.

**Offset generation** Access to high-level data structures and members is sometimes required when the definitions of those structures is not immediately accessible (e.g., assembly language). The generation of `offsets.h` (by `gen_offset_header.py`) facilitates this.

**System call boilerplate** The `gen_syscall.py` and `parse_syscalls.py` scripts work together to bind potential system call functions with their implementations.

**First-pass binary** Compilation proper begins with the first-pass binary. Source files (C and assembly) are collected from various subsystems (which ones is decided during the configuration phase), and compiled into archives (with reference to header files in the tree, as well as those generated during the configuration phase and the pre-build stage).

If memory protection is enabled, then:

**Partition grouping** The *gen\_app\_partitions.py* script scans all the generated archives and outputs linker scripts to ensure that application partitions are properly grouped and aligned for the target’s memory protection hardware.

Then *cxx* is used to combine linker script fragments from the target's architecture/SoC, the kernel tree, optionally the partition output if memory protection is enabled, and any other fragments selected during the configuration process, into a *linker.cmd* file. The compiled archives are then linked with *ld* as specified in the *linker.cmd*.

In some configurations, this is the final binary, and the next stage is skipped.

**Final binary** The binary from the previous stage is incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

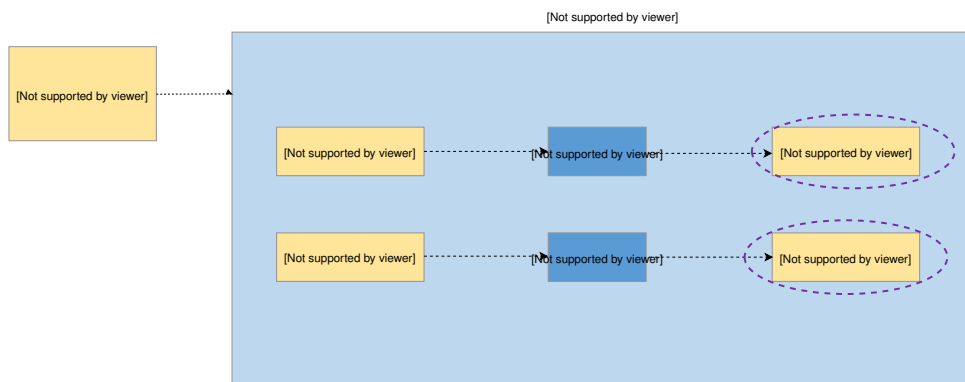

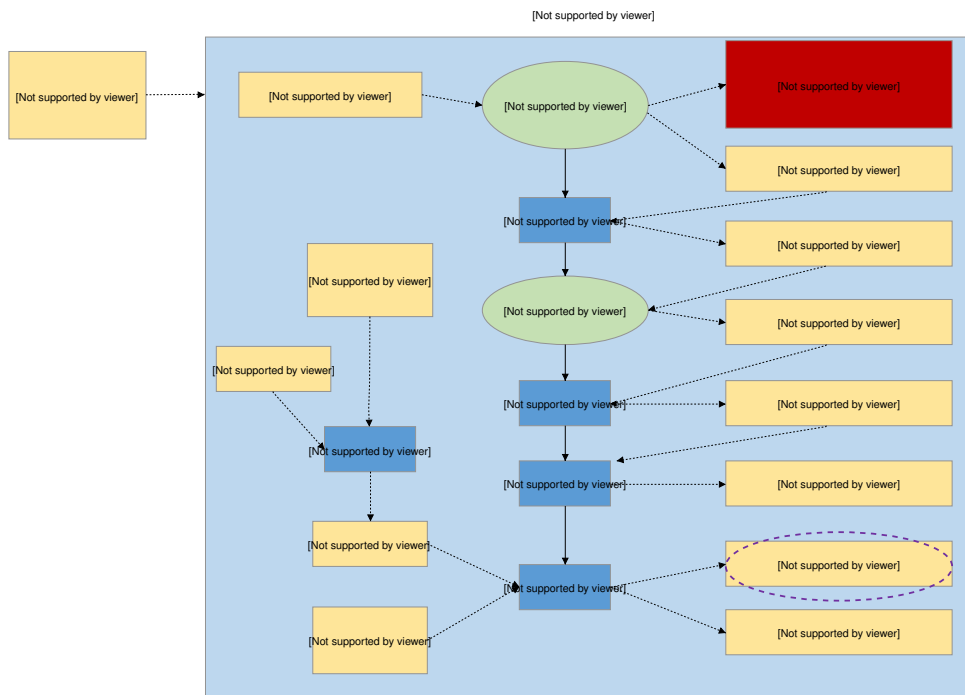

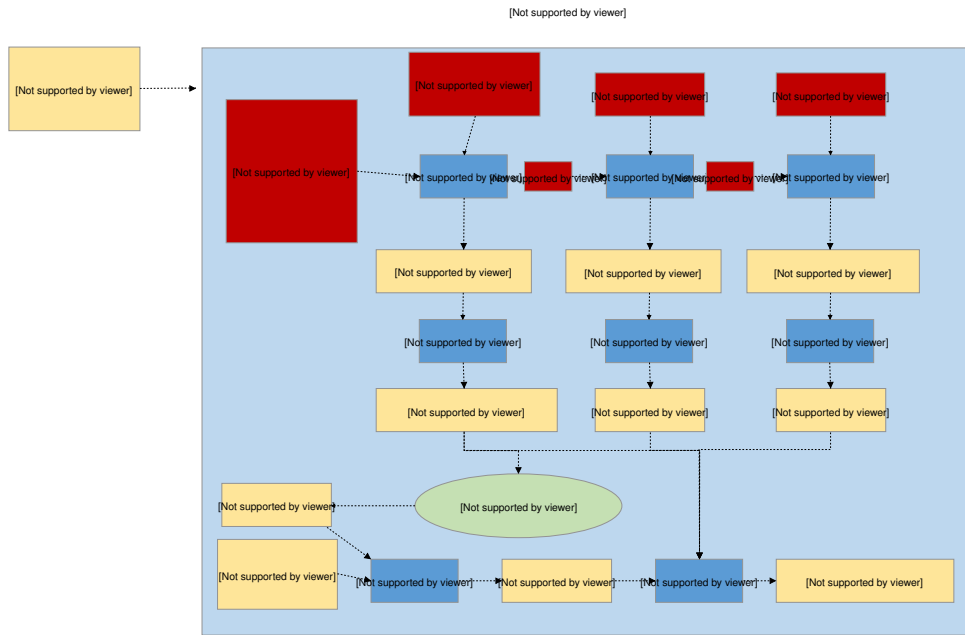

**Device dependencies** The *gen\_handles.py* script scans the first-pass binary to determine relationships between devices that were recorded from devicetree data, and replaces the encoded relationships with values that are optimized to locate the devices actually present in the application.

When *User Mode* is enabled:

**Kernel object hashing** The `gen_kobject_list.py` scans the *ELF DWARF* debug data to find the address of the all kernel objects. This list is passed to `gperf`, which generates a perfect hash function and table of those addresses, then that output is optimized by `process_gperf.py`, using known properties of our special case.

Then, the link from the previous stage is repeated, this time with the missing pieces populated.

**Post processing** Finally, if necessary, the completed kernel is converted from *ELF* to the format expected by the loader and/or flash tool required by the target. This is accomplished in a straightforward manner with *objdump*.

### 5.1.2 Supporting Scripts and Tools

The following is a detailed description of the scripts used during the build process.

#### `scripts/gen_syscalls.py`

Script to generate system call invocation macros

This script parses the system call metadata JSON file emitted by `parse_syscalls.py` to create several files:

- A file containing weak aliases of any potentially unimplemented system calls, as well as the system call dispatch table, which maps system call type IDs to their handler functions.
- A header file defining the system call type IDs, as well as function prototypes for all system call handler functions.
- A directory containing header files. Each header corresponds to a header that was identified as containing system call declarations. These generated headers contain the inline invocation functions for each system call in that header.

#### `scripts/gen_handles.py`

Translate generic handles into ones optimized for the application.

Immutable device data includes information about dependencies, e.g. that a particular sensor is controlled through a specific I2C bus and that it signals event on a pin on a specific GPIO controller. This information is encoded in the first-pass binary using identifiers derived from the devicetree. This script extracts those identifiers and replaces them with ones optimized for use with the devices actually present.

For example the sensor might have a first-pass handle defined by its devicetree ordinal 52, with the I2C driver having ordinal 24 and the GPIO controller ordinal 14. The runtime ordinal is the index of the corresponding device in the static devicetree array, which might be 6, 5, and 3, respectively.

The output is a C source file that provides alternative definitions for the array contents referenced from the immutable device objects. In the final link these definitions supersede the ones in the driver-specific object file.

#### `scripts/gen_kobject_list.py`

Script to generate gperf tables of kernel object metadata

User mode threads making system calls reference kernel objects by memory address, as the kernel/driver APIs in Zephyr are the same for both user and supervisor contexts. It is necessary for the kernel to be able to validate accesses to kernel objects to make the following assertions:

- That the memory address points to a kernel object
- The kernel object is of the expected type for the API being invoked
- The kernel object is of the expected initialization state
- The calling thread has sufficient permissions on the object

For more details see the [Kernel Objects](#) section in the documentation.

The zephyr build generates an intermediate ELF binary, `zephyr_prebuilt.elf`, which this script scans looking for kernel objects by examining the DWARF debug information to look for instances of data structures that are considered kernel objects. For device drivers, the API struct pointer populated at build time is also examined to disambiguate between various device driver instances since they are all 'struct device'.

This script can generate five different output files:

- A gperf script to generate the hash table mapping kernel object memory addresses to kernel object metadata, used to track permissions, object type, initialization state, and any object-specific data.
- A header file containing generated macros for validating driver instances inside the system call handlers for the driver subsystem APIs.
- A code fragment included by kernel.h with one enum constant for each kernel object type and each driver instance.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping the kernel object types and driver instances to their human-readable representation in the otype\_to\_str() function.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping kernel object types to their sizes. This is used for allocating instances of them at runtime (CONFIG\_DYNAMIC\_OBJECTS) in the obj\_size\_get() function.

### `scripts/gen_offset_header.py`

This script scans a specified object file and generates a header file that defined macros for the offsets of various found structure members (particularly symbols ending with `_OFFSET` or `_SIZEOF`), primarily intended for use in assembly code.

### `scripts/parse_syscalls.py`

Script to scan Zephyr include directories and emit system call and subsystem metadata

System calls require a great deal of boilerplate code in order to implement completely. This script is the first step in the build system's process of auto-generating this code by doing a text scan of directories containing C or header files, and building up a database of system calls and their function call prototypes. This information is emitted to a generated JSON file for further processing.

This script also scans for struct definitions such as `__subsystem` and `__net_socket`, emitting a JSON dictionary mapping tags to all the struct declarations found that were tagged with them.

If the output JSON file already exists, its contents are checked against what information this script would have outputted; if the result is that the file would be unchanged, it is not modified to prevent unnecessary incremental builds.

### `arch/x86/gen_idt.py`

Generate Interrupt Descriptor Table for x86 CPUs.

This script generates the interrupt descriptor table (IDT) for x86. Please consult the IA Architecture SW Developer Manual, volume 3, for more details on this data structure.

This script accepts as input the `zephyr_prebuilt.elf` binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the IDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols. From the kernel binary we read a special section "intList" which contains the desired interrupt routing configuration for the kernel, populated by instances of the `IRQ_CONNECT()` macro.

This script outputs three binary tables:

1. The interrupt descriptor table itself.
2. A bitfield indicating which vectors in the IDT are free for installation of dynamic interrupts at runtime.
3. An array which maps configured IRQ lines to their associated vector entries in the IDT, used to program the APIC at runtime.

### arch/x86/gen\_gdt.py

Generate a Global Descriptor Table (GDT) for x86 CPUs.

For additional detail on GDT and x86 memory management, please consult the IA Architecture SW Developer Manual, vol. 3.

This script accepts as input the `zephyr_prebuilt.elf` binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the GDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols.

The input kernel ELF binary is used to obtain the following information:

- Memory addresses of the Main and Double Fault TSS structures so GDT descriptors can be created for them
- Memory addresses of where the GDT lives in memory, so that this address can be populated in the GDT pseudo descriptor
- whether userspace or HW stack protection are enabled in Kconfig

The output is a GDT whose contents depend on the kernel configuration. With no memory protection features enabled, we generate flat 32-bit code and data segments. If hardware- based stack overflow protection or userspace is enabled, we additionally create descriptors for the main and double- fault IA tasks, needed for userspace privilege elevation and double-fault handling. If userspace is enabled, we also create flat code/data segments for ring 3 execution.

### scripts/gen\_relocate\_app.py

This script will relocate `.text`, `.rodata`, `.data` and `.bss` sections from required files and places it in the required memory region. This memory region and file are given to this python script in the form of a string.

Example of such a string would be:

```
SRAM2:/home/xyz/zephyr/samples/hello_world/src/main.c,\nSRAM1:/home/xyz/zephyr/samples/hello_world/src/main2.c
```

To invoke this script:

```
python3 gen_relocate_app.py -i input_string -o generated_linker -c generated_code
```

Configuration that needs to be sent to the python script.

- If the memory is like SRAM1/SRAM2/CCD/AON then place full object in the sections
- If the memory type is appended with `_DATA` / `_TEXT` / `_RODATA` / `_BSS` only the selected memory is placed in the required memory region. Others are ignored.

Multiple regions can be appended together like `SRAM2_DATA_BSS` this will place data and bss inside SRAM2.

### scripts/process\_gperf.py

gperf C file post-processor

We use gperf to build up a perfect hashtable of pointer values. The way gperf does this is to create a table 'wordlist' indexed by a string representation of a pointer address, and then doing `memcmp()` on a string passed in for comparison

We are exclusively working with 4-byte pointer values. This script adjusts the generated code so that we work with pointers directly and not strings. This saves a considerable amount of space.

### scripts/gen\_app\_partitions.py

Script to generate a linker script organizing application memory partitions

Applications may declare build-time memory domain partitions with `K_APPMEM_PARTITION_DEFINE`, and assign globals to them using `K_APP_DMEM` or `K_APP_BMEM` macros. For each of these partitions, we need to route all their data into appropriately-sized memory areas which meet the size/alignment constraints of the memory protection hardware.

This linker script is created very early in the build process, before the build attempts to link the kernel binary, as the linker script this tool generates is a necessary pre-condition for kernel linking. We extract the set of memory partitions to generate by looking for variables which have been assigned to input sections that follow a defined naming convention. We also allow entire libraries to be pulled in to assign their globals to a particular memory partition via command line directives.

This script takes as inputs:

- The base directory to look for compiled objects
- key/value pairs mapping static library files to what partitions their globals should end up in.

The output is a linker script fragment containing the definition of the app shared memory section, which is further divided, for each partition found, into data and BSS for each partition.

## 5.2 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called *symbols*) are defined in Kconfig files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.

The output from Kconfig is a header file `autoconf.h` with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing Kconfig files.

### 5.2.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: `menuconfig` and `guiconfig`. `menuconfig` is a curses-based interface that runs in the terminal, while `guiconfig` is a graphical configuration interface.

---

**Note:** The configuration can also be changed by editing `zephyr/.config` in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in `zephyr/.config`, the assignment will be ignored and overwritten when re-configuring.

---

To make a setting permanent, you should set it in a `*.conf` file, as described in [Setting Kconfig configuration values](#).

---

**Tip:** Saving a minimal configuration file (with e.g. `D` in `menuconfig`) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their

default value.

---

To run one of the configuration interfaces, do this:

1. Build your application as usual using either west or cmake:

Using west:

```
west build -b <board>
```

Using CMake and ninja:

```
mkdir build && cd build
cmake -GNinja -DBOARD=<board> ..
ninja
```

2. To run the terminal-based menuconfig interface, use either of these commands:

```
west build -t menuconfig
```

```
ninja menuconfig
```

To run the graphical guiconfig, use either of these commands:

```
west build -t guiconfig
```

```
ninja guiconfig
```

---

**Note:** If you get an import error for tkinter when trying to run guiconfig, you are missing required packages. See [Install Linux Host Dependencies](#). The package you need is usually called something like python3-tk/python3-tkinter.

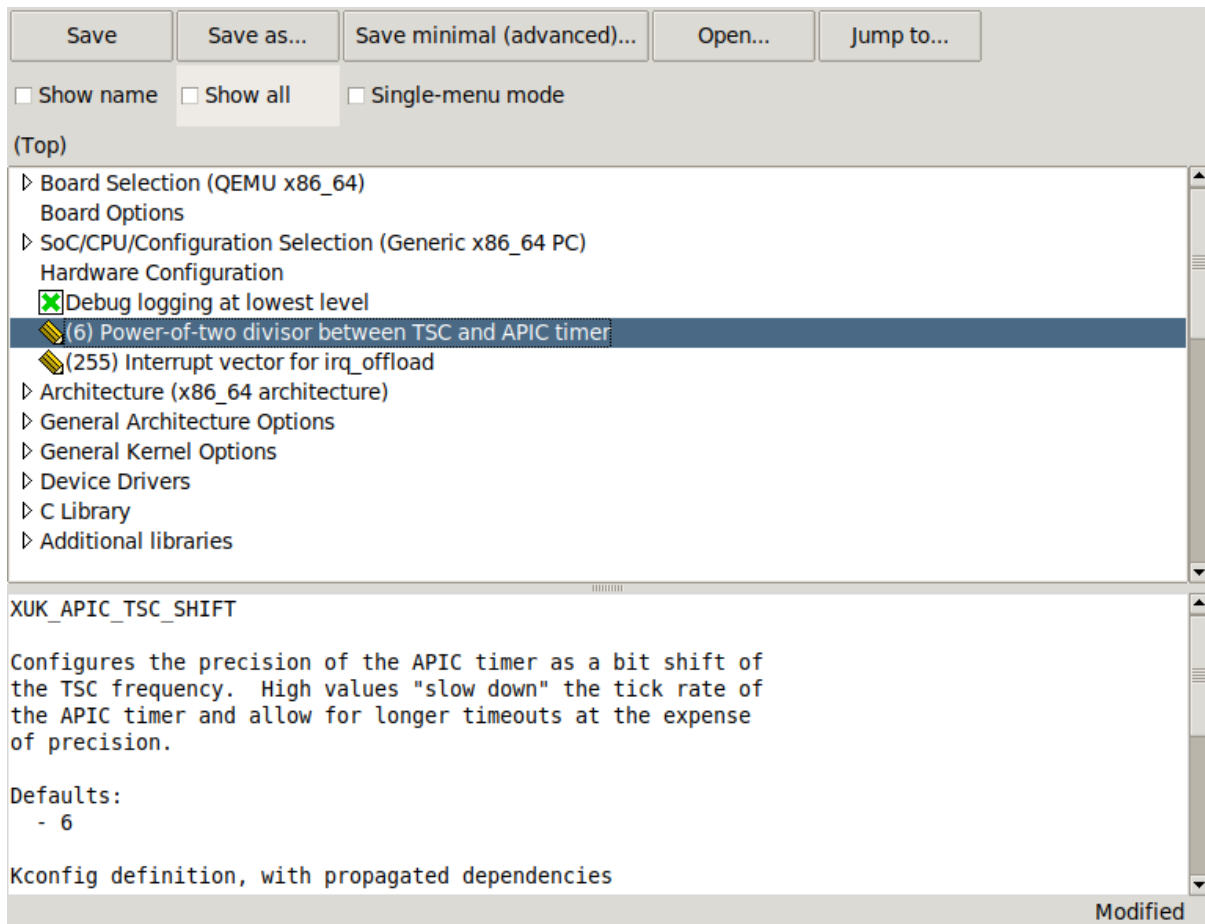

tkinter is not included by default in many Python installations, despite being part of the standard library.

---

The two interfaces are shown below:

The screenshot shows a terminal window with a menuconfig interface. The title bar includes 'File', 'Edit', 'View', 'Search', 'Terminal', and 'Help'. The main window has a yellow header bar that says '(Top)' and 'Zephyr Kernel Configuration'. Below this, a list of configuration options is shown, with 'Board Selection (QEMU x86\_64)' highlighted in blue. The options include 'Board Options', 'SoC/CPU/Configuration Selection (Generic x86\_64 PC)', 'Hardware Configuration', 'Debug logging at lowest level', 'Power-of-two divisor between TSC and APIC timer', 'Interrupt vector for irq\_offload', 'Architecture (x86\_64 architecture)', 'General Architecture Options', 'General Kernel Options', 'Device Drivers', 'C Library', 'Additional libraries', 'Bluetooth', and 'Console'. At the bottom, a yellow bar contains a list of keyboard shortcuts: '[Space/Enter] Toggle/enter', '[ESC] Leave menu', '[S] Save', '[O] Load', '[?] Symbol info', '[/] Jump to symbol', '[F] Toggle show-help mode', '[C] Toggle show-name mode', '[A] Toggle show-all mode', and '[Q] Quit (prompts for save)', '[D] Save minimal config (advanced)'.

guiconfig always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press `?` to view the same information.

**Note:** If you prefer to work in the `guiconfig` interface, then it's a good idea to check any changes to Kconfig files you make in *single-menu mode*, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

### 3. Change configuration values in the `menuconfig` interface as follows:

- Navigate the menu with the arrow keys. Common Vim key bindings are supported as well.
- Use Space and Enter to enter menus and toggle values. Menus appear with `--->` next to them. Press ESC to return to the parent menu.

Boolean configuration options are shown with `[ ]` brackets, while numeric and string-valued configuration symbols are shown with `( )` brackets. Symbol values that can't be changed are shown as `-` or `-*`.

**Note:** You can also press Y or N to set a boolean configuration symbol to the corresponding value.

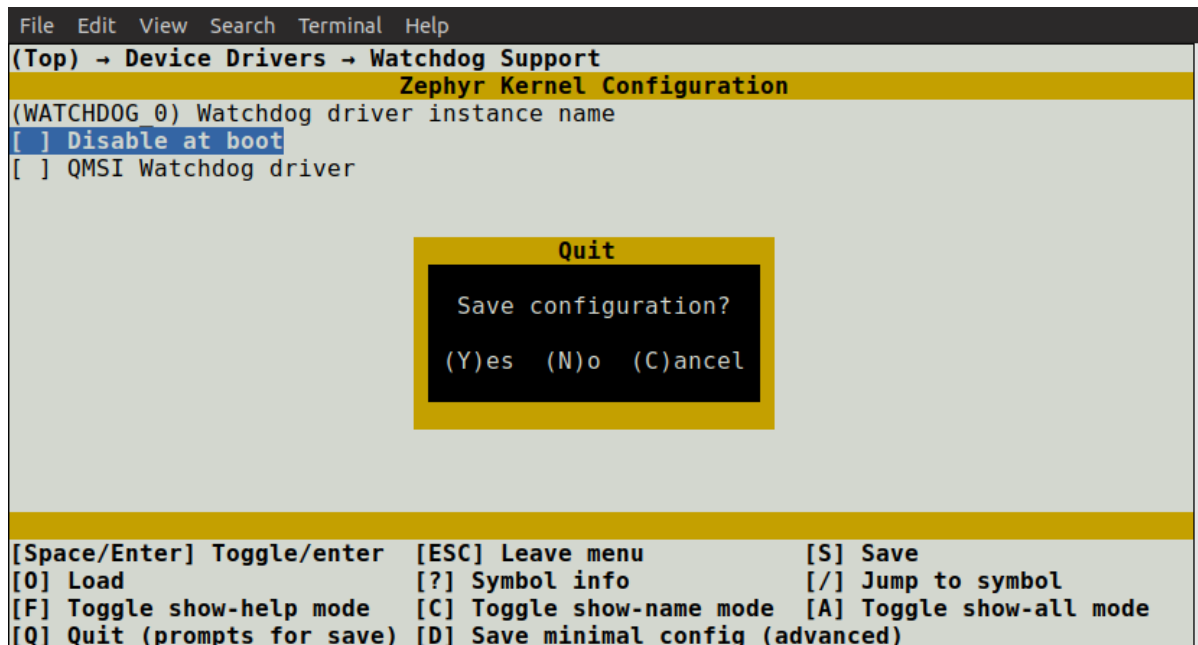

- Press `?` to display information about the currently selected symbol, including its help text. Press ESC or Q to return from the information display to the menu.

In the `guiconfig` interface, either click on the image next to the symbol to change its value, or

double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).

guiconfig also supports keyboard controls, which are similar to menuconfig.

- Pressing Q in the menuconfig interface will bring up the save-and-quit dialog (if there are changes to save):

Press Y to save the kernel configuration options to the default filename (zephyr/.config). You will typically save to the default filename unless you are experimenting with different configurations.

The guiconfig interface will also prompt for saving the configuration on exit if it has been modified.

**Note:** The configuration file used during the build is always zephyr/.config. If you have another saved configuration that you want to build with, copy it to zephyr/.config. Make sure to back up your original configuration file.

Also note that filenames starting with . are not listed by ls by default on Linux and macOS. Use the -a flag to see them.

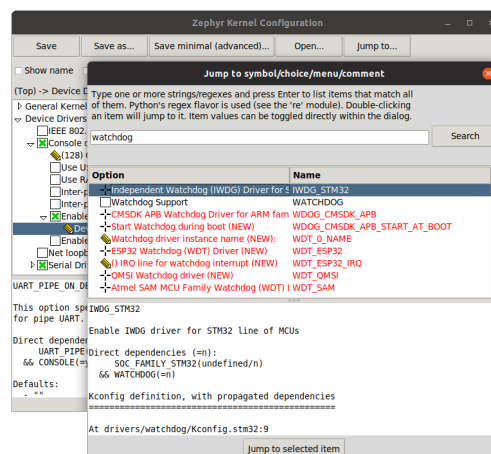

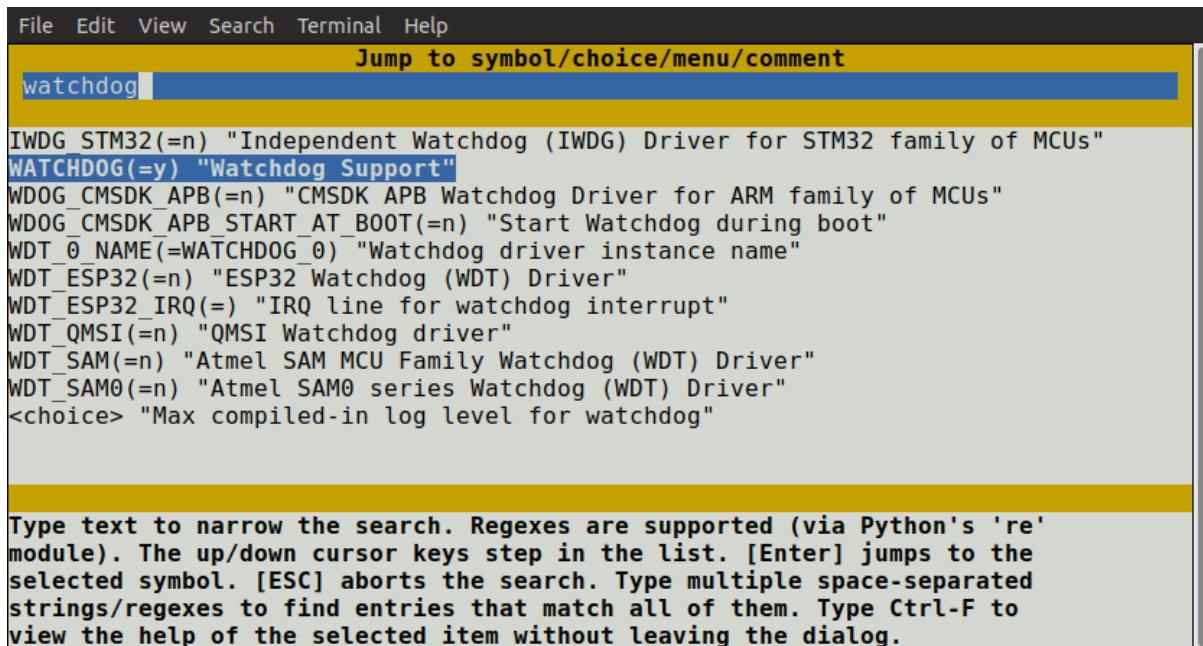

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the / key (this also works in guiconfig). This brings up the following dialog, where you can search for symbols by name and jump to them. In guiconfig, you can also change symbol values directly within the dialog.

If you jump to a symbol that isn't currently visible (e.g., due to having unsatisfied dependencies), then *show-all mode* will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press A in menuconfig or Ctrl-A in guiconfig.

**Note:** Show-all mode can't be turned off if there are no visible items in the current menu.

To figure out why a symbol you jumped to isn't visible, inspect its dependencies, either by pressing ? in menuconfig or in the information pane at the bottom in guiconfig. If you discover that the symbol depends on another symbol that isn't enabled, you can jump to that symbol in turn to see if it can be enabled.

**Note:** In `menuconfig`, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

---

For more information on `menuconfig` and `guiconfig`, see the Python docstrings at the top of [menuconfig.py](#) and [guiconfig.py](#).

### 5.2.2 Setting Kconfig configuration values

The [menuconfig and guiconfig interfaces](#) can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

---

**Note:** Before making changes to Kconfig files, it's a good idea to also go through the [Kconfig - Tips and Best Practices](#) page.

---

#### Visible and invisible Kconfig symbols

When making Kconfig changes, it's important to understand the difference between *visible* and *invisible* symbols.

- A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence *visible*), and can be set in configuration files.

Here's an example of a visible symbol:

```
config FPU
    bool "Support floating point operations"
    depends on HAS_FPU
```

The symbol is shown like this in `menuconfig`, where it can be toggled:

```
[ ] Support floating point operations
```

- An *invisible* symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

Here's an example of an invisible symbol:

```
config CPU_HAS_FPU
    bool
    help
        This symbol is y if the CPU has a hardware floating point unit.
```

In this case, `CPU_HAS_FPU` is enabled through other symbols having `select CPU_HAS_FPU`.

#### Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a `*_defconfig` file for the board with application settings, usually from `prj.conf`. See [The Initial Configuration](#) below for more details.

Assignments in configuration files use this syntax:

```
CONFIG_<symbol name>=<value>
```

There should be no spaces around the equals sign.

bool symbols can be enabled or disabled by setting them to y or n, respectively. The FPU symbol from the example above could be enabled like this:

```
CONFIG_FPU=y
```

**Note:** A boolean symbol can also be set to n with a comment formatted like this:

```
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in `zephyr/.config`.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn't use this). Having n-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```
CONFIG_SOME_STRING="cool value"
CONFIG_SOME_INT=123
```

Comments use a #:

```
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the [interactive configuration interfaces](#) (you can jump directly to a symbol with /), or look up the symbol in the Kconfig search page.

## The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:

1. A BOARD-specific configuration file stored in `boards/<architecture>/<BOARD>/<BOARD>_defconfig`
2. Any CMake cache entries prefix with `CONFIG_`
3. The application configuration

The application configuration can come from the sources below. By default, `prj.conf` is used.

1. If `CONF_FILE` is set, the configuration file(s) specified in it are merged and used as the application configuration. `CONF_FILE` can be set in various ways:
  1. In `CMakeLists.txt`, before calling `find_package(Zephyr)`
  2. By passing `-DCONF_FILE=<conf file(s)>`, either directly or via `west`
  3. From the CMake variable cache
2. Otherwise if `CONF_FILE` is set, and a single configuration file of the form `prj_<build>.conf` is used, then if file `boards/<BOARD>_<build>.conf` exists in same folder as file `prj_<build>.conf`, the result of merging `prj_<build>.conf` and `boards/<BOARD>_<build>.conf` is used.
3. Otherwise, `prj_<BOARD>.conf` is used if it exists in the application directory.
4. Otherwise, if `boards/<BOARD>.conf` exists in the application directory, the result of merging it with `prj.conf` is used.

5. Otherwise, if board revisions are used and `boards/<BOARD>_<revision>.conf` exists in the application directory, the result of merging it with `prj.conf` and `boards/<BOARD>.conf` is used.
6. Otherwise, `prj.conf` is used if it exists in the application directory

If a symbol is assigned both in `<BOARD>.defconfig` and in the application configuration, the value set in the application configuration takes precedence.

The merged configuration is saved to `zephyr/.config` in the build directory.

As long as `zephyr/.config` exists and is up-to-date (is newer than any BOARD and application configuration files), it will be used in preference to producing a new merged configuration. `zephyr/.config` is also the configuration that gets modified when making changes in the [interactive configuration interfaces](#).

## Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible symbols. This is done in `boards/<architecture>/<BOARD>/Kconfig.defconfig`, which is a regular Kconfig file.

---

**Note:** Assignments in `.config` files have no effect on invisible symbols, so this scheme is not just an organizational issue.

---

Assigning values in `Kconfig.defconfig` relies on defining a Kconfig symbol in multiple locations. As an example, say we want to set `FOO_WIDTH` below to 32:

```
config FOO_WIDTH
    int
```

To do this, we extend the definition of `FOO_WIDTH` as follows, in `Kconfig.defconfig`:

```
if BOARD_MY_BOARD

config FOO_WIDTH
    default 32

endif
```

---

**Note:** Since the type of the symbol (`int`) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the “base” definition of the symbol is a good idea for reasons explained in [Common Kconfig shorthands](#).

---

default values in `Kconfig.defconfig` files have priority over default values given on the “base” definition of a symbol. Internally, this is implemented by including the `Kconfig.defconfig` files first. Kconfig uses the first default with a satisfied condition, where an empty condition corresponds to `if y` (is always satisfied).

Note that conditions from surrounding top-level `ifs` are propagated to symbol properties, so the above default is equivalent to `default 32 if BOARD_MY_BOARD`.

**Warning:** When defining a symbol in multiple locations, dependencies are ORed together rather than ANDed together. It is not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the direct dependencies of the symbol below becomes `DEP1 || DEP2`:

```
config F00
...
depends on DEP1

config F00
...
depends on DEP2
```

When making changes to `Kconfig.defconfig` files, always check the symbol's direct dependencies in one of the *interactive configuration interfaces* afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol's dependencies.

**Motivation for `Kconfig.defconfig` files** One motivation for this configuration scheme is to avoid making fixed BOARD-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via `<BOARD>_defconfig`, all symbols would have to be visible, as values given in `<BOARD>_defconfig` have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via *devicetree* instead.

**Configuring choices** There are two ways to configure a Kconfig choice:

1. By setting one of the choice symbols to `y` in a configuration file.

Setting one choice symbol to `y` automatically gives all other choice symbols the value `n`.

If multiple choice symbols are set to `y`, only the last one set to `y` will be honored (the rest will get the value `n`). This allows a choice selection from a board `defconfig` file to be overridden from an application `prj.conf` file.

2. By changing the default of the choice in `Kconfig.defconfig`.

As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

As an example, assume that a choice has the following base definition (here, the name of the choice is `F00`):

```
choice F00
    bool "Foo choice"
    default B

config A
    bool "A"

config B
    bool "B"

endchoice
```

To change the default symbol of `F00` to `A`, you would add the following definition to `Kconfig.defconfig`:

```
choice F00
    default A
endchoice
```

The `Kconfig.defconfig` method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

**More Kconfig resources** The [Kconfig - Tips and Best Practices](#) page has some tips for writing Kconfig files.

The `kconfiglib.py` docstring docstring (at the top of the file) goes over how symbol values are calculated in detail.

### 5.2.3 Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

## What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don't.

If a symbol has a prompt (e.g. `bool "Enable foo"`), then the user can change the symbol's value in the `menuconfig` or `guiconfig` interface (see [Interactive Kconfig interfaces](#)), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called *hidden* or *invisible* symbols, because they don't show up in `menuconfig` and `guiconfig`. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can't be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the [optional prompts](#) section for a way to deal with settings that are fixed on some machines and configurable on other machines.

## What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via [devicetree](#) instead.

In particular, avoid adding new Kconfig options of the following types:

**Options enabling individual devices** Existing examples like `:kconfig: `CONFIG_I2C_0`` and `:kconfig: `CONFIG_I2C_1`` were introduced before Zephyr supported devicetree, and new cases are discouraged. See [Write device drivers using devicetree APIs](#) for details on how to do this with devicetree instead.

**Options that specify a device in the system by name** For example, if you are writing an I2C device driver, avoid creating an option named `MY_DEVICE_I2C_BUS_NAME` for specifying the bus node your device is controlled by. See [Device drivers that depend on other devices](#) for alternatives.

Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like `MY_PWM_DEVICE_NAME`. See [Applications that depend on board-specific devices](#) for alternatives.

**Options that specify fixed hardware configuration** For example, avoid Kconfig options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type `phandle-array` in the device binding, and using the [GPIO](#) devicetree API from C. Similar advice applies to other cases where

devicetree.h provides *Hardware specific APIs* for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree *binding* to identify board specific properties may be appropriate. See [tests/drivers/gpio/gpio\\_basic\\_api](#) for an example.

For applications, see blinky-sample for a devicetree-based alternative.

### select statements

The `select` statement is used to force one symbol to `y` whenever another symbol is `y`. For example, the following code forces `CONSOLE` to `y` whenever `USB_CONSOLE` is `y`:

```
config CONSOLE
    bool "Console support"

...

config USB_CONSOLE
    bool "USB console support"
    select CONSOLE
```

This section covers some pitfalls and good uses for `select`.

**select pitfalls** `select` might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the `CONSOLE` symbol above, by a developer who is unaware of the `USB_CONSOLE` symbol (or simply forgot about it):

```
config CONSOLE
    bool "Console support"
    depends on STRING_ROUTINES
```

Enabling `USB_CONSOLE` now forces `CONSOLE` to `y`, even if `STRING_ROUTINES` is `n`.

To fix the problem, the `STRING_ROUTINES` dependency needs to be added to `USB_CONSOLE` as well:

```
config USB_CONSOLE
    bool "USB console support"
    select CONSOLE
    depends on STRING_ROUTINES

...

config STRING_ROUTINES
    bool "Include string routines"
```

More insidious cases with dependencies inherited from `if` and `menu` statements are common.

An alternative attempt to solve the issue might be to turn the `depends on` into another `select`:

```
config CONSOLE
    bool "Console support"
    select STRING_ROUTINES

...

config USB_CONSOLE
```

(continues on next page)

(continued from previous page)

```
bool "USB console support"
select CONSOLE
```

In practice, this often amplifies the problem, because any dependencies added to `STRING_ROUTINES` now need to be copied to both `CONSOLE` and `USB_CONSOLE`.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.

Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in [Using select for helper symbols](#).

Liberal use of `select` also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of `select`, which hides ways in which a symbol might get enabled.

**Alternatives to `select`** For the example in the previous section, a better solution is usually to turn the `select` into a `depends on`:

```
config CONSOLE
    bool "Console support"
    ...

config USB_CONSOLE
    bool "USB console support"
    depends on CONSOLE
```

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using `depends on` here might be that configuration files that enable `USB_CONSOLE` now also need to enable `CONSOLE`:

```
CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y
```

This comes down to a trade-off, but if enabling `CONSOLE` is the norm, then a mitigation is to make `CONSOLE` default to `y`:

```
config CONSOLE
    bool "Console support"
    default y
```

This gives just a single assignment in configuration files:

```
CONFIG_USB_CONSOLE=y
```

Note that configuration files that do not want `CONSOLE` enabled now have to explicitly disable it:

```
CONFIG_CONSOLE=n
```

**Using `select` for helper symbols** A good and safe use of `select` is for setting “helper” symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

```
config CPU_HAS_FPU
    bool
    help
        If y, the CPU has an FPU
    ...

config SOC_FOO
    bool "FOO SoC"
    select CPU_HAS_FPU
    ...

config SOC_BAR
    bool "BAR SoC"
    select CPU_HAS_FPU
```

This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

```
config FPU
    bool "Support floating point operations"
    depends on CPU_HAS_FPU
```

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

```
config FPU
    bool "Support floating point operations"
    depends on SOC_FOO || SOC_BAR || ...
```

Invisible helper symbols can also be useful without `select`. For example, the following code defines a helper symbol that has the value `y` if the machine has some arbitrarily-defined “large” amount of memory:

```
config LARGE_MEM
    def_bool MEM_SIZE >= 64
```

---

**Note:** This is short for the following:

```
config LARGE_MEM
    bool
    default MEM_SIZE >= 64
```

---

**select recommendations** In summary, here are some recommended practices for `select`:

- Avoid selecting symbols with prompts or dependencies. Prefer `depends on`. If `depends on` causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

Rare exceptions might include cases where you’re sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same `if`.

Common sense applies, but be aware that `select` often causes issues in practice. `depends on` is usually a cleaner and safer solution.

- Select simple helper symbols without prompts and dependencies however much you like. They’re a great tool for simplifying Kconfig files.

### (Lack of) conditional includes

`if` blocks add dependencies to each item within the `if`, as `if depends on` was used.

A common misunderstanding related to `if` is to think that the following code conditionally includes the file `Kconfig.other`:

```
if DEP
source "Kconfig.other"
endif
```

In reality, there are no conditional includes in `Kconfig`. `if` has no special meaning around a `source`.

---

**Note:** Conditional includes would be impossible to implement, because `if` conditions may contain (either directly or indirectly) forward references to symbols that haven't been defined yet.

---

Say that `Kconfig.other` above contains this definition:

```
config F00
    bool "Support foo"
```

In this case, `F00` will end up with this definition:

```
config F00
    bool "Support foo"
    depends on DEP
```

Note that it is redundant to add `depends on DEP` to the definition of `F00` in `Kconfig.other`, because the `DEP` dependency has already been added by `if DEP`.

In general, try to avoid adding redundant dependencies. They can make the structure of the `Kconfig` files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

### “Stuck” symbols in `menuconfig` and `guiconfig`

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:

```
config F00
    bool "Foo"

config STACK_SIZE
    hex "Stack size"
    default 0x200 if F00
    default 0x100
```

Assume that the intention here is to use a larger stack whenever `F00` is enabled, and that the configuration initially has `F00` disabled. Also, remember that Zephyr creates an initial configuration in `zephyr/.config` in the build directory by merging configuration files (including e.g. `prj.conf`). This configuration file exists before `menuconfig` or `guiconfig` is run.

When first entering the configuration interface, the value of `STACK_SIZE` is `0x100`, as expected. After enabling `F00`, you might reasonably expect the value of `STACK_SIZE` to change to `0x200`, but it stays as `0x100`.

To understand what's going on, remember that `STACK_SIZE` has a prompt, meaning it is user-configurable, and consider that all `Kconfig` has to go on from the initial configuration is this:

```
CONFIG_STACK_SIZE=0x100
```

Since Kconfig can't know if the 0x100 value came from a default or was typed in by the user, it has to assume that it came from the user. Since `STACK_SIZE` is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of `STACK_SIZE` appears to be “frozen” at 0x100 when toggling `F00`.

The right fix depends on what the intention is. Here's some different scenarios with suggestions:

- If `STACK_SIZE` can always be derived automatically and does not need to be user-configurable, then just remove the prompt:

```
config STACK_SIZE
    hex
    default 0x200 if F00
    default 0x100
```

Symbols without prompts ignore any value from the saved configuration.

- If `STACK_SIZE` should usually be user-configurable, but needs to be set to 0x200 when `F00` is enabled, then disable its prompt when `F00` is enabled, as described in [optional prompts](#):

```
config STACK_SIZE
    hex "Stack size" if !F00
    default 0x200 if F00
    default 0x100
```

- If `STACK_SIZE` should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making `STACK_SIZE` user-configurable:

```
config CUSTOM_STACK_SIZE
    bool "Use a custom stack size"
    help
        Enable this if you need to use a custom stack size. When disabled, a
        suitable stack size is calculated automatically.

config STACK_SIZE
    hex "Stack size" if CUSTOM_STACK_SIZE
    default 0x200 if F00
    default 0x100
```

As long as `CUSTOM_STACK_SIZE` is disabled, `STACK_SIZE` will ignore the value from the saved configuration.

It is a good idea to try out changes in the `menuconfig` or `guiconfig` interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.

### Assignments to promptless symbols in configuration files

Assignments to hidden (promptless, also called *invisible*) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. `default` and `select`.

A common source of confusion is opening the output configuration file (`zephyr/.config`), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in `zephyr/.config` are ignored by Kconfig, like for other configuration files.

To understand why `zephyr/.config` still includes assignments to hidden symbols, it helps to realize that `zephyr/.config` serves two separate purposes:

1. It holds the saved configuration, and

2. it holds configuration output. `zephyr/.config` is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in `zephyr/.config` are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

---

**Note:** A *minimal configuration*, which can be generated from within the [menuconfig](#) and [guiconfig](#) interfaces, could be considered closer to just a saved configuration, without the full configuration output.

---

#### depends on and string/int/hex symbols

`depends on` works not just for bool symbols, but also for string, int, and hex symbols (and for choices).

The Kconfig definitions below will hide the `FOO_DEVICE_FREQUENCY` symbol and disable any configuration output for it when `FOO_DEVICE` is disabled.

```
config FOO_DEVICE
    bool "Foo device"

config FOO_DEVICE_FREQUENCY
    int "Foo device frequency"
    depends on FOO_DEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the menuconfig/guiconfig interface. Having `FOO_DEVICE_FREQUENCY` show up when `FOO_DEVICE` is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at `FOO_DEVICE_FREQUENCY` when `FOO_DEVICE` is disabled.

#### menuconfig symbols

If the definition of a symbol `F00` is immediately followed by other symbols that depend on `F00`, then those symbols become children of `F00`. If `F00` is defined with `config F00`, then the children are shown indented relative to `F00`. Defining `F00` with `menuconfig F00` instead puts the children in a separate menu rooted at `F00`.

menuconfig has no effect on evaluation. It's just a display option.

menuconfig can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```
menu "Foo subsystem"

config FOO_SUBSYSTEM
    bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"
```

(continues on next page)

(continued from previous page)

```
... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM

endmenu
```

In this case, it's probably better to get rid of the menu and turn FOO\_SUBSYSTEM into a menuconfig symbol:

```
menuconfig FOO_SUBSYSTEM
    bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM
```

In the menuconfig interface, this will be displayed as follows:

```
[*] Foo subsystem --->
```

Note that making a symbol without children a menuconfig is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

```
[*] I have no children ----
[*] All my children are invisible ----
```

## Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in [menuconfig](#) or [guiconfig](#) afterwards. To get to a symbol quickly, use the jump-to feature (press /).

Here are some things to check:

- Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.

If one symbol depends on another, then it's often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the menuconfig interface, and in a separate menu rooted at the symbol in guiconfig. This also works if several symbols are placed after the symbol they depend on.

- Is it easy to guess what the symbols do from their prompts?
- If many symbols are added, do all combinations of values they can be set to make sense?

For example, if two symbols FOO\_SUPPORT and NO\_FOO\_SUPPORT are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it's probably better to have a single FOO\_SUPPORT symbol.

- Are there any duplicated dependencies?

This can be checked by selecting a symbol and pressing ? to view the symbol information. If there are duplicated dependencies, then use the Included via ... path shown in the symbol information to figure out where they come from.

### Checking changes with `scripts/kconfig/lint.py`

After you make Kconfig changes, you can use the `scripts/kconfig/lint.py` script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use `--help` to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there's a problem. If a check returns a false positive e.g. due to token pasting in C (`CONFIG_FOO_##index##_BAR`), just ignore it.

When investigating an unknown symbol `FOO_BAR`, it is a good idea to run `git grep FOO_BAR` to look for references. It is also a good idea to search for some components of the symbol name with e.g. `git grep FOO` and `git grep BAR`, as it can help uncover token pasting.

### Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.

**Factoring out common dependencies** If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an `if`.

As an example, consider the following code:

```
config FOO
    bool "Foo"
    depends on DEP

config BAR
    bool "Bar"
    depends on DEP

choice
    prompt "Choice"
    depends on DEP

config BAZ
    bool "Baz"

config QAZ
    bool "Qaz"

endchoice
```

Here, the `DEP` dependency can be factored out like this:

```
if DEP

config FOO
    bool "Foo"

config BAR
```

(continues on next page)

(continued from previous page)

```
    bool "Bar"

choice
    prompt "Choice"

config BAZ
    bool "Baz"

config QAZ
    bool "Qaz"

endchoice

endif # DEP
```

---

**Note:** Internally, the second version of the code is transformed into the first.

---

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

```
menu "Foo features"
    depends on FOO_SUPPORT

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

endmenu
```

If `FOO_SUPPORT` is `n`, the entire menu disappears.

**Redundant defaults** `bool` symbols implicitly default to `n`, and `string` symbols implicitly default to the empty string. Therefore, `default n` and `default ""` are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for `bool` and `string` symbols. That also generates clearer documentation: (*Implicitly defaults to n instead of n if <dependencies, possibly inherited>*).

---

**Note:** The one case where `default n/default ""` is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a `default y` on a later definition.

---

Defaults *should* always be given for `int` and `hex` symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit `0` default might be less likely to be what was intended compared to other symbol types as well.

**Common Kconfig shorthands** Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```
config FOO
    bool "foo"
```

```
config F00
    bool
    prompt "foo"
```

The first style, with the shorthand, is preferred in Zephyr.

- `def_<type> <value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```
config F00
    def_bool BAR && BAZ
```

```
config F00
    bool
    default BAR && BAZ
```

Using both the `<type>` "prompt" and the `def_<type> <value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type> <value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.

---

**Note:** For a symbol defined in multiple locations (e.g., in a `Kconfig.defconfig` file in Zephyr), it is best to only give the symbol type for the “base” definition of the symbol, and to use `default` (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

---

**Prompt strings** For a Kconfig symbol that enables a driver/subsystem FOO, consider having just “Foo” as the prompt, instead of “Enable Foo support” or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

**Header comments and other nits** A few formatting nits, to help keep things consistent:

- Use this format for any header comments at the top of Kconfig files:

```
# <Overview of symbols defined in the file, preferably in plain English>
(Blank line)
# Copyright (c) 2019 ...
# SPDX-License-Identifier: <License>
(Blank line)
(Kconfig definitions)
```

- Format comments as `# Comment` rather than `#Comment`
- Put a blank line before/after each top-level `if` and `endif`
- Use a single tab for each indentation
- Indent help text with two extra spaces

### Lesser-known/used Kconfig features

This section lists some more obscure Kconfig behaviors and features that might still come in handy.

**The `imply` statement** The `imply` statement is similar to `select`, but respects dependencies and doesn't force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:

```
config SOC_F00
    bool "FOO SoC"
    imply USB_KEYBOARD

...

config USB_KEYBOARD
    bool "USB keyboard support"
```

`imply` acts like a suggestion, whereas `select` forces a value.

**Optional prompts** A condition can be put on a symbol's prompt to make it optionally configurable by the user. For example, a value `MASK` that's hardcoded to `0xFF` on some boards and configurable on others could be expressed as follows:

```
config MASK
    hex "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

---

**Note:** This is short for the following:

```
config MASK
    hex
    prompt "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

---

The `HAS_CONFIGURABLE_MASK` helper symbol would get selected by boards to indicate that `MASK` is configurable. When `MASK` is configurable, it will also default to `0xFF`.

**Optional choices** Defining a choice with the optional keyword allows the whole choice to be toggled off to select none of the symbols:

```
choice
    prompt "Use legacy protocol"
    optional

config LEGACY_PROTOCOL_1
    bool "Legacy protocol 1"

config LEGACY_PROTOCOL_2
    bool "Legacy protocol 2"

endchoice
```

In the `menuconfig` interface, this will be displayed e.g. as `[*] Use legacy protocol (Legacy protocol 1) --->`, where the choice can be toggled off to enable neither of the symbols.

**visible if conditions** Putting a `visible if` condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

```
menu "Foo subsystem"
    depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
    int "Foo setting 1"
    default 1

config FOO_SETTING_2
    int "Foo setting 2"
    default 2

endmenu
```

When `HAS_CONFIGURABLE_FOO` is `n`, no configuration output is generated for `FOO_SETTING_1` and `FOO_SETTING_2`, as the code above is logically equivalent to the following code:

```
config FOO_SETTING_1
    int "Foo setting 1"
    default 1
    depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
    depends on HAS_CONFIGURABLE_FOO
```

If we want the symbols to still get their default values even when `HAS_CONFIGURABLE_FOO` is `n`, but not be configurable by the user, then we can use `visible if` instead:

```
menu "Foo subsystem"
    visible if HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
    int "Foo setting 1"
    default 1

config FOO_SETTING_2
    int "Foo setting 2"
    default 2

endmenu
```

This is logically equivalent to the following:

```
config FOO_SETTING_1
    int "Foo setting 1" if HAS_CONFIGURABLE_FOO
    default 1

config FOO_SETTING_2
    int "Foo setting 2" if HAS_CONFIGURABLE_FOO
    default 2
```

---

**Note:** See the [optional prompts](#) section for the meaning of the conditions on the prompts.

---

When `HAS_CONFIGURABLE` is `n`, we now get the following configuration output for the symbols, instead of no output:

```
...
CONFIG_FOO_SETTING_1=1
CONFIG_FOO_SETTING_2=2
...
```

## Other resources

The *Intro to symbol values* section in the [Kconfiglib docstring](#) goes over how symbols values are calculated in more detail.

### 5.2.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in [scripts/kconfig/kconfigfunctions.py](#).

---

**Note:** The official Kconfig preprocessor documentation can be found [here](#).

---

Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree reg property.

#### Devicetree-related Functions

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in [scripts/kconfig/kconfigfunctions.py](#) for detailed documentation.

The \*\_int version of each function returns the value as a decimal integer, while the \*\_hex version returns a hexadecimal value starting with 0x.

```
$(dt_chosen_reg_addr_int,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_addr_hex,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_size_int,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_size_hex,<property in /chosen>[,<index>,<unit>])
$(dt_node_reg_addr_int,<node path>[,<index>,<unit>])
$(dt_node_reg_addr_hex,<node path>[,<index>,<unit>])
$(dt_node_reg_size_int,<node path>[,<index>,<unit>])
$(dt_node_reg_size_hex,<node path>[,<index>,<unit>])
$(dt_compat_enabled,<compatible string>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_node_has_bool_prop,<node path>,<prop>)
$(dt_node_has_prop,<node path>,<prop>)
```

**Example Usage** Assume that the devicetree for some board looks like this:

```
{
    soc {
        #address-cells = <1>;
        #size-cells = <1>;

        spi0: spi@10014000 {
            compatible = "sifive,spi0";
            reg = <0x10014000 0x1000 0x20010000 0x3c0900>;
            reg-names = "control", "mem";
```

(continues on next page)

(continued from previous page)

```

    ...
};
};

```

The second entry in `reg` in `spi@1001400` (<0x20010000 0x3c0900>) corresponds to `mem`, and has the address 0x20010000. This address can be inserted into Kconfig as follows:

```

config FLASH_BASE_ADDRESS
    default $(dt_node_reg_addr_hex,/soc/spi@1001400,1)

```

After preprocessor expansion, this turns into the definition below:

```

config FLASH_BASE_ADDRESS
    default 0x20010000

```

### 5.2.5 Kconfig extensions

Zephyr uses the [Kconfiglib](#) implementation of [Kconfig](#), which includes some Kconfig extensions:

- Environment variables in source statements are expanded directly, meaning no “bounce” symbols with option `env="ENV_VAR"` need to be defined.

---

**Note:** option `env` has been removed from the C tools as of Linux 4.18 as well.

---

The recommended syntax for referencing environment variables is `$(FOO)` rather than `$FOO`. This uses the new [Kconfig preprocessor](#). The `$FOO` syntax for expanding environment variables is only supported for backwards compatibility.

- The source statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.

Consider the following example:

```
source "foo/bar/*/Kconfig"
```

If the pattern `foo/bar/*/Kconfig` matches the files `foo/bar/baz/Kconfig` and `foo/bar/qaz/Kconfig`, the statement above is equivalent to the following two source statements:

```
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

If no files match the pattern, an error is generated.

The wildcard patterns accepted are the same as for the Python [glob](#) module.

For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate `osource` (*optional source*) statement is available. `osource` is a no-op if no file matches.

---

**Note:** `source` and `osource` are analogous to `include` and `-include` in Make.

---

- An `rsource` statement is available for including files specified with a relative path. The path is relative to the directory of the Kconfig file that contains the `rsource` statement.

As an example, assume that `foo/Kconfig` is the top-level Kconfig file, and that `foo/bar/Kconfig` has the following statements:

```
source "qaz/Kconfig1"  
rsource "qaz/Kconfig2"
```

This will include the two files `foo/qaz/Kconfig1` and `foo/bar/qaz/Kconfig2`.

`rsource` can be used to create `Kconfig` “subtrees” that can be moved around freely.

`rsource` also supports glob patterns.

A drawback of `rsource` is that it can make it harder to figure out where a file gets included, so only use it if you need it.

- An `orsource` statement is available that combines `osource` and `rsource`.

For example, the following statement will include `Kconfig1` and `Kconfig2` from the current directory (if they exist):

```
orsource "Kconfig[12]"
```

- `def_int`, `def_hex`, and `def_string` keywords are available, analogous to `def_bool`. These set the type and add a default at the same time.

Users interested in optimizing their configuraion for security should refer to the Zephyr Security Guide’s section on the [Hardening Tool](#).

## Chapter 6

# Application Development

---

**Note:** In this document, we'll assume your **application directory** is `<home>/app`, and that its **build directory** is `<home>/app/build`. (These terms are defined in the following Overview.) On Linux/macOS, `<home>` is equivalent to `~`, whereas on Windows it's `%userprofile%`.

---

### 6.1 Overview

Zephyr's build system is based on [CMake](#).

The build system is application-centric, and requires Zephyr-based applications to initiate building the kernel source tree. The application build controls the configuration and build process of both the application and Zephyr itself, compiling them into a single binary.

Zephyr's base directory hosts Zephyr's own source code, its kernel configuration options, and its build definitions.

The files in the **application directory** link Zephyr with the application. This directory contains all application-specific files, such as configuration options and source code.

An application in its simplest form has the following contents:

```
<home>/app
├── CMakeLists.txt
├── prj.conf
└── src
    └── main.c
```

These contents are:

- **CMakeLists.txt:** This file tells the build system where to find the other application files, and links the application directory with Zephyr's CMake build system. This link provides features supported by Zephyr's build system, such as board-specific kernel configuration files, the ability to run and debug compiled binaries on real or emulated hardware, and more.
- **Kernel configuration files:** An application typically provides a Kconfig configuration file (usually called `prj.conf`) that specifies application-specific values for one or more kernel configuration options. These application settings are merged with board-specific settings to produce a kernel configuration.

See [Kconfig Configuration](#) below for more information.

- **Application source code files:** An application typically provides one or more application-specific files, written in C or assembly language. These files are usually located in a sub-directory called `src`.

Once an application has been defined, you can use CMake to create project files for building it from a directory where you want to host these files. This is known as the **build directory**. Application build artifacts are always generated in a build directory; Zephyr does not support “in-tree” builds.

The following sections describe how to create, build, and run Zephyr applications, followed by more detailed reference material.

## 6.2 Source Tree Structure

Understanding the Zephyr source tree can be helpful in locating the code associated with a particular Zephyr feature.

At the top of the tree there are several files that are of importance:

`CMakeLists.txt` The top-level file for the CMake build system, containing a lot of the logic required to build Zephyr.

`Kconfig` The top-level Kconfig file, which refers to the file `Kconfig.zephyr` also found at the top-level directory.

See [the Kconfig section of the manual](#) for detailed Kconfig documentation.

`west.yml` The [West \(Zephyr’s meta-tool\)](#) manifest, listing the external repositories managed by the west command-line tool.

The Zephyr source tree also contains the following top-level directories, each of which may have one or more additional levels of subdirectories which are not described here.

`arch` Architecture-specific kernel and system-on-chip (SoC) code. Each supported architecture (for example, x86 and ARM) has its own subdirectory, which contains additional subdirectories for the following areas:

- architecture-specific kernel source files
- architecture-specific kernel include files for private APIs

`soc` SoC related code and configuration files.

`boards` Board related code and configuration files.

`doc` Zephyr technical documentation source files and tools used to generate the <https://docs.zephyrproject.org> web content.

`drivers` Device driver code.

`dts` [devicetree](#) source files used to describe non-discoverable board-specific hardware details.

`include` Include files for all public APIs, except those defined under `lib`.

`kernel` Architecture-independent kernel code.

`lib` Library code, including the minimal standard C library.

`misc` Miscellaneous code that doesn’t belong to any of the other top-level directories.

`samples` Sample applications that demonstrate the use of Zephyr features.

`scripts` Various programs and other files used to build and test Zephyr applications.

`cmake` Additional build scripts needed to build Zephyr.

`subsys` Subsystems of Zephyr, including:

- USB device stack code.

- Networking code, including the Bluetooth stack and networking stacks.
- File system code.
- Bluetooth host and controller

`tests` Test code and benchmarks for Zephyr features.

`share` Additional architecture independent data. Currently containing Zephyr CMake package.

## 6.3 Example standalone application

A reference standalone application contained in its own Git repository can be found in the [Example Application](#) repository. It can be used as a reference on how to structure out-of-tree, Zephyr-based applications using the [T2 star topology](#). It also demonstrates the out-of-tree use of features commonly used in applications such as:

- Custom boards
- Custom devicetree bindings
- Custom drivers
- Continuous Integration (CI) setup

## 6.4 Creating an Application

Follow these steps to create a new application directory. (Refer to the [Example Application](#) repository for a reference standalone application in its own Git repository or to `samples-and-demos` for existing applications provided as part of Zephyr.)

1. Create an application directory on your workstation computer, outside of the Zephyr base directory. Usually you'll want to create it somewhere under your user's home directory.

For example, in a Unix shell or Windows `cmd.exe` prompt, navigate to where you want to create your application, then enter:

```
mkdir app
```

**Warning:** Building Zephyr or creating an application in a directory with spaces anywhere on the path is not supported. So the Windows path `C:\Users\YourName\app` will work, but `C:\Users\Your Name\app` will not.

2. It's recommended to place all application source code in a subdirectory named `src`. This makes it easier to distinguish between project files and sources.

Continuing the previous example, enter:

```
cd app
mkdir src
```

3. Place your application source code in the `src` sub-directory. For this example, we'll assume you created a file named `src/main.c`.
4. Create a file named `CMakeLists.txt` in the `app` directory with the following contents:

```
# Find Zephyr. This also loads Zephyr's build system.
cmake_minimum_required(VERSION 3.13.1)
find_package(Zephyr)
project(my_zephyr_app)

# Add your source file to the "app" target. This must come after
# find_package(Zephyr) which defines the target.
target_sources(app PRIVATE src/main.c)
```

`find_package(Zephyr)` sets the minimum CMake version and pulls in the Zephyr build system, which creates a CMake target named `app` (see [Zephyr CMake Package](#)). Adding sources to this target is how you include them in the build.

---

**Note:** `cmake_minimum_required()` is also invoked by the Zephyr package. The most recent of the two versions will be enforced by CMake.

---

5. Set Kconfig configuration options. See [Kconfig Configuration](#).
6. Configure any devicetree overlays needed by your application. See [Set devicetree overlays](#).

---

**Note:** `include($ENV{ZEPHYR_BASE}/cmake/app/boilerplate.cmake NO_POLICY_SCOPE)` is still supported for backward compatibility with older applications. Including `boilerplate.cmake` directly in the sample still requires to run `source zephyr-env.sh` or execute `zephyr-env.cmd` before building the application.

---

## 6.5 Setting Variables

### 6.5.1 Option 1: Just Once

To set the environment variable `MY_VARIABLE` to `foo` for the lifetime of your current terminal window:

```
# Linux and macOS
export MY_VARIABLE=foo

# Windows
set MY_VARIABLE=foo
```

**Warning:** This is best for experimentation. If you close your terminal window, use another terminal window or tab, restart your computer, etc., this setting will be lost forever.

Using options 2 or 3 is recommended if you want to keep using the setting.

### 6.5.2 Option 2: In all Terminals

**macOS and Linux:**

Add the `export MY_VARIABLE=foo` line to your shell's startup script in your home directory. For Bash, this is usually `~/.bashrc` on Linux or `~/.bash_profile` on macOS. Changes in these startup scripts don't affect shell instances already started; try opening a new terminal window to get the new settings.

**Windows:**

You can use the `setx` program in `cmd.exe` or the third-party RapidEE program.

To use `setx`, type this command, then close the terminal window. Any new `cmd.exe` windows will have `MY_VARIABLE` set to `foo`.

```
setx MY_VARIABLE foo
```

To install RapidEE, a freeware graphical environment variable editor, [using Chocolatey](#) in an Administrator command prompt:

```
choco install rapidee
```

You can then run `rapidee` from your terminal to launch the program and set environment variables. Make sure to use the “User” environment variables area – otherwise, you have to run RapidEE as administrator. Also make sure to save your changes by clicking the Save button at top left before exiting. Settings you make in RapidEE will be available whenever you open a new terminal window.

### 6.5.3 Option 3: Using `zephyrrc` files

Choose this option if you don’t want to make the variable’s setting available to all of your terminals, but still want to save the value for loading into your environment when you are using Zephyr.

#### macOS and Linux:

Create a file named `~/zephyrrc` if it doesn’t exist, then add this line to it:

```
export MY_VARIABLE=foo
```

To get this value back into your current terminal environment, **you must run** `source zephyr-env.sh` from the main zephyr repository. Among other things, this script sources `~/zephyrrc`.

The value will be lost if you close the window, etc.; run `source zephyr-env.sh` again to get it back.

#### Windows:

Add the line `set MY_VARIABLE=foo` to the file `%userprofile%\zephyrrc.cmd` using a text editor such as Notepad to save the value.

To get this value back into your current terminal environment, **you must run** `zephyr-env.cmd` in a `cmd.exe` window after changing directory to the main zephyr repository. Among other things, this script runs `%userprofile%\zephyrrc.cmd`.

The value will be lost if you close the window, etc.; run `zephyr-env.cmd` again to get it back.

These scripts:

- set `ZEPHYR_BASE` (see below) to the location of the zephyr repository
- adds some Zephyr-specific locations (such as zephyr’s scripts directory) to your `PATH` environment variable
- loads any settings from the `zephyrrc` files described above in [Option 3: Using `zephyrrc` files](#).

You can thus use them any time you need any of these settings.

### 6.5.4 Option 4: Using Zephyr Build Configuration CMake package

Choose this option if you want to make those variable settings shared among all users of your project.

Using a [Zephyr Build Configuration CMake package](#) allows you to commit the shared settings into the repository, so that all users can share them.

It also removes the need for running `source zephyr-env.sh` or `zephyr-env.cmd` when opening a new terminal.

## 6.6 Important Build System Variables

You can control the Zephyr build system using many variables. This section describes the most important ones that every Zephyr developer should know about.

---

**Note:** The variables `BOARD`, `CONF_FILE`, and `DTC_OVERLAY_FILE` can be supplied to the build system in 3 ways (in order of precedence):

- As a parameter to the `west build` or `cmake` invocation via the `-D` command-line switch. If you have multiple overlay files, you should use quotations, `"file1.overlay;file2.overlay"`
- As [Setting Variables](#).
- As a `set(<VARIABLE> <VALUE>)` statement in your `CMakeLists.txt`

- 
- `ZEPHYR_BASE`: Zephyr base variable used by the build system. `find_package(Zephyr)` will automatically set this as a cached CMake variable. But `ZEPHYR_BASE` can also be set as an environment variable in order to force CMake to use a specific Zephyr installation.
  - `BOARD`: Selects the board that the application's build will use for the default configuration. See boards for built-in boards, and [Board Porting Guide](#) for information on adding board support.
  - `CONF_FILE`: Indicates the name of one or more Kconfig configuration fragment files. Multiple filenames can be separated with either spaces or semicolons. Each file includes Kconfig configuration values that override the default configuration values.

See [The Initial Configuration](#) for more information.

- `OVERLAY_CONFIG`: Additional Kconfig configuration fragment files. Multiple filenames can be separated with either spaces or semicolons. This can be useful in order to leave `CONF_FILE` at its default value, but “mix in” some additional configuration options.
- `DTC_OVERLAY_FILE`: One or more devicetree overlay files to use. Multiple files can be separated with semicolons. See [Set devicetree overlays](#) for examples and [Introduction to devicetree](#) for information about devicetree and Zephyr.
- `ZEPHYR_MODULES`: A CMake list containing absolute paths of additional directories with source code, Kconfig, etc. that should be used in the application build. See [Modules \(External projects\)](#) for details.

## 6.7 Application CMakeLists.txt

Every application must have a `CMakeLists.txt` file. This file is the entry point, or top level, of the build system. The final `zephyr.elf` image contains both the application and the kernel libraries.

This section describes some of what you can do in your `CMakeLists.txt`. Make sure to follow these steps in order.

1. If you only want to build for one board, add the name of the board configuration for your application on a new line. For example:

```
set(BOARD qemu_x86)
```

Refer to boards for more information on available boards.

The Zephyr build system determines a value for `BOARD` by checking the following, in order (when a `BOARD` value is found, CMake stops looking further down the list):

- Any previously used value as determined by the CMake cache takes highest precedence. This ensures you don't try to run a build with a different `BOARD` value than you set during the build configuration step.

- Any value given on the CMake command line (directly or indirectly via `west build`) using `-DBOARD=YOUR_BOARD` will be checked for and used next.
  - If an *environment variable* `BOARD` is set, its value will then be used.
  - Finally, if you set `BOARD` in your application `CMakeLists.txt` as described in this step, this value will be used.
2. If your application uses a configuration file or files other than the usual `prj.conf` (or `prj_YOUR_BOARD.conf`, where `YOUR_BOARD` is a board name), add lines setting the `CONF_FILE` variable to these files appropriately. If multiple filenames are given, separate them by a single space or semicolon. CMake lists can be used to build up configuration fragment files in a modular way when you want to avoid setting `CONF_FILE` in a single place. For example:

```
set(CONF_FILE "fragment_file1.conf")
list(APPEND CONF_FILE "fragment_file2.conf")
```

See *The Initial Configuration* for more information.

3. If your application uses devicetree overlays, you may need to set `DTC_OVERLAY_FILE`. See *Set devicetree overlays*.
4. If your application has its own kernel configuration options, create a `Kconfig` file in the same directory as your application's `CMakeLists.txt`.

See *the Kconfig section of the manual* for detailed Kconfig documentation.

An (unlikely) advanced use case would be if your application has its own unique configuration **options** that are set differently depending on the build configuration.

If you just want to set application specific **values** for existing Zephyr configuration options, refer to the `CONF_FILE` description above.

Structure your `Kconfig` file like this:

```
# SPDX-License-Identifier: Apache-2.0

mainmenu "Your Application Name"

# Your application configuration options go here

# Sources Kconfig.zephyr in the Zephyr root directory.
#
# Note: All 'source' statements work relative to the Zephyr root directory (due
# to the $srctree environment variable being set to $ZEPHYR_BASE). If you want
# to 'source' relative to the current Kconfig file instead, use 'rsource' (or a
# path relative to the Zephyr root).
source "Kconfig.zephyr"
```

---

**Note:** Environment variables in `source` statements are expanded directly, so you do not need to define an option `env="ZEPHYR_BASE"` Kconfig “bounce” symbol. If you use such a symbol, it must have the same name as the environment variable.

See *Kconfig extensions* for more information.

---

The `Kconfig` file is automatically detected when placed in the application directory, but it is also possible for it to be found elsewhere if the CMake variable `KCONFIG_ROOT` is set with an absolute path.

5. Specify that the application requires Zephyr on a new line, **after any lines added from the steps above**:

```
find_package(Zephyr)
project(my_zephyr_app)
```

---

**Note:** `find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})` can be used if enforcing a specific Zephyr installation by explicitly setting the `ZEPHYR_BASE` environment variable should be supported. All samples in Zephyr supports the `ZEPHYR_BASE` environment variable.

---

6. Now add any application source files to the ‘app’ target library, each on their own line, like so:

```
target_sources(app PRIVATE src/main.c)
```

Below is a simple example `CMakeList.txt`:

```
set(BOARD qemu_x86)

find_package(Zephyr)
project(my_zephyr_app)

target_sources(app PRIVATE src/main.c)
```

The Cmake property `HEX_FILES_TO_MERGE` leverages the application configuration provided by Kconfig and CMake to let you merge externally built hex files with the hex file generated when building the Zephyr application. For example:

```
set_property(GLOBAL APPEND PROPERTY HEX_FILES_TO_MERGE
  ${app_bootloader_hex}
  ${PROJECT_BINARY_DIR}/${KERNEL_HEX_NAME}
  ${app_provision_hex})
```

## 6.8 CMakeCache.txt

CMake uses a `CMakeCache.txt` file as persistent key/value string storage used to cache values between runs, including compile and build options and paths to library dependencies. This cache file is created when CMake is run in an empty build folder.

For more details about the `CMakeCache.txt` file see the official CMake documentation [runningcmake](#) .

## 6.9 Application Configuration

### 6.9.1 Kconfig Configuration

Application configuration options are usually set in `prj.conf` in the application directory. For example, C++ support could be enabled with this assignment:

```
CONFIG_CPLUSPLUS=y
```

Looking at existing samples is a good way to get started.

See [Setting Kconfig configuration values](#) for detailed documentation on setting Kconfig configuration values. The [The Initial Configuration](#) section on the same page explains how the initial configuration is derived. See `configuration_options` for a complete list of configuration options. See [Hardening Tool](#) for security information related with Kconfig options.

The other pages in the [Kconfig section of the manual](#) are also worth going through, especially if you planning to add new configuration options.

## 6.9.2 Devicetree Overlays

See [Set devicetree overlays](#).

## 6.10 Application-Specific Code

Application-specific source code files are normally added to the application's `src` directory. If the application adds a large number of files the developer can group them into sub-directories under `src`, to whatever depth is needed.

Application-specific source code should not use symbol name prefixes that have been reserved by the kernel for its own use. For more information, see [Naming Conventions](#).

### 6.10.1 Third-party Library Code

It is possible to build library code outside the application's `src` directory but it is important that both application and library code targets the same Application Binary Interface (ABI). On most architectures there are compiler flags that control the ABI targeted, making it important that both libraries and applications have certain compiler flags in common. It may also be useful for glue code to have access to Zephyr kernel header files.

To make it easier to integrate third-party components, the Zephyr build system has defined CMake functions that give application build scripts access to the zephyr compiler options. The functions are documented and defined in `cmake/extensions.cmake` and follow the naming convention `zephyr_get_<type>_<format>`.

The following variables will often need to be exported to the third-party build system.

- `CMAKE_C_COMPILER`, `CMAKE_AR`.
- `ARCH` and `BOARD`, together with several variables that identify the Zephyr kernel version.

`samples/application_development/external_lib` is a sample project that demonstrates some of these features.

## 6.11 Building an Application

The Zephyr build system compiles and links all components of an application into a single application image that can be run on simulated hardware or real hardware.

Like any other CMake-based system, the build process takes place *in two stages*. First, build files (also known as a buildsystem) are generated using the `cmake` command-line tool while specifying a generator. This generator determines the native build tool the buildsystem will use in the second stage. The second stage runs the native build tool to actually build the source files and generate an image. To learn more about these concepts refer to the [CMake introduction](#) in the official CMake documentation.

Although the default build tool in Zephyr is `west`, Zephyr's meta-tool, which invokes `cmake` and the underlying build tool (`ninja` or `make`) behind the scenes, you can also choose to invoke `cmake` directly if you prefer. On Linux and macOS you can choose between the `make` and `ninja` generators (i.e. build tools), whereas on Windows you need to use `ninja`, since `make` is not supported on this platform. For simplicity we will use `ninja` throughout this guide, and if you choose to use `west` build to build your application know that it will default to `ninja` under the hood.

As an example, let's build the Hello World sample for the `reel_board`:

Using `west`:

```
west build -b reel_board samples/hello_world
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsysteM:
cmake -B build -GNinja -DBOARD=reel_board samples/hello_world

# Now run ninja on the generated build system:
ninja -C build
```

On Linux and macOS, you can also build with make instead of ninja:

Using west:

- to use make just once, add `-- -G"Unix Makefiles"` to the west build command line; see the [west build](#) documentation for an example.
- to use make by default from now on, run `west config build.generator "Unix Makefiles"`.

Using CMake directly:

```
# Use cmake to configure a Make-based buildsysteM:
cmake -B build -DBOARD=reel_board samples/hello_world

# Now run ninja on the generated build system:
make -C build
```

### 6.11.1 Basics

---

**Note:** In the below example, west is used outside of a west workspace. For this to work, you must set the `ZEPHYR_BASE` environment variable to the path of your zephyr git repository, using one of the methods on the [Environment Variables](#) page.

---

1. Navigate to the application directory `<home>/app`.
2. Enter the following commands to build the application's `zephyr.elf` image for the board specified in the command-line parameters:

Using west:

```
west build -b <board>
```

Using CMake and ninja:

```
mkdir build && cd build

# Use cmake to configure a Ninja-based buildsysteM:
cmake -GNinja -DBOARD=<board> ..

# Now run ninja on the generated build system:
ninja
```

If desired, you can build the application using the configuration settings specified in an alternate `.conf` file using the `CONF_FILE` parameter. These settings will override the settings in the application's `.config` file or its default `.conf` file. For example:

Using west:

```
west build -b <board> -- -DCONF_FILE=prj.alternate.conf
```

Using CMake and ninja:

```
mkdir build && cd build
cmake -GNinja -DBOARD=<board> -DCONF_FILE=prj.alternate.conf ..
ninja
```

As described in the previous section, you can instead choose to permanently set the board and configuration settings by either exporting BOARD and CONF\_FILE environment variables or by setting their values in your CMakeLists.txt using `set()` statements. Additionally, west allows you to [set a default board](#).

### 6.11.2 Build Directory Contents

When using the Ninja generator a build directory looks like this:

```
<home>/app/build
├── build.ninja
├── CMakeCache.txt
├── CMakeFiles
├── cmake_install.cmake
├── rules.ninja
└── zephyr
```

The most notable files in the build directory are:

- `build.ninja`, which can be invoked to build the application.
- A `zephyr` directory, which is the working directory of the generated build system, and where most generated files are created and stored.

After running `ninja`, the following build output files will be written to the `zephyr` sub-directory of the build directory. (This is **not the Zephyr base directory**, which contains the Zephyr source code etc. and is described above.)

- `.config`, which contains the configuration settings used to build the application.

---

**Note:** The previous version of `.config` is saved to `.config.old` whenever the configuration is updated. This is for convenience, as comparing the old and new versions can be handy.

---

- Various object files (`.o` files and `.a` files) containing compiled kernel and application code.
- `zephyr.elf`, which contains the final combined application and kernel binary. Other binary output formats, such as `.hex` and `.bin`, are also supported.

### 6.11.3 Rebuilding an Application

Application development is usually fastest when changes are continually tested. Frequently rebuilding your application makes debugging less painful as the application becomes more complex. It's usually a good idea to rebuild and test after any major changes to the application's source files, CMakeLists.txt files, or configuration settings.

---

**Important:** The Zephyr build system rebuilds only the parts of the application image potentially affected by the changes. Consequently, rebuilding an application is often significantly faster than building it the first time.

---

Sometimes the build system doesn't rebuild the application correctly because it fails to recompile one or more necessary files. You can force the build system to rebuild the entire application from scratch with the following procedure:

1. Open a terminal console on your host computer, and navigate to the build directory `<home>/app/build`.
2. Enter one of the following commands, depending on whether you want to use `west` or `cmake` directly to delete the application's generated files, except for the `.config` file that contains the application's current configuration information.

```
west build -t clean
```

or

```
ninja clean
```

Alternatively, enter one of the following commands to delete *all* generated files, including the `.config` files that contain the application's current configuration information for those board types.

```
west build -t pristine
```

or

```
ninja pristine
```

If you use `west`, you can take advantage of its capability to automatically *make the build folder pristine* whenever it is required.

3. Rebuild the application normally following the steps specified in [Building an Application](#) above.

#### 6.11.4 Building for a board revision

The Zephyr build system has support for specifying multiple hardware revisions of a single board with small variations. Using revisions allows the board support files to make minor adjustments to a board configuration without duplicating all the files described in [Create your board directory](#) for each revision.

To build for a particular revision, use `<board>@<revision>` instead of plain `<board>`. For example:

Using `west`:

```
west build -b <board>@<revision>
```

Using `CMake` and `ninja`:

```
mkdir build && cd build
cmake -GNinja -DBOARD=<board>@<revision> ..
ninja
```

Check your board's documentation for details on whether it has multiple revisions, and what revisions are supported.

When targeting a board revision, the active revision will be printed at `CMake` configure time, like this:

```
-- Board: plank, Revision: 1.5.0
```

## 6.12 Run an Application

An application image can be run on a real board or emulated hardware.

### 6.12.1 Running on a Board

Most boards supported by Zephyr let you flash a compiled binary using the `flash` target to copy the binary to the board and run it. Follow these instructions to flash and run an application on real hardware:

1. Build your application, as described in [Building an Application](#).
2. Make sure your board is attached to your host computer. Usually, you'll do this via USB.
3. Run one of these console commands from the build directory, `<home>/app/build`, to flash the compiled Zephyr image and run it on your board:

```
west flash
```

or

```
ninja flash
```

The Zephyr build system integrates with the board support files to use hardware-specific tools to flash the Zephyr binary to your hardware, then run it.

Each time you run the flash command, your application is rebuilt and flashed again.

In cases where board support is incomplete, flashing via the Zephyr build system may not be supported. If you receive an error message about flash support being unavailable, consult your board's documentation for additional information on how to flash your board.

---

**Note:** When developing on Linux, it's common to need to install board-specific udev rules to enable USB device access to your board as a non-root user. If flashing fails, consult your board's documentation to see if this is necessary.

---

### 6.12.2 Running in an Emulator

The kernel has built-in emulator support for QEMU (on Linux/macOS only, this is not yet supported on Windows). It allows you to run and test an application virtually, before (or in lieu of) loading and running it on actual target hardware. Follow these instructions to run an application via QEMU:

1. Build your application for one of the QEMU boards, as described in [Building an Application](#).  
For example, you could set `BOARD` to:
  - `qemu_x86` to emulate running on an x86-based board
  - `qemu_cortex_m3` to emulate running on an ARM Cortex M3-based board
2. Run one of these console commands from the build directory, `<home>/app/build`, to run the Zephyr binary in QEMU:

```
west build -t run
```

or

```
ninja run
```

3. Press `Ctrl A, X` to stop the application from running in QEMU.

The application stops running and the terminal console prompt redisplays.

Each time you execute the run command, your application is rebuilt and run again.

---

**Note:** If the (Linux only) [Zephyr SDK](#) is installed, the run target will use the SDK's QEMU binary by default. To use another version of QEMU, [set the environment variable](#) `QEMU_BIN_PATH` to the path of the QEMU binary you want to use instead.

---

## 6.13 Application Debugging

This section is a quick hands-on reference to start debugging your application with QEMU. Most content in this section is already covered in [QEMU](#) and [GNU Debugger](#) reference manuals.

In this quick reference, you'll find shortcuts, specific environmental variables, and parameters that can help you to quickly set up your debugging environment.

The simplest way to debug an application running in QEMU is using the GNU Debugger and setting a local GDB server in your development system through QEMU.

You will need an Executable and Linkable Format (ELF) binary image for debugging purposes. The build system generates the image in the build directory. By default, the kernel binary name is `zephyr.elf`. The name can be changed using a Kconfig option.

We will use the standard 1234 TCP port to open a GDB (GNU Debugger) server instance. This port number can be changed for a port that best suits the development environment.

You can run QEMU to listen for a “gdb connection” before it starts executing any code to debug it.

```
qemu -s -S <image>
```

will setup Qemu to listen on port 1234 and wait for a GDB connection to it.

The options used above have the following meaning:

- `-S` Do not start CPU at startup; rather, you must type ‘c’ in the monitor.
- `-s` Shorthand for `-gdb tcp::1234`: open a GDB server on TCP port 1234.

To debug with QEMU and to start a GDB server and wait for a remote connect, run either of the following inside the build directory of an application:

```
ninja debugserver
```

The build system will start a QEMU instance with the CPU halted at startup and with a GDB server instance listening at the TCP port 1234.

Using a local GDB configuration `.gdbinit` can help initialize your GDB instance on every run. In this example, the initialization file points to the GDB server instance. It configures a connection to a remote target at the local host on the TCP port 1234. The initialization sets the kernel's root directory as a reference.

The `.gdbinit` file contains the following lines:

```
target remote localhost:1234
dir ZEPHYR_BASE
```

---

**Note:** Substitute the correct [ZEPHYR\\_BASE](#) for your system.

---

Execute the application to debug from the same directory that you chose for the `.gdbinit` file. The command can include the `--tui` option to enable the use of a terminal user interface. The following commands connects to the GDB server using `gdb`. The command loads the symbol table from the elf binary file. In this example, the elf binary file name corresponds to `zephyr.elf` file:

```
....../path/to/gdb --tui zephyr.elf
```

**Note:** The GDB version on the development system might not support the `--tui` option. Please make sure you use the GDB binary from the SDK which corresponds to the toolchain that has been used to build the binary.

If you are not using a `.gdbinit` file, issue the following command inside GDB to connect to the remote GDB server on port 1234:

```
(gdb) target remote localhost:1234
```

Finally, the command below connects to the GDB server using the Data Displayer Debugger (ddd). The command loads the symbol table from the elf binary file, in this instance, the `zephyr.elf` file.

The DDD (Data Displayer Debugger) may not be installed in your development system by default. Follow your system instructions to install it. For example, use `sudo apt-get install ddd` on an Ubuntu system.

```
ddd --gdb --debugger "gdb zephyr.elf"
```

Both commands execute the GDB (GNU Debugger). The command name might change depending on the toolchain you are using and your cross-development tools.

## 6.14 Custom Board, Devicetree and SOC Definitions

In cases where the board or platform you are developing for is not yet supported by Zephyr, you can add board, Devicetree and SOC definitions to your application without having to add them to the Zephyr tree.

The structure needed to support out-of-tree board and SOC development is similar to how boards and SOC are maintained in the Zephyr tree. By using this structure, it will be much easier to upstream your platform related work into the Zephyr tree after your initial development is done.

Add the custom board to your application or a dedicated repository using the following structure:

```
boards/
soc/
CMakeLists.txt
prj.conf
README.rst
src/
```

where the `boards` directory hosts the board you are building for:

```

.
├── boards
│   ├── x86
│   │   └── my_custom_board
│   │       ├── doc
│   │       │   └── img
│   │       └── support
└── src
```

and the `soc` directory hosts any SOC code. You can also have boards that are supported by a SOC that is available in the Zephyr tree.

### 6.14.1 Boards

Use the proper architecture folder name (e.g., x86, arm, etc.) under boards for `my_custom_board`. (See boards for a list of board architectures.)

Documentation (under `doc/`) and support files (under `support/`) are optional, but will be needed when submitting to Zephyr.

The contents of `my_custom_board` should follow the same guidelines for any Zephyr board, and provide the following files:

```
my_custom_board_defconfig
my_custom_board.dts
my_custom_board.yaml
board.cmake
board.h
CMakeLists.txt
doc/
dts_fixup.h
Kconfig.board
Kconfig.defconfig
pinmux.c
support/
```

Once the board structure is in place, you can build your application targeting this board by specifying the location of your custom board information with the `-DBOARD_ROOT` parameter to the CMake build system:

Using west:

```
west build -b <board name> -- -DBOARD_ROOT=<path to boards>
```

Using CMake and ninja:

```
cmake -B build -GNinja -DBOARD=<board name> -DBOARD_ROOT=<path to boards> .
ninja -C build
```

This will use your custom board configuration and will generate the Zephyr binary into your application directory.

You can also define the `BOARD_ROOT` variable in the application `CMakeLists.txt` file. Make sure to do so **before** pulling in the Zephyr boilerplate with `find_package(Zephyr ...)`.

---

**Note:** When specifying `BOARD_ROOT` in a `CMakeLists.txt`, then an absolute path must be provided, for example `list(APPEND BOARD_ROOT ${CMAKE_CURRENT_SOURCE_DIR}/<extra-board-root>`. When using `-DBOARD_ROOT=<board-root>` both absolute and relative paths can be used. Relative paths are treated relatively to the application directory.

---

### 6.14.2 SOC Definitions

Similar to board support, the structure is similar to how SOCs are maintained in the Zephyr tree, for example:

```
soc
├── arm
│   └── st_stm32
│       ├── common
│       └── stm3210
```

The file `soc/Kconfig` will create the top-level SoC/CPU/Configuration Selection menu in Kconfig.

Out of tree SoC definitions can be added to this menu using the `SOC_ROOT` CMake variable. This variable contains a semicolon-separated list of directories which contain SoC support files.

Following the structure above, the following files can be added to load more SoCs into the menu.

```
soc
├── arm
│   └── st_stm32
│       ├── Kconfig
│       ├── Kconfig.soc
│       └── Kconfig.defconfig
```

The Kconfig files above may describe the SoC or load additional SoC Kconfig files.

An example of loading stm3210 specific Kconfig files in this structure:

```
soc
├── arm
│   └── st_stm32
│       ├── Kconfig.soc
│       ├── stm3210
│       └── Kconfig.series
```

can be done with the following content in `st_stm32/Kconfig.soc`:

```
rsource "*/Kconfig.series"
```

Once the SOC structure is in place, you can build your application targeting this platform by specifying the location of your custom platform information with the `-DSOC_ROOT` parameter to the CMake build system:

Using west:

```
west build -b <board name> -- -DSOC_ROOT=<path to soc> -DBOARD_ROOT=<path to boards>
```

Using CMake and ninja:

```
cmake -B build -GNinja -DBOARD=<board name> -DSOC_ROOT=<path to soc> -DBOARD_ROOT=
↳<path to boards> .
ninja -C build
```

This will use your custom platform configurations and will generate the Zephyr binary into your application directory.

See [Build settings](#) for information on setting `SOC_ROOT` in a module's `zephyr/module.yml` file.

Or you can define the `SOC_ROOT` variable in the application `CMakeLists.txt` file. Make sure to do so **before** pulling in the Zephyr boilerplate with `find_package(Zephyr ...)`.

---

**Note:** When specifying `SOC_ROOT` in a `CMakeLists.txt`, then an absolute path must be provided, for example `list(APPEND SOC_ROOT ${CMAKE_CURRENT_SOURCE_DIR}/<extra-soc-root>.` When using `-DSOC_ROOT=<soc-root>` both absolute and relative paths can be used. Relative paths are treated relatively to the application directory.

---

### 6.14.3 Devicetree Definitions

Devicetree directory trees are found in `APPLICATION_SOURCE_DIR`, `BOARD_DIR`, and `ZEPHYR_BASE`, but additional trees, or `DTS_ROOTs`, can be added by creating this directory tree:

```
include/  
dts/common/  
dts/arm/  
dts/  
dts/bindings/
```

Where ‘arm’ is changed to the appropriate architecture. Each directory is optional. The binding directory contains bindings and the other directories contain files that can be included from DT sources.

Once the directory structure is in place, you can use it by specifying its location through the DTS\_ROOT CMake Cache variable:

Using west:

```
west build -b <board name> -- -DDTS_ROOT=<path to dts root>
```

Using CMake and ninja:

```
cmake -B build -GNinja -DBOARD=<board name> -DDTS_ROOT=<path to dts root> .  
ninja -C build
```

You can also define the variable in the application CMakeLists.txt file. Make sure to do so **before** pulling in the Zephyr boilerplate with `find_package(Zephyr ...)`.

---

**Note:** When specifying DTS\_ROOT in a CMakeLists.txt, then an absolute path must be provided, for example `list(APPEND DTS_ROOT ${CMAKE_CURRENT_SOURCE_DIR}/<extra-dts-root>.` When using `-DDTS_ROOT=<dts-root>` both absolute and relative paths can be used. Relative paths are treated relatively to the application directory.

---

Devicetree source are passed through the C preprocessor, so you can include files that can be located in a DTS\_ROOT directory. By convention devicetree include files have a .dtsi extension.

You can also use the preprocessor to control the content of a devicetree file, by specifying directives through the DTS\_EXTRA\_CPPFLAGS CMake Cache variable:

Using west:

```
west build -b <board name> -- -DDTS_EXTRA_CPPFLAGS=-DTEST_ENABLE_FEATURE
```

Using CMake and ninja:

```
cmake -B build -GNinja -DBOARD=<board name> -DDTS_EXTRA_CPPFLAGS=-DTEST_ENABLE_  
↪FEATURE .  
ninja -C build
```

## 6.15 Debug with Eclipse

### 6.15.1 Overview

CMake supports generating a project description file that can be imported into the Eclipse Integrated Development Environment (IDE) and used for graphical debugging.

The [GNU MCU Eclipse plug-ins](#) provide a mechanism to debug ARM projects in Eclipse with pyOCD, Segger J-Link, and OpenOCD debugging tools.

The following tutorial demonstrates how to debug a Zephyr application in Eclipse with pyOCD in Windows. It assumes you have already installed the GCC ARM Embedded toolchain and pyOCD.

## 6.15.2 Set Up the Eclipse Development Environment

1. Download and install [Eclipse IDE for C/C++ Developers](#).
2. In Eclipse, install the GNU MCU Eclipse plug-ins by opening the menu Window->Eclipse Marketplace..., searching for GNU MCU Eclipse, and clicking Install on the matching result.
3. Configure the path to the pyOCD GDB server by opening the menu Window->Preferences, navigating to MCU, and setting the Global pyOCD Path.

## 6.15.3 Generate and Import an Eclipse Project

1. Set up a GNU Arm Embedded toolchain as described in [3rd Party Toolchains](#).
2. Navigate to a folder outside of the Zephyr tree to build your application.

```
# On Windows
cd %userprofile%
```

**Note:** If the build directory is a subdirectory of the source directory, as is usually done in Zephyr, CMake will warn:

“The build directory is a subdirectory of the source directory.

This is not supported well by Eclipse. It is strongly recommended to use a build directory which is a sibling of the source directory.”

3. Configure your application with CMake and build it with ninja. Note the different CMake generator specified by the `-G"Eclipse CDT4 - Ninja"` argument. This will generate an Eclipse project description file, `.project`, in addition to the usual ninja build files.

Using west:

```
west build -b frdm_k64f %ZEPHYR_BASE%\samples\synchronization -- -G"Eclipse CDT4 - Ninja"
```

Using CMake and ninja:

```
cmake -B build -GNinja -DBOARD=frdm_k64f -G"Eclipse CDT4 - Ninja" %ZEPHYR_BASE%\samples\synchronization
ninja -C build
```

4. In Eclipse, import your generated project by opening the menu File->Import... and selecting the option Existing Projects into Workspace. Browse to your application build directory in the choice, Select root directory:. Check the box for your project in the list of projects found and click the Finish button.

## 6.15.4 Create a Debugger Configuration

1. Open the menu Run->Debug Configurations....
2. Select GDB PyOCD Debugging, click the New button, and configure the following options:
  - In the Main tab:
    - Project: `my_zephyr_app@build`
    - C/C++ Application: `zephyr/zephyr.elf`
  - In the Debugger tab:

- pyOCD Setup
  - \* Executable path: `$pyocd_path\pyocd_executable`
  - \* Uncheck “Allocate console for semihosting”
- Board Setup
  - \* Bus speed: 8000000 Hz
  - \* Uncheck “Enable semihosting”
- GDB Client Setup
  - \* Executable path example (use your GNUARMEMB\_TOOLCHAIN\_PATH): `C:\gcc-arm-none-eabi-6_2017-q2-update\bin\arm-none-eabi-gdb.exe`
- In the SVD Path tab:
  - File path: `<workspace top>\modules\hal\nxp\mcux\devices\MK64F12\MK64F12.xml`

---

**Note:** This is optional. It provides the SoC’s memory-mapped register addresses and bitfields to the debugger.

---

3. Click the Debug button to start debugging.

### 6.15.5 RTOS Awareness

Support for Zephyr RTOS awareness is implemented in [pyOCD v0.11.0](#) and later. It is compatible with GDB PyOCD Debugging in Eclipse, but you must enable `CONFIG_DEBUG_THREAD_INFO=y` in your application.

# Chapter 7

## API Reference

### 7.1 API Status / Guidelines

#### 7.1.1 API Overview

The table lists Zephyr's APIs and information about them, including their current *stability level*.

API	Status	Version Introduced	Version Modified
<a href="#">ADC</a>	Stable	1.0	2.6
<a href="#">Audio Codec</a>	Experimental	1.13	1.13
<a href="#">Audio DMIC</a>	Experimental	1.13	1.13
<a href="#">Bluetooth</a>	Stable	1.0	2.4
<a href="#">Clock Control</a>	Stable	1.0	2.6
<a href="#">CoAP</a>	Unstable	1.10	2.4
<a href="#">Controller Area Network (CAN)</a>	Unstable	1.14	2.6
<a href="#">Counter</a>	Unstable	1.14	2.6
<a href="#">Crypto</a>	Stable	1.7	2.2
<a href="#">DAC</a>	Experimental	2.3	2.3
<a href="#">DMA</a>	Stable	1.5	2.6
<a href="#">Device Driver Model</a>	Stable	1.0	2.4
<a href="#">Devicetree API</a>	Stable	2.2	2.6
<a href="#">Disk Access</a>	Stable	1.6	2.0
<a href="#">Display Interface</a>	Unstable	1.14	2.2
<a href="#">EC Host Command</a>	Experimental	2.4	2.4
<a href="#">Error Detection And Correction (EDAC) API</a>	Experimental	2.5	2.5
<a href="#">EEPROM</a>	Stable	2.1	2.1
<a href="#">Entropy</a>	Stable	1.10	1.12
<a href="#">File Systems</a>	Stable	1.5	2.4
<a href="#">Flash</a>	Stable	1.2	2.6
<a href="#">Flash Circular Buffer (FCB)</a>	Stable	1.11	2.1
<a href="#">Flash map</a>	Stable	1.11	2.6
<a href="#">GNA</a>	Experimental	1.14	1.14
<a href="#">GPIO</a>	Stable	1.0	2.6
<a href="#">Hardware Information</a>	Stable	1.14	2.3
<a href="#">I2C EEPROM Slave</a>	Stable	1.13	1.13
<a href="#">I2C</a>	Stable	1.0	2.6
<a href="#">I2C Slave API</a>	Experimental	1.12	1.12
<a href="#">I2S</a>	Stable	1.9	2.6
<a href="#">IPM</a>	Stable	1.0	2.4

continues on next page

Table 1 – continued from previous page

API	Status	Version Introduced	Version Modified
<a href="#">KSCAN</a>	Stable	2.1	2.6
<a href="#">Kernel Services</a>	Stable	1.0	2.6
<a href="#">LED</a>	Stable	1.12	2.6
<a href="#">Lightweight M2M (LWM2M)</a>	Unstable	1.9	2.5
<a href="#">Logging</a>	Stable	1.13	1.14
<a href="#">MQTT</a>	Unstable	1.14	2.4

<a href="#">Video</a>	Stable	2.1	2.6
<a href="#">Watchdog</a>	Stable	1.0	2.0

### 7.1.2 API Lifecycle

Developers using Zephyr’s APIs need to know how long they can trust that a given API will not change in future releases. At the same time, developers maintaining and extending Zephyr’s APIs need to be able to introduce new APIs that aren’t yet fully proven, and to potentially retire old APIs when they’re no longer optimal or supported by the underlying platforms.

An up-to-date table of all APIs and their maturity level can be found in the [API Overview](#) page.

#### Experimental

Experimental APIs denote that a feature was introduced recently, and may change or be removed in future versions. Try it out and provide feedback to the community via the [Developer mailing list](#).

The following requirements apply to all new APIs:

- Documentation of the API (usage) explaining its design and assumptions, how it is to be used, current implementation limitations, and future potential, if appropriate.
- The API introduction should be accompanied by at least one implementation of said API (in the case of peripheral APIs, this corresponds to one driver)
- At least one sample using the new API (may only build on one single board)

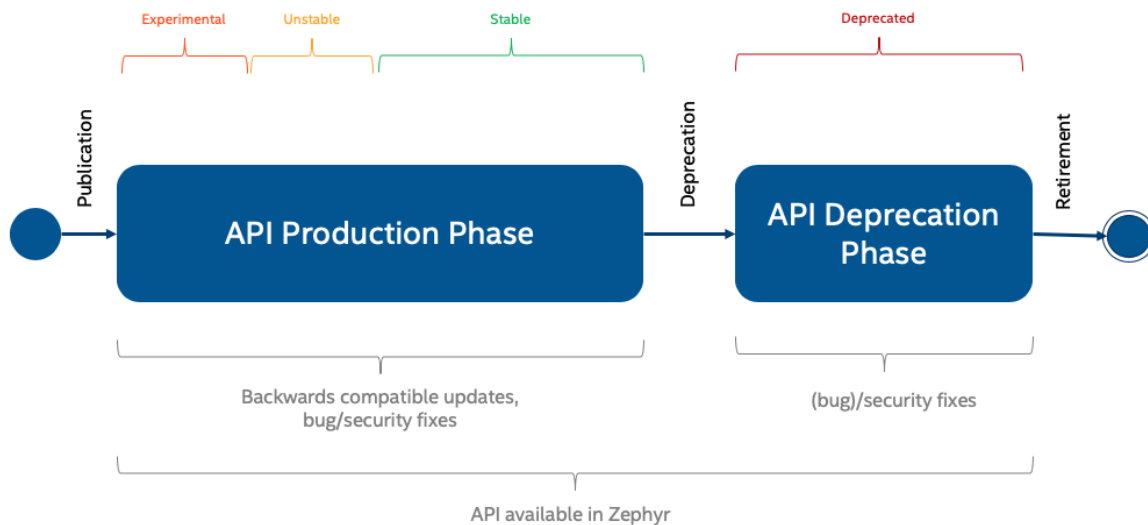

Fig. 1: API Life Cycle

**Peripheral APIs (Hardware Related)** When introducing an API (public header file with documentation) for a new peripheral or driver subsystem, review of the API is enforced and is driven by the API working group consisting of representatives from different vendors.

The API shall be promoted to `unstable` when it has at least two implementations on different hardware platforms.

### Unstable

The API is in the process of settling, but has not yet had sufficient real-world testing to be considered stable. The API is considered generic in nature and can be used on different hardware platforms.

---

**Note:** Changes will not be announced.

---

**Peripheral APIs (Hardware Related)** The API shall be promoted from `experimental` to `unstable` when it has at least two implementations on different hardware platforms.

**Hardware Agnostic APIs** For hardware agnostic APIs, multiple applications using it are required to promote an API from `experimental` to `unstable`.

### Stable

The API has proven satisfactory, but cleanup in the underlying code may cause minor changes. Backwards-compatibility will be maintained if reasonable.

An API can be declared `stable` after fulfilling the following requirements:

- Test cases for the new API with 100% coverage
- Complete documentation in code. All public interfaces shall be documented and available in online documentation.
- The API has been in-use and was available in at least 2 development releases

- Stable APIs can get backward compatible updates, bug fixes and security fixes at any time.

In order to declare an API stable, the following steps need to be followed:

1. A Pull Request must be opened that changes the corresponding entry in the [API Overview](#) table
2. An email must be sent to the `devel` mailing list announcing the API upgrade request
3. The Pull Request must be submitted for discussion in the next [Zephyr API meeting](#) where, barring any objections, the Pull Request will be merged

**Introducing incompatible changes** A stable API, as described above strives to remain backwards-compatible through its life-cycle. There are however cases where fulfilling this objective prevents technical progress or is simply unfeasible without unreasonable burden on the maintenance of the API and its implementation(s).

An incompatible change is defined as one that forces users to modify their existing code in order to maintain the current behavior of their application. The need for recompilation of applications (without changing the application itself) is not considered an incompatible change.

In order to restrict and control the introduction of a change that breaks the promise of backwards compatibility the following steps must be followed whenever such a change is considered necessary in order to accept it in the project:

1. An [RFC issue](#) must be opened on GitHub with the following content:

```
Title:      RFC: API Change: <subsystem>
Contents:  - Problem Description:
            - Background information on why the change is required
            - Proposed Change (detailed):
              - Brief description of the API change
            - Detailed RFC:
              - Function call changes
              - Device Tree changes (source and bindings)
              - Kconfig option changes
            - Dependencies:
              - Impact to users of the API, including the steps required
                to adapt out-of-tree users of the API to the change
```

Instead of a written description of the changes, the RFC issue may link to a Pull Request containing those changes in code form.

2. The RFC issue must be labeled with the GitHub `Stable API Change` label
3. The RFC issue must be submitted for discussion in the next [Zephyr API meeting](#)
4. An email must be sent to the `devel` mailing list with a subject identical to the RFC issue title and that links to the RFC issue

The RFC will then receive feedback through issue comments and will also be discussed in the Zephyr API meeting, where the stakeholders and the community at large will have a chance to discuss it in detail.

Finally, and if not done as part of the first step, a Pull Request must be opened on GitHub. It is left to the person proposing the change to decide whether to introduce both the RFC and the Pull Request at the same time or to wait until the RFC has gathered consensus enough so that the implementation can proceed with confidence that it will be accepted. The Pull Request must include the following:

- A title that matches the RFC issue
- A link to the RFC issue
- The actual changes to the API
  - Changes to the API header file
  - Changes to the API implementation(s)

- Changes to the relevant API documentation
- Changes to Device Tree source and bindings
- The changes required to adapt in-tree users of the API to the change. Depending on the scope of this task this might require additional help from the corresponding maintainers
- An entry in the “API Changes” section of the release notes for the next upcoming release
- The labels `API`, `Stable API Change` and `Release Notes`, as well as any others that are applicable

Once the steps above have been completed, the outcome of the proposal will depend on the approval of the actual Pull Request by the maintainer of the corresponding subsystem. As with any other Pull Request, the author can request for it to be discussed and ultimately even voted on in the [Zephyr TSC meeting](#).

If the Pull Request is merged then an email must be sent to the `devel` and `user` mailing lists informing them of the change.

---

**Note:** Incompatible changes will be announced in the “API Changes” section of the release notes.

---

## Deprecated

---

**Note:** Unstable APIs can be removed without deprecation at any time. Deprecation and removal of APIs will be announced in the “API Changes” section of the release notes.

---

The following are the requirements for deprecating an existing API:

- Deprecation Time (stable APIs): 2 Releases The API needs to be marked as deprecated in at least two full releases. For example, if an API was first deprecated in release 1.14, it will be ready to be removed in 1.16 at the earliest. There may be special circumstances, determined by the API working group, where an API is deprecated sooner.
- What is required when deprecating:
  - Mark as deprecated. This can be done by using the compiler itself (`__deprecated` for function declarations and `__DEPRECATED_MACRO` for macro definitions), or by introducing a Kconfig option (typically one that contains the `DEPRECATED` word in it) that, when enabled, reverts the APIs back to their previous form
  - Document the deprecation
  - Include the deprecation in the “API Changes” of the release notes for the next upcoming release
  - Code using the deprecated API needs to be modified to remove usage of said API
  - The change needs to be atomic and bisectable
  - Create a GitHub issue to track the removal of the deprecated API, and add it to the roadmap targeting the appropriate release (in the example above, 1.16).

During the deprecation waiting period, the API will be in the `deprecated` state. The Zephyr maintainers will track usage of deprecated APIs on `docs.zephyrproject.org` and support developers migrating their code. Zephyr will continue to provide warnings:

- API documentation will inform users that the API is deprecated.
- Attempts to use a deprecated API at build time will log a warning to the console.

## Retired

In this phase, the API is removed.

The target removal date is 2 releases after deprecation is announced. The Zephyr maintainers will decide when to actually remove the API: this will depend on how many developers have successfully migrated from the deprecated API, and on how urgently the API needs to be removed.

If it's OK to remove the API, it will be removed. The maintainers will remove the corresponding documentation, and communicate the removal in the usual ways: the release notes, mailing lists, Github issues and pull-requests.

If it's not OK to remove the API, the maintainers will continue to support migration and update the roadmap with the aim to remove the API in the next release.

### 7.1.3 API Design Guidelines

Zephyr development and evolution is a group effort, and to simplify maintenance and enhancements there are some general policies that should be followed when developing a new capability or interface.

#### Using Callbacks

Many APIs involve passing a callback as a parameter or as a member of a configuration structure. The following policies should be followed when specifying the signature of a callback:

- The first parameter should be a pointer to the object most closely associated with the callback. In the case of device drivers this would be `struct device *dev`. For library functions it may be a pointer to another object that was referenced when the callback was provided.
- The next parameter(s) should be additional information specific to the callback invocation, such as a channel identifier, new status value, and/or a message pointer followed by the message length.
- The final parameter should be a `void *user_data` pointer carrying context that allows a shared callback function to locate additional material necessary to process the callback.

An exception to providing `user_data` as the last parameter may be allowed when the callback itself was provided through a structure that will be embedded in another structure. An example of such a case is [gpio\\_callback](#), normally defined within a data structure specific to the code that also defines the callback function. In those cases further context can be accessed by the callback indirectly by [CONTAINER\\_OF](#).

#### Examples

- The requirements of [k\\_timer\\_expiry\\_t](#) invoked when a system timer alarm fires are satisfied by:

```
void handle_timeout(struct k_timer *timer)
{ ... }
```

The assumption here, as with [gpio\\_callback](#), is that the timer is embedded in a structure reachable from [CONTAINER\\_OF](#) that can provide additional context to the callback.

- The requirements of [counter\\_alarm\\_callback\\_t](#) invoked when a counter device alarm fires are satisfied by:

```
void handle_alarm(const struct device *dev,
                 uint8_t chan_id,
                 uint32_t ticks,
                 void *user_data)
{ ... }
```

This provides more complete useful information, including which counter channel timed-out and the counter value at which the timeout occurred, as well as user context which may or may not be the [counter\\_alarm\\_cfg](#) used to register the callback, depending on user needs.

## Conditional Data and APIs

APIs and libraries may provide features that are expensive in RAM or code size but are optional in the sense that some applications can be implemented without them. Examples of such feature include **:kconfig: capturing a timestamp <CONFIG\_CAN\_RX\_TIMESTAMP>** or **:kconfig: providing an alternative interface <CONFIG\_SPI\_ASYNC>**. The developer in coordination with the community must determine whether enabling the features is to be controllable through a Kconfig option.

In the case where a feature is determined to be optional the following practices should be followed.

- Any data that is accessed only when the feature is enabled should be conditionally included via `#ifdef CONFIG_MYFEATURE` in the structure or union declaration. This reduces memory use for applications that don't need the capability.
- Function declarations that are available only when the option is enabled should be provided unconditionally. Add a note in the description that the function is available only when the specified feature is enabled, referencing the required Kconfig symbol by name. In the cases where the function is used but not enabled the definition of the function shall be excluded from compilation, so references to the unsupported API will result in a link-time error.
- Where code specific to the feature is isolated in a source file that has no other content that file should be conditionally included in `CMakeLists.txt`:

```
zephyr_sources_ifdef(CONFIG_MYFEATURE foo_funcs.c)
```

- Where code specific to the feature is part of a source file that has other content the feature-specific code should be conditionally processed using `#ifdef CONFIG_MYFEATURE`.

The Kconfig flag used to enable the feature should be added to the `PREDEFINED` variable in `doc/zephyr.doxyfile.in` to ensure the conditional API and functions appear in generated documentation.

## Return Codes

Implementations of an API, for example an API for accessing a peripheral might implement only a subset of the functions that is required for minimal operation. A distinction is needed between APIs that are not supported and those that are not implemented or optional:

- APIs that are supported but not implemented shall return `-ENOSYS`.
- Optional APIs that are not supported by the hardware should be implemented and the return code in this case shall be `-ENOTSUP`.
- When an API is implemented, but the particular combination of options requested in the call cannot be satisfied by the implementation the call shall return `-ENOTSUP`. (For example, a request for a level-triggered GPIO interrupt on hardware that supports only edge-triggered interrupts)

### 7.1.4 API Terminology

The following terms may be used as shorthand API tags to indicate the allowed calling context (thread, ISR, pre-kernel), the effect of a call on the current thread state, and other behavioral characteristics.

**reschedule** if executing the function reaches a reschedule point

**sleep** if executing the function can cause the invoking thread to sleep

**no-wait** if a parameter to the function can prevent the invoking thread from trying to sleep

**isr-ok** if the function can be safely called and will have its specified effect whether invoked from interrupt or thread context

**pre-kernel-ok** if the function can be safely called before the kernel has been fully initialized and will have its specified effect when invoked from that context.

**async** if the function may return before the operation it initializes is complete (i.e. function return and operation completion are asynchronous)

**supervisor** if the calling thread must have supervisor privileges to execute the function

Details on the behavioral impact of each attribute are in the following sections.

### reschedule

The reschedule attribute is used on a function that can reach a [reschedule point](#) within its execution.

**Details** The significance of this attribute is that when a rescheduling function is invoked by a thread it is possible for that thread to be suspended as a consequence of a higher-priority thread being made ready. Whether the suspension actually occurs depends on the operation associated with the reschedule point and the relative priorities of the invoking thread and the head of the ready queue.

Note that in the case of timeslicing, or reschedule points executed from interrupts, any thread may be suspended in any function.

Functions that are not **reschedule** may be invoked from either thread or interrupt context.

Functions that are **reschedule** may be invoked from thread context.

Functions that are **reschedule** but not **sleep** may be invoked from interrupt context.

### sleep

The sleep attribute is used on a function that can cause the invoking thread to [sleep](#).

**Explanation** This attribute is of relevance specifically when considering applications that use only non-preemptible threads, because the kernel will not replace a running cooperative-only thread at a reschedule point unless that thread has explicitly invoked an operation that caused it to sleep.

This attribute does not imply the function will sleep unconditionally, but that the operation may require an invoking thread that would have to suspend, wait, or invoke [k\\_yield\(\)](#) before it can complete its operation. This behavior may be mediated by **no-wait**.

Functions that are **sleep** are implicitly **reschedule**.

Functions that are **sleep** may be invoked from thread context.

Functions that are **sleep** may be invoked from interrupt and pre-kernel contexts if and only if invoked in **no-wait** mode.

### no-wait

The no-wait attribute is used on a function that is also **sleep** to indicate that a parameter to the function can force an execution path that will not cause the invoking thread to sleep.

**Explanation** The paradigmatic case of a no-wait function is a function that takes a timeout, to which [K\\_NO\\_WAIT](#) can be passed. The semantics of this special timeout value are to execute the function's operation as long as it can be completed immediately, and to return an error code rather than sleep if it cannot.

It is use of the no-wait feature that allows functions like [k\\_sem\\_take\(\)](#) to be invoked from ISRs, since it is not permitted to sleep in interrupt context.

A function with a no-wait path does not imply that taking that path guarantees the function is synchronous.

Functions with this attribute may be invoked from interrupt and pre-kernel contexts only when the parameter selects the no-wait path.

### **isr-ok**

The **isr-ok** attribute is used on a function to indicate that it works whether it is being invoked from interrupt or thread context.

**Explanation** Any function that is not **sleep** is inherently **isr-ok**. Functions that are **sleep** are **isr-ok** if the implementation ensures that the documented behavior is implemented even if called from an interrupt context. This may be achieved by having the implementation detect the calling context and transfer the operation that would sleep to a thread, or by documenting that when invoked from a non-thread context the function will return a specific error (generally `-EWOULDBLOCK`).

Note that a function that is **no-wait** is safe to call from interrupt context only when the no-wait path is selected. **isr-ok** functions need not provide a no-wait path.

### **pre-kernel-ok**

The **pre-kernel-ok** attribute is used on a function to indicate that it works as documented even when invoked before the kernel main thread has been started.

**Explanation** This attribute is similar to **isr-ok** in function, but is intended for use by any API that is expected to be called in `DEVICE_DEFINE()` or `SYS_INIT()` calls that may be invoked with `PRE_KERNEL_1` or `PRE_KERNEL_2` initialization levels.

Generally a function that is **pre-kernel-ok** checks `k_is_pre_kernel()` when determining whether it can fulfill its required behavior. In many cases it would also check `k_is_in_isr()` so it can be **isr-ok** as well.

### **async**

A function is **async** (i.e. asynchronous) if it may return before the operation it initiates has completed. An asynchronous function will generally provide a mechanism by which operation completion is reported, e.g. a callback or event.

A function that is not asynchronous is synchronous, i.e. the operation will always be complete when the function returns. As most functions are synchronous this behavior does not have a distinct attribute to identify it.

**Explanation** Be aware that **async** is orthogonal to context-switching. Some APIs may provide completion information through a callback, but may suspend while waiting for the resource necessary to initiate the operation; an example is `spi_transceive_async()`.

If a function is both **no-wait** and **async** then selecting the no-wait path only guarantees that the function will not sleep. It does not affect whether the operation will be completed before the function returns.

### **supervisor**

The supervisor attribute is relevant only in user-mode applications, and indicates that the function cannot be invoked from user mode.

## 7.2 Audio

### 7.2.1 Audio Codec

#### Overview

The Audio Codec API provides access to digital audio codecs.

#### Configuration Options

Related configuration options:

- `:kconfig: `CONFIG_AUDIO_CODEC``

#### API Reference

*group* `audio_codec_interface`  
Abstraction for audio codecs.

#### Enums

```
enum audio_pcm_rate_t
    PCM audio sample rates
    Values:

    enumerator AUDIO_PCM_RATE_8K = 8000

    enumerator AUDIO_PCM_RATE_16K = 16000

    enumerator AUDIO_PCM_RATE_24K = 24000

    enumerator AUDIO_PCM_RATE_32K = 32000

    enumerator AUDIO_PCM_RATE_44P1K = 44100

    enumerator AUDIO_PCM_RATE_48K = 48000

    enumerator AUDIO_PCM_RATE_96K = 96000

    enumerator AUDIO_PCM_RATE_192K = 192000

enum audio_pcm_width_t
    PCM audio sample bit widths
    Values:

    enumerator AUDIO_PCM_WIDTH_16_BITS = 16
```

enumerator AUDIO\_PCM\_WIDTH\_20\_BITS = 20

enumerator AUDIO\_PCM\_WIDTH\_24\_BITS = 24

enumerator AUDIO\_PCM\_WIDTH\_32\_BITS = 32

enum audio\_dai\_type\_t

Digital Audio Interface (DAI) type

*Values:*

enumerator AUDIO\_DAI\_TYPE\_I2S

enumerator AUDIO\_DAI\_TYPE\_INVALID

enum audio\_property\_t

Codec properties that can be set by [audio\\_codec\\_set\\_property\(\)](#)

*Values:*

enumerator AUDIO\_PROPERTY\_OUTPUT\_VOLUME

enumerator AUDIO\_PROPERTY\_OUTPUT\_MUTE

enum audio\_channel\_t

Audio channel identifiers to use in [audio\\_codec\\_set\\_property\(\)](#)

*Values:*

enumerator AUDIO\_CHANNEL\_FRONT\_LEFT

enumerator AUDIO\_CHANNEL\_FRONT\_RIGHT

enumerator AUDIO\_CHANNEL\_LFE

enumerator AUDIO\_CHANNEL\_FRONT\_CENTER

enumerator AUDIO\_CHANNEL\_REAR\_LEFT

enumerator AUDIO\_CHANNEL\_REAR\_RIGHT

enumerator AUDIO\_CHANNEL\_REAR\_CENTER

enumerator AUDIO\_CHANNEL\_SIDE\_LEFT

enumerator AUDIO\_CHANNEL\_SIDE\_RIGHT

enumerator AUDIO\_CHANNEL\_ALL

## Functions

static inline int audio\_codec\_configure(const struct [device](#) \*dev, struct [audio\\_codec\\_cfg](#) \*cfg)

Configure the audio codec.

Configure the audio codec device according to the configuration parameters provided as input

### Parameters

- dev – Pointer to the device structure for codec driver instance.
- cfg – Pointer to the structure containing the codec configuration.

**Returns** 0 on success, negative error code on failure

static inline void audio\_codec\_start\_output(const struct [device](#) \*dev)

Set codec to start output audio playback.

Setup the audio codec device to start the audio playback

### Parameters

- dev – Pointer to the device structure for codec driver instance.

**Returns** none

static inline void audio\_codec\_stop\_output(const struct [device](#) \*dev)

Set codec to stop output audio playback.

Setup the audio codec device to stop the audio playback

### Parameters

- dev – Pointer to the device structure for codec driver instance.

**Returns** none

static inline int audio\_codec\_set\_property(const struct [device](#) \*dev, [audio\\_property\\_t](#) property,  
[audio\\_channel\\_t](#) channel, [audio\\_property\\_value\\_t](#)  
val)

Set a codec property defined by [audio\\_property\\_t](#).

Set a property such as volume level, clock configuration etc.

### Parameters

- dev – Pointer to the device structure for codec driver instance.
- property – The codec property to set
- channel – The audio channel for which the property has to be set
- val – pointer to a property value of type [audio\\_codec\\_property\\_value\\_t](#)

**Returns** 0 on success, negative error code on failure

static inline int audio\_codec\_apply\_properties(const struct [device](#) \*dev)

Atomically apply any cached properties.

Following one or more invocations of [audio\\_codec\\_set\\_property](#), that may have been cached by the driver, [audio\\_codec\\_apply\\_properties](#) can be invoked to apply all the properties as atomic as possible

### Parameters

- dev – Pointer to the device structure for codec driver instance.

**Returns** 0 on success, negative error code on failure

```
union audio_dai_cfg_t
```

```
    #include <codec.h> Digital Audio Interface Configuration Configuration is dependent on DAI  
    type
```

### Public Members

```
struct i2s_config i2s
```

```
struct audio_codec_cfg
```

```
    #include <codec.h> Codec configuration parameters
```

```
union audio_property_value_t
```

```
    #include <codec.h> Codec property values
```

### Public Members

```
int vol
```

```
bool mute
```

## 7.2.2 Audio DMIC

### Overview

The audio DMIC interface provides access to digital microphones.

### Configuration Options

Related configuration options:

- **`:kconfig: CONFIG_AUDIO_DMIC`**

### API Reference

```
group audio_dmic_interface
```

```
    Abstraction for digital microphones.
```

### Enums

```
enum dmic_state
```

```
    DMIC driver states
```

```
    Values:
```

```
    enumerator DMIC_STATE_UNINIT
```

enumerator DMIC\_STATE\_INITIALIZED

enumerator DMIC\_STATE\_CONFIGURED

enumerator DMIC\_STATE\_ACTIVE

enumerator DMIC\_STATE\_PAUSED

enum dmic\_trigger

DMIC driver trigger commands

*Values:*

enumerator DMIC\_TRIGGER\_STOP

enumerator DMIC\_TRIGGER\_START

enumerator DMIC\_TRIGGER\_PAUSE

enumerator DMIC\_TRIGGER\_RELEASE

enumerator DMIC\_TRIGGER\_RESET

enum pdm\_lr

PDM Channels LEFT / RIGHT

*Values:*

enumerator PDM\_CHAN\_LEFT

enumerator PDM\_CHAN\_RIGHT

## Functions

static inline uint32\_t dmic\_build\_channel\_map(uint8\_t channel, uint8\_t pdm, enum [pdm\\_lr](#) lr)

Build the channel map to populate struct [pdm\\_chan\\_cfg](#)

Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value

### Parameters

- `channel` – The logical channel number
- `pdm` – The PDM hardware controller number
- `lr` – LEFT/RIGHT channel within the chosen PDM hardware controller

**Returns** Bit-map containing the PDM and L/R channel information

```
static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi,  
                                         uint8_t channel, uint8_t *pdm, enum pdm_lr *lr)
```

Helper function to parse the channel map in *pdm\_chan\_cfg*

Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input

**Parameters**

- `channel_map_lo` – Lower order/significant bits of the channel map
- `channel_map_hi` – Higher order/significant bits of the channel map
- `channel` – The logical channel number
- `pdm` – Pointer to the PDM hardware controller number
- `lr` – Pointer to the LEFT/RIGHT channel within the PDM controller

**Returns** none

```
static inline uint32_t dmic_build_clk_skew_map(uint8_t pdm, uint8_t skew)
```

Build a bit map of clock skew values for each PDM channel

Returns the bit-map of clock skew value shifted to the bit position corresponding to the input PDM controller value

**Parameters**

- `pdm` – The PDM hardware controller number
- `skew` – The skew to apply for the clock output from the PDM controller

**Returns** Bit-map containing the clock skew information

```
static inline int dmic_configure(const struct device *dev, struct dmic_cfg *cfg)
```

Configure the DMIC driver and controller(s)

Configures the DMIC driver device according to the number of channels, channel mapping, PDM I/O configuration, PCM stream configuration, etc.

**Parameters**

- `dev` – Pointer to the device structure for DMIC driver instance
- `cfg` – Pointer to the structure containing the DMIC configuration

**Returns** 0 on success, a negative error code on failure

```
static inline int dmic_trigger(const struct device *dev, enum dmic_trigger cmd)
```

Send a command to the DMIC driver

Sends a command to the driver to perform a specific action

**Parameters**

- `dev` – Pointer to the device structure for DMIC driver instance
- `cmd` – The command to be sent to the driver instance

**Returns** 0 on success, a negative error code on failure

```
static inline int dmic_read(const struct device *dev, uint8_t stream, void **buffer, size_t *size,  
                           int32_t timeout)
```

Read received decimated PCM data stream

Optionally waits for audio to be received and provides the received audio buffer from the requested stream

**Parameters**

- `dev` – Pointer to the device structure for DMIC driver instance

- `stream` – Stream identifier
- `buffer` – Pointer to the received buffer address
- `size` – Pointer to the received buffer size
- `timeout` – Timeout in milliseconds to wait in case audio is not yet received, or `SYS_FOREVER_MS`

**Returns** 0 on success, a negative error code on failure

`struct pdm_io_cfg`

`#include <dmic.h>` PDM Input/Output signal configuration

`struct pcm_stream_cfg`

`#include <dmic.h>` Configuration of the PCM streams to be output by the PDM hardware

`struct pdm_chan_cfg`

`#include <dmic.h>` Mapping/ordering of the PDM channels to logical PCM output channel

`struct dmic_cfg`

`#include <dmic.h>` Input configuration structure for the DMIC configuration API

### 7.2.3 I2S

#### Overview

The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

#### Configuration Options

Related configuration options:

- `:kconfig: `CONFIG_I2S``

#### API Reference

`group i2s_interface`

I2S (Inter-IC Sound) Interface.

The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

#### Defines

`I2S_FMT_DATA_FORMAT_SHIFT`

Data Format bit field position.

`I2S_FMT_DATA_FORMAT_MASK`

Data Format bit field mask.

**I2S\_FMT\_DATA\_FORMAT\_I2S**

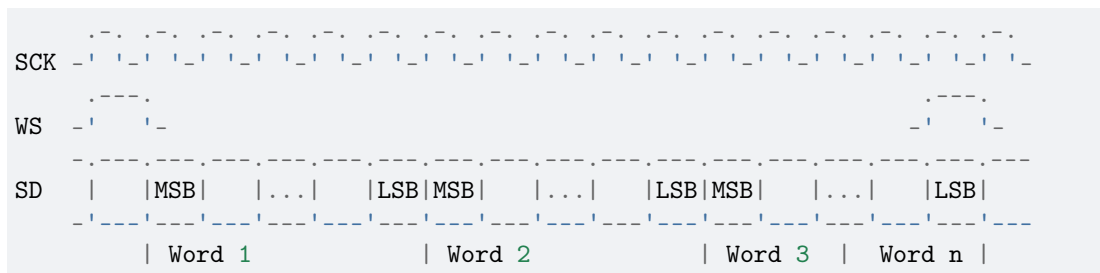

Standard I2S Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.

**I2S\_FMT\_DATA\_FORMAT\_PCM\_SHORT**

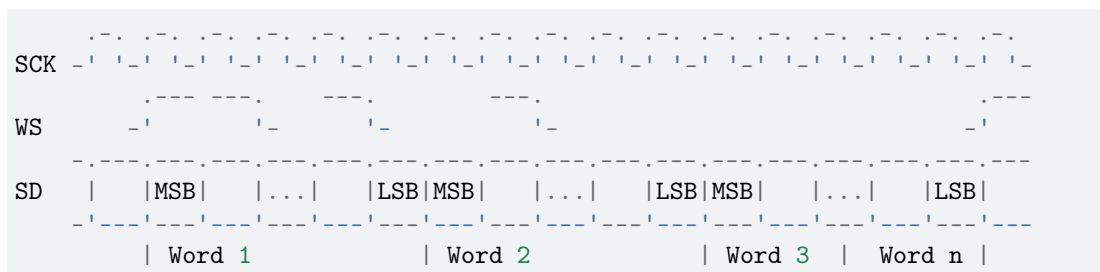

PCM Short Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.

**I2S\_FMT\_DATA\_FORMAT\_PCM\_LONG**

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.

**I2S\_FMT\_DATA\_FORMAT\_LEFT\_JUSTIFIED**

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The

bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

#### I2S\_FMT\_DATA\_FORMAT\_RIGHT\_JUSTIFIED

Right Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

#### I2S\_FMT\_DATA\_ORDER\_MSB

Send MSB first

#### I2S\_FMT\_DATA\_ORDER\_LSB

Send LSB first

#### I2S\_FMT\_DATA\_ORDER\_INV

Invert bit ordering, send LSB first

#### I2S\_FMT\_CLK\_FORMAT\_SHIFT

Data Format bit field position.

#### I2S\_FMT\_CLK\_FORMAT\_MASK

Data Format bit field mask.

#### I2S\_FMT\_BIT\_CLK\_INV

Invert bit clock

#### I2S\_FMT\_FRAME\_CLK\_INV

Invert frame clock

#### I2S\_FMT\_CLK\_NF\_NB

NF represents “Normal Frame” whereas IF represents “Inverted Frame” NB represents “Normal Bit Clk” whereas IB represents “Inverted Bit clk”

I2S\_FMT\_CLK\_NF\_IB

I2S\_FMT\_CLK\_IF\_NB

I2S\_FMT\_CLK\_IF\_IB

I2S\_OPT\_BIT\_CLK\_CONT

Run bit clock continuously

I2S\_OPT\_BIT\_CLK\_GATED

Run bit clock when sending data only

I2S\_OPT\_BIT\_CLK\_MASTER

I2S driver is bit clock master

I2S\_OPT\_BIT\_CLK\_SLAVE

I2S driver is bit clock slave

I2S\_OPT\_FRAME\_CLK\_MASTER

I2S driver is frame clock master

I2S\_OPT\_FRAME\_CLK\_SLAVE

I2S driver is frame clock slave

I2S\_OPT\_LOOPBACK

Loop back mode.

In loop back mode RX input will be connected internally to TX output. This is used primarily for testing.

I2S\_OPT\_PINGPONG

Ping pong mode.

In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer. This is normally used in audio streams when one buffer is being populated while the other is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are used. Static Arrays are used to achieve this and hence they are never freed.

## Typedefs

```
typedef uint8_t i2s_fmt_t
```

```
typedef uint8_t i2s_opt_t
```

## Enums

enum i2s\_dir

I2C Direction.

*Values:*

enumerator I2S\_DIR\_RX

Receive data

enumerator I2S\_DIR\_TX

Transmit data

enumerator I2S\_DIR\_BOTH

Both receive and transmit data

enum i2s\_state

Interface state

*Values:*

enumerator I2S\_STATE\_NOT\_READY

The interface is not ready.

The interface was initialized but **is not** yet ready to receive / transmit data. Call `i2s_configure()` to configure interface **and** change its state to `READY`.

enumerator I2S\_STATE\_READY

The interface is ready to receive / transmit data.

enumerator I2S\_STATE\_RUNNING

The interface is receiving / transmitting data.

enumerator I2S\_STATE\_STOPPING

The interface is draining its transmit queue.

enumerator I2S\_STATE\_ERROR

TX buffer underrun or RX buffer overrun has occurred.

enum i2s\_trigger\_cmd

Trigger command

*Values:*

enumerator I2S\_TRIGGER\_START

Start the transmission / reception of data.

If I2S\_DIR\_TX is set some data has to be queued for transmission by the i2s\_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator I2S\_TRIGGER\_STOP

Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

enumerator I2S\_TRIGGER\_DRAIN

Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as I2S\_TRIGGER\_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.

enumerator I2S\_TRIGGER\_DROP

Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT\_READY and changes the interface state to READY.

enumerator I2S\_TRIGGER\_PREPARE

Prepare the queues after underrun/overflow error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

## Functions

int i2s\_configure(const struct *device* \*dev, enum *i2s\_dir* dir, const struct *i2s\_config* \*cfg)

Configure operation of a host I2S controller.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT\_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame\_clk\_freq set to 0 the interface state will be changed to NOT\_READY.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by `I2S_DIR_*`. The `I2S_DIR_BOTH` value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
- `cfg` – Pointer to the structure containing configuration parameters.

**Return values**

- 0 – If successful.
- `-EINVAL` – Invalid argument.
- `-ENOSYS` – `I2S_DIR_BOTH` value is not supported.

static inline const struct *i2s\_config* \*i2s\_config\_get(const struct *device* \*dev, enum *i2s\_dir* dir)  
Fetch configuration information of a host I2S controller.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance
- `dir` – Stream direction: RX or TX as defined by `I2S_DIR_*`

**Return values** Pointer – to the structure containing configuration parameters, or NULL if un-configured

static inline int i2s\_read(const struct *device* \*dev, void \*\*mem\_block, size\_t \*size)

Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from `rx_mem_slab` (as defined by `i2s_configure`). Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by `i2s_configure`. If the timeout value is set to `K_NO_WAIT` the function is non-blocking.

Reading from the RX queue is possible in any state other than `NOT_READY`. If the interface is in the `ERROR` state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return `-EIO` error.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `mem_block` – Pointer to the RX memory block containing received data.
- `size` – Pointer to the variable storing the number of bytes read.

**Return values**

- 0 – If successful.
- `-EIO` – The interface is in `NOT_READY` or `ERROR` state and there are no more data blocks in the RX queue.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

```
int i2s_buf_read(const struct device *dev, void *buf, size_t *size)
```

Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from `rx_mem_slab` (as defined by `i2s_configure`). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via `i2s_configure()`.

This function is otherwise equivalent to `i2s_read()`.

#### Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `buf` – Destination buffer for read data, which must be at least the as large as the configured memory block size for the RX channel.
- `size` – Pointer to the variable storing the number of bytes read.

#### Return values

- 0 – If successful.
- `-EIO` – The interface is in `NOT_READY` or `ERROR` state and there are no more data blocks in the RX queue.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

```
static inline int i2s_write(const struct device *dev, void *mem_block, size_t size)
```

Write data to the TX queue.

Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of memory blocks preallocated by the user from `tx_mem_slab` (as defined by `i2s_configure`). This function takes ownership of the memory block and will release it when all data are transmitted.

If there are no free slots in the TX queue the function will block waiting for the next TX memory block to be send and removed from the queue. This operation can timeout as defined by `i2s_configure`. If the timeout value is set to `K_NO_WAIT` the function is non-blocking.

Writing to the TX queue is only possible if the interface is in `READY` or `RUNNING` state.

#### Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `mem_block` – Pointer to the TX memory block containing data to be sent.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the memory block.

#### Return values

- 0 – If successful.
- `-EIO` – The interface is not in `READY` or `RUNNING` state.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

```
int i2s_buf_write(const struct device *dev, void *buf, size_t size)
```

Write data to the TX queue from a provided buffer.

This function acquires a memory block from the I2S channel TX queue and copies the provided data buffer into it. It is otherwise equivalent to `i2s_write()`.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `buf` – Pointer to a buffer containing the data to transmit.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the channel's TX memory block configuration.

**Return values**

- 0 – If successful.
- -EIO – The interface is not in READY or RUNNING state.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.
- -ENOMEM – No memory in TX slab queue.
- -EINVAL – Size parameter larger than TX queue memory block.

```
int i2s_trigger(const struct device *dev, enum i2s_dir dir, enum i2s_trigger_cmd cmd)
```

Send a trigger command.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by `I2S_DIR_*`. The `I2S_DIR_BOTH` value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

**Return values**

- 0 – If successful.
- -EINVAL – Invalid argument.
- -EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- -ENOMEM – RX/TX memory block not available.
- -ENOSYS – `I2S_DIR_BOTH` value is not supported.

```
struct i2s_config
```

*#include <i2s.h>* Interface configuration options.

Memory slab pointed to by the `mem_slab` field has to be defined and initialized by the user. For I2S driver to function correctly number of memory blocks in a slab has to be at least 2 per queue. Size of the memory block should be multiple of `frame_size` where `frame_size = (channels * word_size_bytes)`. As an example 16 bit word will occupy 2 bytes, 24 or 32 bit word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.

---

**Remark**

When I2S data format is selected parameter channels is ignored, number of words in a frame is always 2.

---

**Param `word_size`** Number of bits representing one data word.

**Param channels** Number of words per frame.

**Param format** Data stream format as defined by `I2S_FMT_*` constants.

**Param options** Configuration options as defined by `I2S_OPT_*` constants.

**Param frame\_clk\_freq** Frame clock (WS) frequency, this is sampling rate.

**Param mem\_slab** memory slab to store RX/TX data.

**Param block\_size** Size of one RX/TX memory block (buffer) in bytes.

**Param timeout** Read/Write timeout. Number of milliseconds to wait in case TX queue is full or RX queue is empty, or 0, or `SYS_FOREVER_MS`.

## 7.3 Asynchronous Notification APIs

Zephyr APIs often include *async* functions where an operation is initiated and the application needs to be informed when it completes, and whether it succeeded. Using `k_poll()` is often a good method, but some application architectures may be more suited to a callback notification, and operations like enabling clocks and power rails may need to be invoked before kernel functions are available so a busy-wait for completion may be needed.

This API is intended to be embedded within specific subsystems such as *On-Off Manager* and other APIs that support async transactions. The subsystem wrappers are responsible for extracting operation-specific data from requests that include a notification element, and for invoking callbacks with the parameters required by the API.

A limitation is that this API is not suitable for *System Calls* because:

- `sys_notify` is not a kernel object;
- copying the notification content from userspace will break use of `CONTAINER_OF` in the implementing function;
- neither the spin-wait nor callback notification methods can be accepted from userspace callers.

Where a notification is required for an asynchronous operation invoked from a user mode thread the subsystem or driver should provide a syscall API that uses `k_poll_signal` for notification.

### 7.3.1 API Reference

group `sys_notify_apis`

#### Typedefs

```
typedef void (*sys_notify_generic_callback)()
```

Generic signature used to notify of result completion by callback.

Functions with this role may be invoked from any context including pre-kernel, ISR, or cooperative or pre-emptible threads. Compatible functions must be isr-ok and not sleep.

Parameters that should generally be passed to such functions include:

- a pointer to a specific client request structure, i.e. the one that contains the `sys_notify` structure.

- the result of the operation, either as passed to `sys_notify_finalize()` or extracted afterwards using `sys_notify_fetch_result()`. Expected values are service-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed.

## Functions

`static inline uint32_t sys_notify_get_method(const struct sys_notify *notify)`

`int sys_notify_validate(struct sys_notify *notify)`

Validate and initialize the notify structure.

This should be invoked at the start of any service-specific configuration validation. It ensures that the basic asynchronous notification configuration is consistent, and clears the result.

Note that this function does not validate extension bits (zeroed by async notify API init functions like `sys_notify_init_callback()`). It may fail to recognize that an uninitialized structure has been passed because only method bits of flags are tested against method settings. To reduce the chance of accepting an uninitialized operation service validation of structures that contain an *sys\_notify* instance should confirm that the extension bits are set or cleared as expected.

### Return values

- 0 – on successful validation and reinitialization
- -EINVAL – if the configuration is not valid.

`sys_notify_generic_callback sys_notify_finalize(struct sys_notify *notify, int res)`

Record and signal the operation completion.

### Parameters

- *notify* – pointer to the notification state structure.
- *res* – the result of the operation. Expected values are service-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed.

**Returns** If the notification is to be done by callback this returns the generic version of the function to be invoked. The caller must immediately invoke that function with whatever arguments are expected by the callback. If notification is by spinwait or signal, the notification has been completed by the point this function returns, and a null pointer is returned.

`static inline int sys_notify_fetch_result(const struct sys_notify *notify, int *result)`

Check for and read the result of an asynchronous operation.

### Parameters

- *notify* – pointer to the object used to specify asynchronous function behavior and store completion information.
- *result* – pointer to storage for the result of the operation. The result is stored only if the operation has completed.

### Return values

- 0 – if the operation has completed.
- -EAGAIN – if the operation has not completed.

`static inline void sys_notify_init_spinwait(struct sys_notify *notify)`

Initialize a notify object for spinwait notification.

Clients that use this initialization receive no asynchronous notification, and instead must periodically check for completion using `sys_notify_fetch_result()`.

On completion of the operation the client object must be reinitialized before it can be re-used.

#### Parameters

- `notify` – pointer to the notification configuration object.

```
static inline void sys_notify_init_signal(struct sys_notify *notify, struct k_poll_signal *sigp)
```

Initialize a notify object for (k\_poll) signal notification.

Clients that use this initialization will be notified of the completion of operations through the provided signal.

On completion of the operation the client object must be reinitialized before it can be re-used.

---

**Note:** This capability is available only when `:kconfig: `CONFIG_POLL`` is selected.

---

#### Parameters

- `notify` – pointer to the notification configuration object.
- `sigp` – pointer to the signal to use for notification. The value must not be null. The signal must be reset before the client object is passed to the on-off service API.

```
static inline void sys_notify_init_callback(struct sys_notify *notify, sys_notify_generic_callback handler)
```

Initialize a notify object for callback notification.

Clients that use this initialization will be notified of the completion of operations through the provided callback. Note that callbacks may be invoked from various contexts depending on the specific service; see [sys\\_notify\\_generic\\_callback](#).

On completion of the operation the client object must be reinitialized before it can be re-used.

#### Parameters

- `notify` – pointer to the notification configuration object.
- `handler` – a function pointer to use for notification.

```
static inline bool sys_notify_uses_callback(const struct sys_notify *notify)
```

Detect whether a particular notification uses a callback.

The generic handler does not capture the signature expected by the callback, and the translation to a service-specific callback must be provided by the service. This check allows abstracted services to reject callback notification requests when the service doesn't provide a translation function.

**Returns** true if and only if a callback is to be used for notification.

```
struct sys_notify
```

*#include <notify.h>* State associated with notification for an asynchronous operation.

Objects of this type are allocated by a client, which must use an initialization function (e.g. [sys\\_notify\\_init\\_signal\(\)](#)) to configure them. Generally the structure is a member of a service-specific client structure, such as [onoff\\_client](#).

Control of the containing object transfers to the service provider when a pointer to the object is passed to a service function that is documented to take control of the object, such as [onoff\\_service\\_request\(\)](#). While the service provider controls the object the client must not change any object fields. Control reverts to the client:

- if the call to the service API returns an error;

- when operation completion is posted. This may occur before the call to the service API returns.

Operation completion is technically posted when the flags field is updated so that `sys_notify_fetch_result()` returns success. This will happen before the signal is posted or callback is invoked. Note that although the manager will no longer reference the `sys_notify` object past this point, the containing object may have state that will be referenced within the callback. Where callbacks are used control of the containing object does not revert to the client until the callback has been invoked. (Re-use within the callback is explicitly permitted.)

After control has reverted to the client the notify object must be reinitialized for the next operation.

The content of this structure is not public API to clients: all configuration and inspection should be done with functions like `sys_notify_init_callback()` and `sys_notify_fetch_result()`. However, services that use this structure may access certain fields directly.

union method

```
#include <notify.h>
```

### Public Members

```
struct k_poll_signal *signal
```

```
sys_notify_generic_callback callback
```

## 7.4 Bluetooth

### 7.4.1 Connection Management

The Zephyr Bluetooth stack uses an abstraction called `bt_conn` to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the `bt_conn_get_info()` API. Connection objects are reference counted, and the application is expected to use the `bt_conn_ref()` API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the `bt_conn_unref()` API is to be used when releasing a reference to a connection.

An application may track connections by registering a `bt_conn_cb` struct using the `bt_conn_cb_register()` or `cfunc:BT_CONN_CB_DEFINE()` APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the `bt_conn_create_le()` API.

### API Reference

group `bt_conn`

Connection management.

## Defines

`BT_LE_CONN_PARAM_INIT(int_min, int_max, lat, to)`

Initialize connection parameters.

### Parameters

- `int_min` – Minimum Connection Interval ( $N * 1.25$  ms)
- `int_max` – Maximum Connection Interval ( $N * 1.25$  ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout ( $N * 10$  ms)

`BT_LE_CONN_PARAM(int_min, int_max, lat, to)`

Helper to declare connection parameters inline

### Parameters

- `int_min` – Minimum Connection Interval ( $N * 1.25$  ms)
- `int_max` – Maximum Connection Interval ( $N * 1.25$  ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout ( $N * 10$  ms)

`BT_LE_CONN_PARAM_DEFAULT`

Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s

`BT_CONN_LE_PHY_PARAM_INIT(_pref_tx_phy, _pref_rx_phy)`

Initialize PHY parameters

### Parameters

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.

`BT_CONN_LE_PHY_PARAM(_pref_tx_phy, _pref_rx_phy)`

Helper to declare PHY parameters inline

### Parameters

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.

`BT_CONN_LE_PHY_PARAM_1M`

Only LE 1M PHY

`BT_CONN_LE_PHY_PARAM_2M`

Only LE 2M PHY

`BT_CONN_LE_PHY_PARAM_CODED`

Only LE Coded PHY.

`BT_CONN_LE_PHY_PARAM_ALL`

All LE PHYs.

`BT_CONN_LE_DATA_LEN_PARAM_INIT(_tx_max_len, _tx_max_time)`

Initialize transmit data length parameters

**Parameters**

- `_tx_max_len` – Maximum Link Layer transmission payload size in bytes.
- `_tx_max_time` – Maximum Link Layer transmission payload time in us.

`BT_CONN_LE_DATA_LEN_PARAM(_tx_max_len, _tx_max_time)`

Helper to declare transmit data length parameters inline

**Parameters**

- `_tx_max_len` – Maximum Link Layer transmission payload size in bytes.
- `_tx_max_time` – Maximum Link Layer transmission payload time in us.

`BT_LE_DATA_LEN_PARAM_DEFAULT`

Default LE data length parameters.

`BT_LE_DATA_LEN_PARAM_MAX`

Maximum LE data length parameters.

`BT_CONN_ROLE_MASTER`

Connection role (central or peripheral)

`BT_CONN_ROLE_SLAVE`

`BT_CONN_LE_CREATE_PARAM_INIT(_options, _interval, _window)`

Initialize create connection parameters.

**Parameters**

- `_options` – Create connection options.
- `_interval` – Create connection scan interval ( $N * 0.625$  ms).
- `_window` – Create connection scan window ( $N * 0.625$  ms).

`BT_CONN_LE_CREATE_PARAM(_options, _interval, _window)`

Helper to declare create connection parameters inline

**Parameters**

- `_options` – Create connection options.
- `_interval` – Create connection scan interval ( $N * 0.625$  ms).
- `_window` – Create connection scan window ( $N * 0.625$  ms).

`BT_CONN_LE_CREATE_CONN`

Default LE create connection parameters. Scan continuously by setting scan interval equal to scan window.

`BT_CONN_LE_CREATE_CONN_AUTO`

Default LE create connection using filter accept list parameters. Scan window: 30 ms. Scan interval: 60 ms.

`BT_CONN_CB_DEFINE(_name)`

Register a callback structure for connection events.

**Parameters**

- `_name` – Name of callback structure.

`BT_PASSKEY_INVALID`

Special passkey value that can be used to disable a previously set fixed passkey.

`BT_BR_CONN_PARAM_INIT(role_switch)`

Initialize BR/EDR connection parameters.

#### Parameters

- `role_switch` – True if role switch is allowed

`BT_BR_CONN_PARAM(role_switch)`

Helper to declare BR/EDR connection parameters inline

#### Parameters

- `role_switch` – True if role switch is allowed

`BT_BR_CONN_PARAM_DEFAULT`

Default BR/EDR connection parameters: Role switch allowed

## Enums

enum [anonymous]

Connection PHY options

*Values:*

enumerator `BT_CONN_LE_PHY_OPT_NONE` = 0

Convenience value when no options are specified.

enumerator `BT_CONN_LE_PHY_OPT_CODED_S2` = *BIT*(0)

LE Coded using S=2 coding preferred when transmitting.

enumerator `BT_CONN_LE_PHY_OPT_CODED_S8` = *BIT*(1)

LE Coded using S=8 coding preferred when transmitting.

enum [anonymous]

Connection Type

*Values:*

enumerator `BT_CONN_TYPE_LE` = *BIT*(0)

LE Connection Type

enumerator `BT_CONN_TYPE_BR` = *BIT*(1)

BR/EDR Connection Type

enumerator `BT_CONN_TYPE_SCO` = *BIT*(2)

SCO Connection Type

enumerator `BT_CONN_TYPE_ISO` = *BIT*(3)

ISO Connection Type

```
enumerator BT_CONN_TYPE_ALL = BT\_CONN\_TYPE\_LE | BT\_CONN\_TYPE\_BR |  
BT\_CONN\_TYPE\_SCO | BT\_CONN\_TYPE\_ISO
```

All Connection Type

```
enum [anonymous]
```

*Values:*

```
enumerator BT_CONN_ROLE_CENTRAL = 0
```

```
enumerator BT_CONN_ROLE_PERIPHERAL = 1
```

```
enum bt_conn_le_tx_power_phy
```

*Values:*

```
enumerator BT_CONN_LE_TX_POWER_PHY_NONE
```

Convenience macro for when no PHY is set.

```
enumerator BT_CONN_LE_TX_POWER_PHY_1M
```

LE 1M PHY

```
enumerator BT_CONN_LE_TX_POWER_PHY_2M
```

LE 2M PHY

```
enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
```

LE Coded PHY using S=8 coding.

```
enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
```

LE Coded PHY using S=2 coding.

```
enum [anonymous]
```

*Values:*

```
enumerator BT_CONN_LE_OPT_NONE = 0
```

Convenience value when no options are specified.

```
enumerator BT_CONN_LE_OPT_CODED = BIT(0)
```

Enable LE Coded PHY.

```
Enable scanning on the LE Coded PHY.
```

```
enumerator BT_CONN_LE_OPT_NO_1M = BIT(1)
```

Disable LE 1M PHY.

```
Disable scanning on the LE 1M PHY.
```

```
@note Requires @ref BT_CONN_LE_OPT_CODED.
```

enum bt\_security\_t

Security level.

*Values:*

enumerator BT\_SECURITY\_L0

Level 0: Only for BR/EDR special cases, like SDP

enumerator BT\_SECURITY\_L1

Level 1: No encryption and no authentication.

enumerator BT\_SECURITY\_L2

Level 2: Encryption and no authentication (no MITM).

enumerator BT\_SECURITY\_L3

Level 3: Encryption and authentication (MITM).

enumerator BT\_SECURITY\_L4

Level 4: Authenticated Secure Connections and 128-bit key.

enumerator BT\_SECURITY\_FORCE\_PAIR = *BIT*(7)

Bit to force new pairing procedure, bit-wise OR with requested security level.

enum bt\_security\_err

*Values:*

enumerator BT\_SECURITY\_ERR\_SUCCESS

Security procedure successful.

enumerator BT\_SECURITY\_ERR\_AUTH\_FAIL

Authentication failed.

enumerator BT\_SECURITY\_ERR\_PIN\_OR\_KEY\_MISSING

PIN or encryption key is missing.

enumerator BT\_SECURITY\_ERR\_OOB\_NOT\_AVAILABLE

OOB data is not available.

enumerator BT\_SECURITY\_ERR\_AUTH\_REQUIREMENT

The requested security level could not be reached.

enumerator BT\_SECURITY\_ERR\_PAIR\_NOT\_SUPPORTED

Pairing is not supported

enumerator BT\_SECURITY\_ERR\_PAIR\_NOT\_ALLOWED

Pairing is not allowed.

enumerator BT\_SECURITY\_ERR\_INVALID\_PARAM

Invalid parameters.

enumerator `BT_SECURITY_ERR_UNSPECIFIED`

Pairing failed but the exact reason could not be specified.

## Functions

`struct bt_conn *bt_conn_ref(struct bt_conn *conn)`

Increment a connection's reference count.

Increment the reference count of a connection object.

---

**Note:** Will return NULL if the reference count is zero.

---

### Parameters

- `conn` – Connection object.

**Returns** Connection object with incremented reference count, or NULL if the reference count is zero.

`void bt_conn_unref(struct bt_conn *conn)`

Decrement a connection's reference count.

Decrement the reference count of a connection object.

### Parameters

- `conn` – Connection object.

`void bt_conn_foreach(int type, void (*func)(struct bt_conn *conn, void *data), void *data)`

Iterate through all existing connections.

### Parameters

- `type` – Connection Type
- `func` – Function to call for each connection.
- `data` – Data to pass to the callback function.

`struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const bt\_addr\_le\_t *peer)`

Look up an existing connection by address.

Look up an existing connection based on the remote address.

The caller gets a new reference to the connection object which must be released with [bt\\_conn\\_unref\(\)](#) once done using the object.

### Parameters

- `id` – Local identity (in most cases `BT_ID_DEFAULT`).
- `peer` – Remote address.

**Returns** Connection object or NULL if not found.

`const bt\_addr\_le\_t *bt_conn_get_dst(const struct bt_conn *conn)`

Get destination (peer) address of a connection.

### Parameters

- `conn` – Connection object.

**Returns** Destination address.

uint8\_t bt\_conn\_index(struct bt\_conn \*conn)

Get array index of a connection.

This function is used to map bt\_conn to index of an array of connections. The array has CONFIG\_BT\_MAX\_CONN elements.

**Parameters**

- conn – Connection object.

**Returns** Index of the connection object. The range of the returned value is 0..CONFIG\_BT\_MAX\_CONN-1

int bt\_conn\_get\_info(const struct bt\_conn \*conn, struct *bt\_conn\_info* \*info)

Get connection info.

**Parameters**

- conn – Connection object.
- info – Connection info object.

**Returns** Zero on success or (negative) error code on failure.

int bt\_conn\_get\_remote\_info(struct bt\_conn \*conn, struct *bt\_conn\_remote\_info* \*remote\_info)

Get connection info for the remote device.

---

**Note:** In order to retrieve the remote version (version, manufacturer and subversion) **:kconfig: `CONFIG\_BT\_REMOTE\_VERSION`** must be enabled

---

---

**Note:** The remote information is exchanged directly after the connection has been established. The application can be notified about when the remote information is available through the remote\_info\_available callback.

---

**Parameters**

- conn – Connection object.
- remote\_info – Connection remote info object.

**Returns** Zero on success or (negative) error code on failure.

**Returns** -EBUSY The remote information is not yet available.

int bt\_conn\_le\_get\_tx\_power\_level(struct bt\_conn \*conn, struct *bt\_conn\_le\_tx\_power* \*tx\_power\_level)

Get connection transmit power level.

**Parameters**

- conn – Connection object.
- tx\_power\_level – Transmit power level descriptor.

**Returns** Zero on success or (negative) error code on failure.

**Returns** -ENOBUFFS HCI command buffer is not available.

int bt\_conn\_le\_param\_update(struct bt\_conn \*conn, const struct *bt\_le\_conn\_param* \*param)

Update the connection parameters.

If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the **:kconfig: `CONFIG\_BT\_CONN\_PARAM\_UPDATE\_TIMEOUT`** option.

**Parameters**

- `conn` – Connection object.
- `param` – Updated connection parameters.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_conn_le_data_len_update(struct bt_conn *conn, const struct bt\_conn\_le\_data\_len\_param
                             *param)
```

Update the connection transmit data length parameters.

**Parameters**

- `conn` – Connection object.
- `param` – Updated data length parameters.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_conn_le_phy_update(struct bt_conn *conn, const struct bt\_conn\_le\_phy\_param *param)
```

Update the connection PHY parameters.

Update the preferred transmit and receive PHYs of the connection. Use [BT\\_GAP\\_LE\\_PHY\\_NONE](#) to indicate no preference.

**Parameters**

- `conn` – Connection object.
- `param` – Updated connection parameters.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_conn_disconnect(struct bt_conn *conn, uint8_t reason)
```

Disconnect from a remote device or cancel pending connection.

Disconnect an active connection with the specified reason code or cancel pending outgoing connection.

The disconnect reason for a normal disconnect should be: `BT_HCI_ERR_REMOTE_USER_TERM_CONN`.

The following disconnect reasons are accepted:

- `BT_HCI_ERR_AUTH_FAIL`
- `BT_HCI_ERR_REMOTE_USER_TERM_CONN`
- `BT_HCI_ERR_REMOTE_LOW_RESOURCES`
- `BT_HCI_ERR_REMOTE_POWER_OFF`
- `BT_HCI_ERR_UNSUPP_REMOTE_FEATURE`
- `BT_HCI_ERR_PAIRING_NOT_SUPPORTED`
- `BT_HCI_ERR_UNACCEPT_CONN_PARAM`

**Parameters**

- `conn` – Connection to disconnect.
- `reason` – Reason code for the disconnection.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_conn_le_create(const bt\_addr\_le\_t *peer, const struct bt\_conn\_le\_create\_param
                     *create_param, const struct bt\_le\_conn\_param *conn_param, struct
                     bt_conn **conn)
```

Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with [bt\\_conn\\_unref\(\)](#) once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection.

#### Parameters

- `peer` – **[in]** Remote address.
- `create_param` – **[in]** Create connection parameters.
- `conn_param` – **[in]** Initial connection parameters.
- `conn` – **[out]** Valid connection object on success.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_conn_le_create_auto(const struct bt\_conn\_le\_create\_param *create_param, const struct
                          bt\_le\_conn\_param *conn_param)
```

Automatically connect to remote devices in the filter accept list..

This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through [bt\\_conn\\_create\\_auto\\_stop](#). To establish connections to all devices in the the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

#### Parameters

- `create_param` – Create connection parameters
- `conn_param` – Initial connection parameters.

**Returns** Zero on success or (negative) error code on failure.

**Returns** -ENOMEM No free connection object available.

```
int bt_conn_create_auto_stop(void)
```

Stop automatic connect creation.

**Returns** Zero on success or (negative) error code on failure.

```
int bt_le_set_auto_conn(const bt\_addr\_le\_t *addr, const struct bt\_le\_conn\_param *param)
```

Automatically connect to remote device if it's in range.

This function enables/disables automatic connection initiation. Every time the device loses the connection with peer, this connection will be re-established if connectable advertisement from peer is received.

---

**Note:** Auto connect is disabled during explicit scanning.

---

#### Parameters

- `addr` – Remote Bluetooth address.
- `param` – If non-NULL, auto connect is enabled with the given parameters. If NULL, auto connect is disabled.

**Returns** Zero on success or error code otherwise.

```
int bt_conn_set_security(struct bt_conn *conn, bt_security_t sec)
```

Set security level for a connection.

This function enable security (encryption) for a connection. If the device has bond information for the peer with sufficiently strong key encryption will be enabled. If the connection is already encrypted with sufficiently strong key this function does nothing.

If the device has no bond information for the peer and is not already paired then the pairing procedure will be initiated. If the device has bond information or is already paired and the keys are too weak then the pairing procedure will be initiated.

This function may return error if required level of security is not possible to achieve due to local or remote device limitation (e.g., input output capabilities), or if the maximum number of paired devices has been reached.

This function may return error if the pairing procedure has already been initiated by the local device or the peer device.

---

**Note:** When **:kconfig: `CONFIG\_BT\_SMP\_SC\_ONLY`** is enabled then the security level will always be level 4.

---

---

**Note:** When **:kconfig: `CONFIG\_BT\_SMP\_OOB\_LEGACY\_PAIR\_ONLY`** is enabled then the security level will always be level 3.

---

#### Parameters

- `conn` – Connection object.
- `sec` – Requested security level.

**Returns** 0 on success or negative error

```
bt_security_t bt_conn_get_security(struct bt_conn *conn)
```

Get security level for a connection.

**Returns** Connection security level

```
uint8_t bt_conn_enc_key_size(struct bt_conn *conn)
```

Get encryption key size.

This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

#### Parameters

- `conn` – Existing connection object.

**Returns** Encryption key size.

```
void bt_conn_cb_register(struct bt_conn_cb *cb)
```

Register connection callbacks.

Register callbacks to monitor the state of connections.

#### Parameters

- `cb` – Callback struct. Must point to memory that remains valid.

```
void bt_set_bondable(bool enable)
```

Enable/disable bonding.

Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT\_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn't be needed.

**Parameters**

- `enable` – Value allowing/disallowing to be bondable.

`void bt_set_oob_data_flag(bool enable)`

Allow/disallow remote OOB data to be used for pairing.

Set/clear the OOB data flag for SMP Pairing Request/Response data. The initial value of this flag depends on BT\_OOB\_DATA\_PRESENT Kconfig setting.

**Parameters**

- `enable` – Value allowing/disallowing remote OOB data.

`int bt_le_oob_set_legacy_tk(struct bt_conn *conn, const uint8_t *tk)`

Set OOB Temporary Key to be used for pairing.

This function allows to set OOB data for the LE legacy pairing procedure. The function should only be called in response to the `oob_data_request()` callback provided that the legacy method is user pairing.

**Parameters**

- `conn` – Connection object
- `tk` – Pointer to 16 byte long TK array

**Returns** Zero on success or -EINVAL if NULL

`int bt_le_oob_set_sc_data(struct bt_conn *conn, const struct bt\_le\_oob\_sc\_data *oobd_local, const struct bt\_le\_oob\_sc\_data *oobd_remote)`

Set OOB data during LE Secure Connections (SC) pairing procedure.

This function allows to set OOB data during the LE SC pairing procedure. The function should only be called in response to the `oob_data_request()` callback provided that LE SC method is used for pairing.

The user should submit OOB data according to the information received in the callback. This may yield three different configurations: with only local OOB data present, with only remote OOB data present or with both local and remote OOB data present.

**Parameters**

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not present
- `oobd_remote` – Remote OOB data or NULL if not present

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

`int bt_le_oob_get_sc_data(struct bt_conn *conn, const struct bt\_le\_oob\_sc\_data **oobd_local, const struct bt\_le\_oob\_sc\_data **oobd_remote)`

Get OOB data used for LE Secure Connections (SC) pairing procedure.

This function allows to get OOB data during the LE SC pairing procedure that were set by the [bt\\_le\\_oob\\_set\\_sc\\_data\(\)](#) API.

---

**Note:** The OOB data will only be available as long as the connection object associated with it is valid.

---

**Parameters**

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not set

- `oobd_remote` – Remote OOB data or NULL if not set

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

`int bt_passkey_set(unsigned int passkey)`

Set a fixed passkey to be used for pairing.

This API is only available when the `CONFIG_BT_FIXED_PASSKEY` configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the `pairing_confirm()` callback will be called for all incoming pairings.

**Parameters**

- `passkey` – A valid passkey (0 - 999999) or `BT_PASSKEY_INVALID` to disable a previously set fixed passkey.

**Returns** 0 on success or a negative error code on failure.

`int bt_conn_auth_cb_register(const struct bt\_conn\_auth\_cb *cb)`

Register authentication callbacks.

Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

**Parameters**

- `cb` – Callback struct.

**Returns** Zero on success or negative error code otherwise

`int bt_conn_auth_passkey_entry(struct bt_conn *conn, unsigned int passkey)`

Reply with entered passkey.

This function should be called only after `passkey_entry` callback from [bt\\_conn\\_auth\\_cb](#) structure was called.

**Parameters**

- `conn` – Connection object.
- `passkey` – Entered passkey.

**Returns** Zero on success or negative error code otherwise

`int bt_conn_auth_cancel(struct bt_conn *conn)`

Cancel ongoing authenticated pairing.

This function allows to cancel ongoing authenticated pairing.

**Parameters**

- `conn` – Connection object.

**Returns** Zero on success or negative error code otherwise

`int bt_conn_auth_passkey_confirm(struct bt_conn *conn)`

Reply if passkey was confirmed to match by user.

This function should be called only after `passkey_confirm` callback from [bt\\_conn\\_auth\\_cb](#) structure was called.

**Parameters**

- `conn` – Connection object.

**Returns** Zero on success or negative error code otherwise

```
int bt_conn_auth_pairing_confirm(struct bt_conn *conn)
```

Reply if incoming pairing was confirmed by user.

This function should be called only after pairing\_confirm callback from `bt_conn_auth_cb` structure was called if user confirmed incoming pairing.

**Parameters**

- conn – Connection object.

**Returns** Zero on success or negative error code otherwise

```
int bt_conn_auth_pincode_entry(struct bt_conn *conn, const char *pin)
```

Reply with entered PIN code.

This function should be called only after PIN code callback from `bt_conn_auth_cb` structure was called. It's for legacy 2.0 devices.

**Parameters**

- conn – Connection object.
- pin – Entered PIN code.

**Returns** Zero on success or negative error code otherwise

```
struct bt_conn *bt_conn_create_br(const bt_addr_t *peer, const struct bt_br_conn_param  
                                *param)
```

Initiate an BR/EDR connection to a remote device.

Allows initiate new BR/EDR link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

**Parameters**

- peer – Remote address.
- param – Initial connection parameters.

**Returns** Valid connection object on success or NULL otherwise.

```
struct bt_conn *bt_conn_create_sco(const bt_addr_t *peer)
```

Initiate an SCO connection to a remote device.

Allows initiate new SCO link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

**Parameters**

- peer – Remote address.

**Returns** Valid connection object on success or NULL otherwise.

**Note:** Unused in *bt\_conn\_le\_create\_auto*

---

```
struct bt_conn_cb
```

*#include <conn.h>* Connection callback structure.

This structure is used for tracking the state of a connection. It is registered with the help of the [bt\\_conn\\_cb\\_register\(\)](#) API. It's permissible to register multiple instances of this [bt\\_conn\\_cb](#) type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

## Public Members

```
void (*connected)(struct bt_conn *conn, uint8_t err)
```

A new connection has been established.

This callback notifies the application of a new connection. In case the err parameter is non-zero it means that the connection establishment failed.

err can mean either of the following:

- BT\_HCI\_ERR\_UNKNOWN\_CONN\_ID Creating the connection started by [bt\\_conn\\_le\\_create](#) was canceled either by the user through [bt\\_conn\\_disconnect](#) or by the timeout in the host through [bt\\_conn\\_le\\_create\\_param](#) timeout parameter, which defaults to **:kconfig: CONFIG\_BT\_CREATE\_CONN\_TIMEOUT** seconds.
- BT\_HCI\_ERR\_ADV\_TIMEOUT High duty cycle directed connectable advertiser started by [bt\\_le\\_adv\\_start](#) failed to be connected within the timeout.

---

**Note:** If the connection was established from an advertising set then the advertising set cannot be restarted directly from this callback. Instead use the connected callback of the advertising set.

---

**Param conn** New connection object.

**Param err** HCI error. Zero for success, non-zero otherwise.

```
void (*disconnected)(struct bt_conn *conn, uint8_t reason)
```

A connection has been disconnected.

This callback notifies the application that a connection has been disconnected.

When this callback is called the stack still has one reference to the connection object. If the application in this callback tries to start either a connectable advertiser or create a new connection this might fail because there are no free connection objects available. To avoid this issue it is recommended to either start connectable advertise or create a new connection using [k\\_work\\_submit](#) or increase **:kconfig: CONFIG\_BT\_MAX\_CONN**.

**Param conn** Connection object.

**Param reason** HCI reason for the disconnection.

```
bool (*le_param_req)(struct bt_conn *conn, struct bt_le_conn_param *param)
```

LE connection parameter update request.

This callback notifies the application that a remote device is requesting to update the connection parameters. The application accepts the parameters by returning true, or rejects them by returning false. Before accepting, the application may also adjust the parameters to better suit its needs.

It is recommended for an application to have just one of these callbacks for simplicity. However, if an application registers multiple it needs to manage the potentially different requirements for each callback. Each callback gets the parameters as returned by previous callbacks, i.e. they are not necessarily the same ones as the remote originally sent.

If the application does not have this callback then the default is to accept the parameters.

**Param conn** Connection object.

**Param param** Proposed connection parameters.

**Return** true to accept the parameters, or false to reject them.

```
void (*le_param_updated)(struct bt_conn *conn, uint16_t interval, uint16_t latency,
uint16_t timeout)
```

The parameters for an LE connection have been updated.

This callback notifies the application that the connection parameters for an LE connection have been updated.

**Param conn** Connection object.

**Param interval** Connection interval.

**Param latency** Connection latency.

**Param timeout** Connection supervision timeout.

```
void (*identity_resolved)(struct bt_conn *conn, const bt_addr_le_t *rpa, const
bt_addr_le_t *identity)
```

Remote Identity Address has been resolved.

This callback notifies the application that a remote Identity Address has been resolved

**Param conn** Connection object.

**Param rpa** Resolvable Private Address.

**Param identity** Identity Address.

```
void (*security_changed)(struct bt_conn *conn, bt_security_t level, enum bt_security_err
err)
```

The security level of a connection has changed.

This callback notifies the application that the security of a connection has changed.

The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

**Param conn** Connection object.

**Param level** New security level of the connection.

**Param err** Security error. Zero for success, non-zero otherwise.

```
void (*remote_info_available)(struct bt_conn *conn, struct bt_conn_remote_info
*remote_info)
```

Remote information procedures has completed.

This callback notifies the application that the remote information has been retrieved from the remote peer.

**Param conn** Connection object.

**Param remote\_info** Connection information of remote device.

```
void (*le_phy_updated)(struct bt_conn *conn, struct bt_conn_le_phy_info *param)
```

The PHY of the connection has changed.

This callback notifies the application that the PHY of the connection has changed.

**Param conn** Connection object.

**Param info** Connection LE PHY information.

```
void (*le_data_len_updated)(struct bt_conn *conn, struct bt_conn_le_data_len_info *info)
```

The data length parameters of the connection has changed.

This callback notifies the application that the maximum Link Layer payload length or transmission time has changed.

**Param conn** Connection object.

**Param info** Connection data length information.

```

## Public Members

enum *bt\_security\_err* (\*pairing\_accept)(struct bt\_conn \*conn, const struct *bt\_conn\_pairing\_feat* \*const feat)

Query to proceed incoming pairing or not.

On any incoming pairing req/rsp this callback will be called for the application to decide whether to allow for the pairing to continue.

The pairing info received from the peer is passed to assist making the decision.

As this callback is synchronous the application should return a response value immediately. Otherwise it may affect the timing during pairing. Hence, this information should not be conveyed to the user to take action.

The remaining callbacks are not affected by this, but do notice that other callbacks can be called during the pairing. Eg. if pairing\_confirm is registered both will be called for Just-Works pairings.

This callback may be unregistered in which case pairing continues as if the Kconfig flag was not set.

This callback is not called for BR/EDR Secure Simple Pairing (SSP).

**Param conn** Connection where pairing is initiated.

**Param feat** Pairing req/resp info.

void (\*passkey\_display)(struct bt\_conn \*conn, unsigned int passkey)

Display a passkey to the user.

When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability to display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

**Param conn** Connection where pairing is currently active.

**Param passkey** Passkey to show to the user.

void (\*passkey\_entry)(struct bt\_conn \*conn)

Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that's how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the [bt\\_conn\\_auth\\_passkey\\_entry\(\)](#) API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.

**Param conn** Connection where pairing is currently active.

```
void (*passkey_confirm)(struct bt_conn *conn, unsigned int passkey)
```

Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device.. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the [bt\\_conn\\_auth\\_passkey\\_confirm\(\)](#) API should be called. If the user concluded that the passkey doesn't match the [bt\\_conn\\_auth\\_cancel\(\)](#) API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.

**Param conn** Connection where pairing is currently active.

**Param passkey** Passkey to be confirmed.

```
void (*oob_data_request)(struct bt_conn *conn, struct bt_conn_oob_info *info)
```

Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the [bt\\_le\\_oob\\_set\\_sc\\_data\(\)](#) API.

This callback must be set to non-NULL in order to support OOB pairing.

**Param conn** Connection where pairing is currently active.

**Param info** OOB pairing information.

```
void (*cancel)(struct bt_conn *conn)
```

Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the passkey\_display, passkey\_entry passkey\_confirm or pairing\_confirm callback has been provided.

**Param conn** Connection where pairing is currently active.

```
void (*pairing_confirm)(struct bt_conn *conn)
```

Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the [bt\\_conn\\_auth\\_pairing\\_confirm\(\)](#) API should be called. If the user decides to reject the pairing the [bt\\_conn\\_auth\\_cancel\(\)](#) API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

**Param conn** Connection where pairing is currently active.

```
void (*pincode_entry)(struct bt_conn *conn, bool highsec)
```

Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the *highsec* parameter is set to true the PIN code must be 16 digits long.

Once entered, the PIN code should be given to the stack using the [bt\\_conn\\_auth\\_pincode\\_entry\(\)](#) API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

**Param conn** Connection where pairing is currently active.

**Param highsec** true if 16 digit PIN is required.

```
void (*pairing_complete)(struct bt_conn *conn, bool bonded)
```

notify that pairing procedure was complete.

This callback notifies the application that the pairing procedure has been completed.

**Param conn** Connection object.

**Param bonded** Bond information has been distributed during the pairing procedure.

```
void (*pairing_failed)(struct bt_conn *conn, enum bt_security_err reason)
```

notify that pairing process has failed.

**Param conn** Connection object.

**Param reason** Pairing failed reason

```
void (*bond_deleted)(uint8_t id, const bt_addr_le_t *peer)
```

Notify that bond has been deleted.

This callback notifies the application that the bond information for the remote peer has been deleted

**Param id** Which local identity had the bond.

**Param peer** Remote address.

```
struct bt_br_conn_param
```

*#include <conn.h>* Connection parameters for BR/EDR connections

## 7.4.2 Bluetooth Controller

### API Reference

*group* bt\_ctrl

Bluetooth Controller.

### Functions

```
void bt_ctlr_set_public_addr(const uint8_t *addr)
```

Set public address for controller.

Should be called before [bt\\_enable\(\)](#).

#### Parameters

- `addr` – Public address

### 7.4.3 Cryptography

#### API Reference

*group* `bt_crypto`

Cryptography.

#### Functions

```
int bt_rand(void *buf, size_t len)
```

Generate random data.

A random number generation helper which utilizes the Bluetooth controller's own RNG.

#### Parameters

- `buf` – Buffer to insert the random data
- `len` – Length of random data to generate

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

```
int bt_encrypt_le(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
```

AES encrypt little-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

#### Parameters

- `key` – 128 bit LS byte first key for the encryption of the plaintext
- `plaintext` – 128 bit LS byte first plaintext data block to be encrypted
- `enc_data` – 128 bit LS byte first encrypted data block

**Returns** Zero on success or error code otherwise.

```
int bt_encrypt_be(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
```

AES encrypt big-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

#### Parameters

- `key` – 128 bit MS byte first key for the encryption of the plaintext
- `plaintext` – 128 bit MS byte first plaintext data block to be encrypted
- `enc_data` – 128 bit MS byte first encrypted data block

**Returns** Zero on success or error code otherwise.

```
int bt_ccm_decrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t
len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)
```

Decrypt big-endian data with AES-CCM.

Decrypts and authorizes `enc_data` with AES-CCM, as described in <https://tools.ietf.org/html/rfc3610>.

Assumes that the MIC follows directly after the encrypted data.

#### Parameters

- `key` – 128 bit MS byte first key
- `nonce` – 13 byte MS byte first nonce
- `enc_data` – Encrypted data
- `len` – Length of the encrypted data
- `aad` – Additional input data
- `aad_len` – Additional input data length
- `plaintext` – Plaintext buffer to place result in
- `mic_size` – Size of the trailing MIC (in bytes)

#### Return values

- 0 – Successfully decrypted the data.
- -EINVAL – Invalid parameters.
- -EBADMSG – Authentication failed.

```
int bt_ccm_encrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t
len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)
```

Encrypt big-endian data with AES-CCM.

Encrypts and generates a MIC from `plaintext` with AES-CCM, as described in <https://tools.ietf.org/html/rfc3610>.

Places the MIC directly after the encrypted data.

#### Parameters

- `key` – 128 bit MS byte first key
- `nonce` – 13 byte MS byte first nonce
- `plaintext` – Plaintext buffer to encrypt
- `len` – Length of the encrypted data
- `aad` – Additional input data
- `aad_len` – Additional input data length
- `enc_data` – Buffer to place encrypted data in
- `mic_size` – Size of the trailing MIC (in bytes)

#### Return values

- 0 – Successfully encrypted the data.
- -EINVAL – Invalid parameters.

## 7.4.4 Data Buffers

### API Reference

*group* `bt_buf`

Data buffers.

#### Defines

`BT_BUF_RESERVE`

`BT_BUF_SIZE(size)`

Helper to include reserved HCI data in buffer calculations

`BT_BUF_ACL_SIZE(size)`

Helper to calculate needed buffer size for HCI ACL packets

`BT_BUF_EVT_SIZE(size)`

Helper to calculate needed buffer size for HCI Event packets.

`BT_BUF_CMD_SIZE(size)`

Helper to calculate needed buffer size for HCI Command packets.

`BT_BUF_ACL_RX_SIZE`

Data size needed for HCI ACL RX buffers

`BT_BUF_EVT_RX_SIZE`

Data size needed for HCI Event RX buffers

`BT_BUF_RX_SIZE`

Data size needed for HCI ACL or Event RX buffers

`BT_BUF_CMD_TX_SIZE`

Data size needed for HCI Command buffers.

#### Enums

*enum* `bt_buf_type`

Possible types of buffers passed around the Bluetooth stack

*Values:*

enumerator `BT_BUF_CMD`

HCI command

enumerator `BT_BUF_EVT`

HCI event

enumerator `BT_BUF_ACL_OUT`

Outgoing ACL data

enumerator BT\_BUF\_ACL\_IN

Incoming ACL data

enumerator BT\_BUF\_ISO\_OUT

Outgoing ISO data

enumerator BT\_BUF\_ISO\_IN

Incoming ISO data

enumerator BT\_BUF\_H4

H:4 data

## Functions

struct *net\_buf* \*bt\_buf\_get\_rx(enum *bt\_buf\_type* type, *k\_timeout\_t* timeout)

Allocate a buffer for incoming data

This will set the buffer type so *bt\_buf\_set\_type()* does not need to be explicitly called before *bt\_rcv\_prio()*.

### Parameters

- type – Type of buffer. Only BT\_BUF\_EVT and BT\_BUF\_ACL\_IN are allowed.
- timeout – Non-negative waiting period to obtain a buffer or one of the special values K\_NO\_WAIT and K\_FOREVER.

**Returns** A new buffer.

struct *net\_buf* \*bt\_buf\_get\_tx(enum *bt\_buf\_type* type, *k\_timeout\_t* timeout, const void \*data, size\_t size)

Allocate a buffer for outgoing data

This will set the buffer type so *bt\_buf\_set\_type()* does not need to be explicitly called before *bt\_send()*.

### Parameters

- type – Type of buffer. Only BT\_BUF\_CMD, BT\_BUF\_ACL\_OUT or BT\_BUF\_H4, when operating on H:4 mode, are allowed.
- timeout – Non-negative waiting period to obtain a buffer or one of the special values K\_NO\_WAIT and K\_FOREVER.
- data – Initial data to append to buffer.
- size – Initial data size.

**Returns** A new buffer.

struct *net\_buf* \*bt\_buf\_get\_cmd\_complete(*k\_timeout\_t* timeout)

Allocate a buffer for an HCI Command Complete/Status Event

This will set the buffer type so *bt\_buf\_set\_type()* does not need to be explicitly called before *bt\_rcv\_prio()*.

### Parameters

- timeout – Non-negative waiting period to obtain a buffer or one of the special values K\_NO\_WAIT and K\_FOREVER.

**Returns** A new buffer.

```
struct net_buf *bt_buf_get_evt(uint8_t evt, bool discardable, k_timeout_t timeout)
```

Allocate a buffer for an HCI Event

This will set the buffer type so *bt\_buf\_set\_type()* does not need to be explicitly called before *bt\_rcv\_prio()* or *bt\_rcv()*.

#### Parameters

- *evt* – HCI event code
- *discardable* – Whether the driver considers the event discardable.
- *timeout* – Non-negative waiting period to obtain a buffer or one of the special values *K\_NO\_WAIT* and *K\_FOREVER*.

**Returns** A new buffer.

```
static inline void bt_buf_set_type(struct net_buf *buf, enum bt_buf_type type)
```

Set the buffer type

#### Parameters

- *buf* – Bluetooth buffer
- *type* – The *BT\_\** type to set the buffer to

```
static inline enum bt_buf_type bt_buf_get_type(struct net_buf *buf)
```

Get the buffer type

#### Parameters

- *buf* – Bluetooth buffer

**Returns** The *BT\_\** type to of the buffer

```
struct bt_buf_data
```

*#include <buf.h>* This is a base type for *bt\_buf* user data.

## 7.4.5 Generic Access Profile (GAP)

### API Reference

```
group bt_gap
```

Generic Access Profile.

#### Defines

```
BT_ID_DEFAULT
```

Convenience macro for specifying the default identity. This helps make the code more readable, especially when only one identity is supported.

```
BT_DATA(_type, _data, _data_len)
```

Helper to declare elements of *bt\_data* arrays.

This macro is mainly for creating an array of struct *bt\_data* elements which is then passed to e.g. *bt\_le\_adv\_start()*.

#### Parameters

- *\_type* – Type of advertising data field
- *\_data* – Pointer to the data field payload

- `_data_len` – Number of bytes behind the `_data` pointer

`BT_DATA_BYTES(_type, _bytes...)`

Helper to declare elements of `bt_data` arrays.

This macro is mainly for creating an array of struct `bt_data` elements which is then passed to e.g. `bt_le_adv_start()`.

#### Parameters

- `_type` – Type of advertising data field
- `_bytes` – Variable number of single-byte parameters

`BT_LE_ADV_PARAM_INIT(_options, _int_min, _int_max, _peer)`

Initialize advertising parameters.

#### Parameters

- `_options` – Advertising Options
- `_int_min` – Minimum advertising interval
- `_int_max` – Maximum advertising interval
- `_peer` – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

`BT_LE_ADV_PARAM(_options, _int_min, _int_max, _peer)`

Helper to declare advertising parameters inline.

#### Parameters

- `_options` – Advertising Options
- `_int_min` – Minimum advertising interval
- `_int_max` – Maximum advertising interval
- `_peer` – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

`BT_LE_ADV_CONN_DIR(_peer)`

`BT_LE_ADV_CONN`

`BT_LE_ADV_CONN_NAME`

`BT_LE_ADV_CONN_NAME_AD`

`BT_LE_ADV_CONN_DIR_LOW_DUTY(_peer)`

`BT_LE_ADV_NCONN`

Non-connectable advertising with private address

`BT_LE_ADV_NCONN_NAME`

Non-connectable advertising with `BT_LE_ADV_OPT_USE_NAME`

`BT_LE_ADV_NCONN_IDENTITY`

Non-connectable advertising with `BT_LE_ADV_OPT_USE_IDENTITY`

`BT_LE_EXT_ADV_CONN_NAME`

Connectable extended advertising with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_NAME\*](#)

`BT_LE_EXT_ADV_SCAN_NAME`

Scannable extended advertising with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_NAME\*](#)

`BT_LE_EXT_ADV_NCONN`

Non-connectable extended advertising with private address

`BT_LE_EXT_ADV_NCONN_NAME`

Non-connectable extended advertising with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_NAME\*](#)

`BT_LE_EXT_ADV_NCONN_IDENTITY`

Non-connectable extended advertising with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_IDENTITY\*](#)

`BT_LE_EXT_ADV_CODED_NCONN`

Non-connectable extended advertising on coded PHY with private address

`BT_LE_EXT_ADV_CODED_NCONN_NAME`

Non-connectable extended advertising on coded PHY with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_NAME\*](#)

`BT_LE_EXT_ADV_CODED_NCONN_IDENTITY`

Non-connectable extended advertising on coded PHY with [\*BT\\_LE\\_ADV\\_OPT\\_USE\\_IDENTITY\*](#)

`BT_LE_EXT_ADV_START_PARAM_INIT(_timeout, _n_evts)`

Helper to initialize extended advertising start parameters inline

**Parameters**

- `_timeout` – Advertiser timeout
- `_n_evts` – Number of advertising events

`BT_LE_EXT_ADV_START_PARAM(_timeout, _n_evts)`

Helper to declare extended advertising start parameters inline

**Parameters**

- `_timeout` – Advertiser timeout
- `_n_evts` – Number of advertising events

`BT_LE_EXT_ADV_START_DEFAULT`

`BT_LE_PER_ADV_PARAM_INIT(_int_min, _int_max, _options)`

Helper to declare periodic advertising parameters inline

**Parameters**

- `_int_min` – Minimum periodic advertising interval
- `_int_max` – Maximum periodic advertising interval
- `_options` – Periodic advertising properties bitfield.

`BT_LE_PER_ADV_PARAM(_int_min, _int_max, _options)`

Helper to declare periodic advertising parameters inline

**Parameters**

- `_int_min` – Minimum periodic advertising interval
- `_int_max` – Maximum periodic advertising interval
- `_options` – Periodic advertising properties bitfield.

`BT_LE_PER_ADV_DEFAULT`

`BT_LE_SCAN_OPT_FILTER_WHITELIST`

`BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)`

Initialize scan parameters.

**Parameters**

- `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
- `_options` – Scan options
- `_interval` – Scan Interval (N \* 0.625 ms)
- `_window` – Scan Window (N \* 0.625 ms)

`BT_LE_SCAN_PARAM(_type, _options, _interval, _window)`

Helper to declare scan parameters inline.

**Parameters**

- `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
- `_options` – Scan options
- `_interval` – Scan Interval (N \* 0.625 ms)
- `_window` – Scan Window (N \* 0.625 ms)

`BT_LE_SCAN_ACTIVE`

Helper macro to enable active scanning to discover new devices.

`BT_LE_SCAN_PASSIVE`

Helper macro to enable passive scanning to discover new devices.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

`BT_LE_SCAN_CODED_ACTIVE`

Helper macro to enable active scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

`BT_LE_SCAN_CODED_PASSIVE`

Helper macro to enable passive scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

## Typedefs

```
typedef void (*bt_ready_cb_t)(int err)
```

Callback for notifying that Bluetooth has been enabled.

**Param err** zero on success or (negative) error code otherwise.

```
typedef void bt_le_scan_cb_t(const bt_addr_le_t *addr, int8_t rssi, uint8_t adv_type, struct  
                             net_buf_simple *buf)
```

Callback type for reporting LE scan results.

A function of this type is given to the `bt_le_scan_start()` function and will be called for any discovered LE device.

**Param addr** Advertiser LE address and type.

**Param rssi** Strength of advertiser signal.

**Param adv\_type** Type of advertising response from advertiser.

**Param buf** Buffer containing advertiser data.

```
typedef void bt_br_discovery_cb_t(struct bt_br_discovery_result *results, size_t count)
```

Callback type for reporting BR/EDR discovery (inquiry) results.

A callback of this type is given to the `bt_br_discovery_start()` function and will be called at the end of the discovery with information about found devices populated in the results array.

**Param results** Storage used for discovery results

**Param count** Number of valid discovery results.

## Enums

```
enum [anonymous]
```

Advertising options

*Values:*

```
enumerator BT_LE_ADV_OPT_NONE = 0
```

Convenience value when no options are specified.

```
enumerator BT_LE_ADV_OPT_CONNECTABLE = BIT(0)
```

Advertise as connectable.

Advertise as connectable. If not connectable then the type of advertising is determined by providing scan response data. The advertiser address is determined by the type of advertising and/or enabling privacy `:kconfig: `CONFIG_BT_PRIVACY``.

```
enumerator BT_LE_ADV_OPT_ONE_TIME = BIT(1)
```

Advertise one time.

Don't try to resume connectable advertising after a connection. This option is only meaningful when used together with `BT_LE_ADV_OPT_CONNECTABLE`. If set the advertising will be stopped when `bt_le_adv_stop()` is called or when an incoming (peripheral) connection happens. If this option is not set the stack will take care of keeping advertising enabled even as connections occur. If Advertising directed or the advertiser was started with `bt_le_ext_adv_start` then this behavior is the default behavior and this flag has no effect.

enumerator BT\_LE\_ADV\_OPT\_USE\_IDENTITY = *BIT*(2)

Advertise using identity address.

Advertise using the identity address as the advertiser address.

---

**Note:** The address used for advertising will not be the same as returned by *bt\_le\_oob\_get\_local*, instead *bt\_id\_get* should be used to get the LE address.

---

**Warning:** This will compromise the privacy of the device, so care must be taken when using this option.

enumerator BT\_LE\_ADV\_OPT\_USE\_NAME = *BIT*(3)

Advertise using GAP device name.

```

Include the GAP device name automatically when advertising.
By default the GAP device name is put at the end of the scan
response data.
When advertising using @ref BT_LE_ADV_OPT_EXT_ADV and not
@ref BT_LE_ADV_OPT_SCANNABLE then it will be put at the end of the
advertising data.
If the GAP device name does not fit into advertising data it will be
converted to a shortened name if possible.
@ref BT_LE_ADV_OPT_FORCE_NAME_IN_AD can be used to force the device
name to appear in the advertising data of an advert with scan
response data.

The application can set the device name itself by including the
following in the advertising data.
@code
BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
@endcode

```

enumerator BT\_LE\_ADV\_OPT\_DIR\_MODE\_LOW\_DUTY = *BIT*(4)

Low duty cycle directed advertising.

Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator BT\_LE\_ADV\_OPT\_DIR\_ADDR\_RPA = *BIT*(5)

Directed advertising to privacy-enabled peer.

Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator BT\_LE\_ADV\_OPT\_FILTER\_SCAN\_REQ = *BIT*(6)

Use filter accept list to filter devices that can request scan response data.

enumerator BT\_LE\_ADV\_OPT\_FILTER\_CONN = *BIT*(7)

Use filter accept list to filter devices that can connect.

enumerator `BT_LE_ADV_OPT_NOTIFY_SCAN_REQ` = *BIT*(8)

Notify the application when a scan response data has been sent to an active scanner.

enumerator `BT_LE_ADV_OPT_SCANNABLE` = *BIT*(9)

Support scan response data.

When used together with *BT\_LE\_ADV\_OPT\_EXT\_ADV* then this option cannot be used together with the *BT\_LE\_ADV\_OPT\_CONNECTABLE* option. When used together with *BT\_LE\_ADV\_OPT\_EXT\_ADV* then scan response data must be set.

enumerator `BT_LE_ADV_OPT_EXT_ADV` = *BIT*(10)

Advertise with extended advertising.

This options enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.

Without this option the advertiser will send advertising data on the three primary advertising channels.

---

**Note:** Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.

---

enumerator `BT_LE_ADV_OPT_NO_2M` = *BIT*(11)

Disable use of LE 2M PHY on the secondary advertising channel.

Disabling the use of LE 2M PHY could be necessary if scanners don't support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

---

**Note:** Cannot be set if `BT_LE_ADV_OPT_CODED` is set.

---

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_EXT\_ADV*.

---

enumerator `BT_LE_ADV_OPT_CODED` = *BIT*(12)

Advertise on the LE Coded PHY (Long Range).

The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_EXT\_ADV*

---

enumerator `BT_LE_ADV_OPT_ANONYMOUS` = *BIT*(13)

Advertise without a device address (identity or RPA).

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_EXT\_ADV*

---

enumerator BT\_LE\_ADV\_OPT\_USE\_TX\_POWER = *BIT*(14)

Advertise with transmit power.

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_EXT\_ADV*

---

enumerator BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_37 = *BIT*(15)

Disable advertising on channel index 37.

enumerator BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_38 = *BIT*(16)

Disable advertising on channel index 38.

enumerator BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_39 = *BIT*(17)

Disable advertising on channel index 39.

enumerator BT\_LE\_ADV\_OPT\_FORCE\_NAME\_IN\_AD = *BIT*(18)

Put GAP device name into advert data.

Will place the GAP device name into the advertising data rather than the scan response data.

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_USE\_NAME*

---

enum [anonymous]

Periodic Advertising options

*Values:*

enumerator BT\_LE\_PER\_ADV\_OPT\_NONE = 0

Convenience value when no options are specified.

enumerator BT\_LE\_PER\_ADV\_OPT\_USE\_TX\_POWER = *BIT*(1)

Advertise with transmit power.

---

**Note:** Requires *BT\_LE\_ADV\_OPT\_EXT\_ADV*

---

enum [anonymous]

Periodic advertising sync options

*Values:*

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_NONE = 0

Convenience value when no options are specified.

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_USE\_PER\_ADV\_LIST = *BIT*(0)

Use the periodic advertising list to sync with advertiser.

When this option is set, the address and SID of the parameters are ignored.

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_REPORTING\_INITIALLY\_DISABLED = *BIT*(1)

Disables periodic advertising reports.

No advertisement reports will be handled until enabled.

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_DONT\_SYNC\_AOA = *BIT*(2)

Sync with Angle of Arrival (AoA) constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_DONT\_SYNC\_AOD\_1US = *BIT*(3)

Sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_DONT\_SYNC\_AOD\_2US = *BIT*(4)

Sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_OPT\_SYNC\_ONLY\_CONST\_TONE\_EXT = *BIT*(5)

Do not sync to packets without a constant tone extension

enum [anonymous]

Periodic Advertising Sync Transfer options

*Values:*

enumerator BT\_LE\_PER\_ADV\_SYNC\_TRANSFER\_OPT\_NONE = 0

Convenience value when no options are specified.

enumerator BT\_LE\_PER\_ADV\_SYNC\_TRANSFER\_OPT\_SYNC\_NO\_AOA = *BIT*(0)

No Angle of Arrival (AoA)

Do not sync with Angle of Arrival (AoA) constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_TRANSFER\_OPT\_SYNC\_NO\_AOD\_1US = *BIT*(1)

No Angle of Departure (AoD) 1 us.

Do not sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_TRANSFER\_OPT\_SYNC\_NO\_AOD\_2US = *BIT*(2)

No Angle of Departure (AoD) 2.

Do not sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT\_LE\_PER\_ADV\_SYNC\_TRANSFER\_OPT\_SYNC\_ONLY\_CTE = *BIT*(3)

Only sync to packets with constant tone extension

enum [anonymous]

*Values:*

enumerator BT\_LE\_SCAN\_OPT\_NONE = 0

Convenience value when no options are specified.

enumerator BT\_LE\_SCAN\_OPT\_FILTER\_DUPLICATE = *BIT*(0)

Filter duplicates.

enumerator BT\_LE\_SCAN\_OPT\_FILTER\_ACCEPT\_LIST = *BIT*(1)

Filter using filter accept list.

enumerator BT\_LE\_SCAN\_OPT\_CODED = *BIT*(2)

Enable scan on coded PHY (Long Range).

enumerator BT\_LE\_SCAN\_OPT\_NO\_1M = *BIT*(3)

Disable scan on 1M phy.

---

**Note:** Requires *BT\_LE\_SCAN\_OPT\_CODED*.

---

enum [anonymous]

*Values:*

enumerator BT\_LE\_SCAN\_TYPE\_PASSIVE = 0x00

Scan without requesting additional information from advertisers.

enumerator BT\_LE\_SCAN\_TYPE\_ACTIVE = 0x01

Scan and request additional information from advertisers.

## Functions

int bt\_enable(*bt\_ready\_cb\_t* cb)

Enable Bluetooth.

Enable Bluetooth. Must be called before any calls that require communication with the local Bluetooth hardware.

When **:kconfig: 'CONFIG\_BT\_SETTINGS'** has been enabled and the application is not managing identities of the stack itself then the application must call *settings\_load()* before the stack is fully enabled. See *bt\_id\_create()* for more information.

### Parameters

- cb – Callback to notify completion or NULL to perform the enabling synchronously.

**Returns** Zero on success or (negative) error code otherwise.

int bt\_set\_name(const char \*name)

Set Bluetooth Device Name.

Set Bluetooth GAP Device Name.

When advertising with device name in the advertising data the name should be updated by calling *bt\_le\_adv\_update\_data* or *bt\_le\_ext\_adv\_set\_data*.

### Parameters

- name – New name

**Returns** Zero on success or (negative) error code otherwise.

const char \*bt\_get\_name(void)

Get Bluetooth Device Name.

Get Bluetooth GAP Device Name.

**Returns** Bluetooth Device Name

```
void bt_id_get(bt_addr_le_t *addrs, size_t *count)
```

Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all available identities can be retrieved, the number of elements in the *addrs* array should be `CONFIG_BT_ID_MAX`. The identity identifier that some APIs expect (such as advertising parameters) is simply the index of the identity in the *addrs* array.

If *addrs* is passed as `NULL`, then returned *count* contains the count of all available identities that can be retrieved with a subsequent call to this function with non-`NULL` *addrs* parameter.

---

**Note:** Deleted identities may show up as `BT_LE_ADDR_ANY` in the returned array.

---

**Parameters**

- *addrs* – Array where to store the configured identities.
- *count* – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

```
int bt_id_create(bt_addr_le_t *addr, uint8_t *irk)
```

Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling `bt_enable()`, in which case it can be used to override the controller's public address (in case it has one). However, the new identity will only be stored persistently in flash when this API is used after `bt_enable()`. The reason is that the persistent settings are loaded after `bt_enable()` and would therefore cause potential conflicts with the stack blindly overwriting what's stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before `bt_enable()`.

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using `bt_enable()`), then call `settings_load()`, and after that check with `bt_id_get()` how many identities were recovered. If an insufficient amount of identities were recovered the app may then call `bt_id_create()` to create new ones.

**Parameters**

- *addr* – Address to use for the new identity. If `NULL` or initialized to `BT_ADDR_LE_ANY` the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-`NULL`).
- *irk* – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or `NULL`, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-`NULL`). If privacy `:kconfig: `CONFIG_BT_PRIVACY`` is not enabled this parameter must be `NULL`.

**Returns** Identity identifier ( $\geq 0$ ) in case of success, or a negative error code on failure.

```
int bt_id_reset(uint8_t id, bt\_addr\_le\_t *addr, uint8_t *irk)
```

Reset/reclaim an identity for reuse.

The semantics of the *addr* and *irk* parameters of this function are the same as with [bt\\_id\\_create\(\)](#). The difference is the first *id* parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the *addr* and *irk* parameters.

---

**Note:** the default identity (BT\_ID\_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

---

#### Parameters

- *id* – Existing identity identifier.
- *addr* – Address to use for the new identity. If NULL or initialized to BT\_ADDR\_LE\_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- *irk* – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy **:kconfig: `CONFIG\_BT\_PRIVACY`** is not enabled this parameter must be NULL.

**Returns** Identity identifier ( $\geq 0$ ) in case of success, or a negative error code on failure.

```
int bt_id_delete(uint8_t id)
```

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag it as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the [bt\\_id\\_reset\(\)](#) API needs to be used.

---

**Note:** the default identity (BT\_ID\_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

---

#### Parameters

- *id* – Existing identity identifier.

**Returns** 0 in case of success, or a negative error code on failure.

```
int bt_le_adv_start(const struct bt\_le\_adv\_param *param, const struct bt\_data *ad, size_t  
ad_len, const struct bt\_data *sd, size_t sd_len)
```

Start advertising.

Set advertisement data, scan response data, advertisement parameters and start advertising.

When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be [BT\\_GAP\\_ADV\\_HIGH\\_DUTY\\_CYCLE\\_MAX\\_TIMEOUT](#).

#### Parameters

- param – Advertising parameters.
- ad – Data to be used in advertisement packets.
- ad\_len – Number of elements in ad
- sd – Data to be used in scan response packets.
- sd\_len – Number of elements in sd

**Returns** Zero on success or (negative) error code otherwise.

**Returns** -ENOMEM No free connection objects available for connectable advertiser.

**Returns** -ECONNREFUSED When connectable advertising is requested and there is already maximum number of connections established in the controller. This error code is only guaranteed when using Zephyr controller, for other controllers code returned in this case may be -EIO.

```
int bt_le_adv_update_data(const struct bt\_data *ad, size_t ad_len, const struct bt\_data *sd,
                        size_t sd_len)
```

Update advertising.

Update advertisement and scan response data.

#### Parameters

- ad – Data to be used in advertisement packets.
- ad\_len – Number of elements in ad
- sd – Data to be used in scan response packets.
- sd\_len – Number of elements in sd

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_adv_stop(void)
```

Stop advertising.

Stops ongoing advertising.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_ext_adv_create(const struct bt\_le\_adv\_param *param, const struct bt\_le\_ext\_adv\_cb
                        *cb, struct bt_le_ext_adv **adv)
```

Create advertising set.

Create a new advertising set and set advertising parameters. Advertising parameters can be updated with [bt\\_le\\_ext\\_adv\\_update\\_param](#).

#### Parameters

- param – **[in]** Advertising parameters.
- cb – **[in]** Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
- adv – **[out]** Valid advertising set object on success.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_ext_adv_start(struct bt_le_ext_adv *adv, struct bt\_le\_ext\_adv\_start\_param *param)
```

Start advertising with the given advertising set.

If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

#### Parameters

- `adv` – Advertising set object.
- `param` – Advertise start parameters.

`int bt_le_ext_adv_stop(struct bt_le_ext_adv *adv)`

Stop advertising with the given advertising set.

Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

#### Parameters

- `adv` – Advertising set object.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_ext_adv_set_data(struct bt_le_ext_adv *adv, const struct bt\_data *ad, size_t ad_len, const struct bt\_data *sd, size_t sd_len)`

Set an advertising set's advertising or scan response data.

Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.

When both [BT\\_LE\\_ADV\\_OPT\\_EXT\\_ADV](#) and [BT\\_LE\\_ADV\\_OPT\\_SCANNABLE](#) are enabled then advertising data is ignored. When [BT\\_LE\\_ADV\\_OPT\\_SCANNABLE](#) is not enabled then scan response data is ignored.

If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is [BT\\_GAP\\_ADV\\_MAX\\_ADV\\_DATA\\_LEN](#) bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of [BT\\_GAP\\_ADV\\_MAX\\_EXT\\_ADV\\_DATA\\_LEN](#) bytes.

---

**Note:** Not all scanners support extended data length advertising data.

---

---

**Note:** When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

---

#### Parameters

- `adv` – Advertising set object.
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in `ad`
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in `sd`

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_ext_adv_update_param(struct bt_le_ext_adv *adv, const struct bt\_le\_adv\_param *param)`

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

---

**Note:** When changing the option `BT_LE_ADV_OPT_USE_NAME` then `bt_le_ext_adv_set_data` needs to be called in order to update the advertising data and scan response data.

---

#### Parameters

- `adv` – Advertising set object.
- `param` – Advertising parameters.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_ext_adv_delete(struct bt_le_ext_adv *adv)`

Delete advertising set.

Delete advertising set. This will free up the advertising set and make it possible to create a new advertising set.

**Returns** Zero on success or (negative) error code otherwise.

`uint8_t bt_le_ext_adv_get_index(struct bt_le_ext_adv *adv)`

Get array index of an advertising set.

This function is used to map `bt_adv` to index of an array of advertising sets. The array has `CONFIG_BT_EXT_ADV_MAX_ADV_SET` elements.

#### Parameters

- `adv` – Advertising set.

**Returns** Index of the advertising set object. The range of the returned value is `0..CONFIG_BT_EXT_ADV_MAX_ADV_SET-1`

`int bt_le_ext_adv_get_info(const struct bt_le_ext_adv *adv, struct bt\_le\_ext\_adv\_info *info)`

Get advertising set info.

#### Parameters

- `adv` – Advertising set object
- `info` – Advertising set info object

**Returns** Zero on success or (negative) error code on failure.

`int bt_le_per_adv_set_param(struct bt_le_ext_adv *adv, const struct bt\_le\_per\_adv\_param *param)`

Set or update the periodic advertising parameters.

The periodic advertising parameters can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

#### Parameters

- `adv` – Advertising set object.
- `param` – Advertising parameters.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_set_data(const struct bt_le_ext_adv *adv, const struct bt\_data *ad, size_t ad_len)`

Set or update the periodic advertising data.

The periodic advertisement data can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

#### Parameters

- `adv` – Advertising set object.
- `ad` – Advertising data.
- `ad_len` – Advertising data length.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_start(struct bt_le_ext_adv *adv)
```

Starts periodic advertising.

Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.

Once periodic advertising has been enabled, it will continue advertising until `bt_le_per_adv_stop()` has been called, or if the advertising set is deleted by `bt_le_ext_adv_delete()`. Calling `bt_le_ext_adv_stop()` will not stop the periodic advertising.

#### Parameters

- `adv` – Advertising set object.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_stop(struct bt_le_ext_adv *adv)
```

Stops periodic advertising.

Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

#### Parameters

- `adv` – Advertising set object.

**Returns** Zero on success or (negative) error code otherwise.

```
uint8_t bt_le_per_adv_sync_get_index(struct bt_le_per_adv_sync *per_adv_sync)
```

Get array index of an periodic advertising sync object.

This function is get the index of an array of periodic advertising sync objects. The array has `CONFIG_BT_PER_ADV_SYNC_MAX` elements.

#### Parameters

- `per_adv_sync` – The periodic advertising sync object.

**Returns** Index of the periodic advertising sync object. The range of the returned value is `0..CONFIG_BT_PER_ADV_SYNC_MAX-1`

```
int bt_le_per_adv_sync_get_info(struct bt_le_per_adv_sync *per_adv_sync, struct
                               bt_le_per_adv_sync_info *info)
```

Get periodic adv sync information.

#### Parameters

- `per_adv_sync` – Periodic advertising sync object.
- `info` – Periodic advertising sync info object

**Returns** Zero on success or (negative) error code on failure.

```
struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_addr(const bt_addr_le_t *adv_addr,
                                                           uint8_t sid)
```

Look up an existing periodic advertising sync object by advertiser address.

#### Parameters

- `adv_addr` – Advertiser address.

- `sid` – The advertising set ID.

**Returns** Periodic advertising sync object or NULL if not found.

```
int bt_le_per_adv_sync_create(const struct bt_le_per_adv_sync_param *param, struct
                             bt_le_per_adv_sync **out_sync)
```

Create a periodic advertising sync object.

Create a periodic advertising sync object that can try to synchronize to periodic advertising reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

#### Parameters

- `param` – **[in]** Periodic advertising sync parameters.
- `out_sync` – **[out]** Periodic advertising sync object on.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_sync_delete(struct bt_le_per_adv_sync *per_adv_sync)
Delete periodic advertising sync.
```

Delete the periodic advertising sync object. Can be called regardless of the state of the sync. If the syncing is currently syncing, the syncing is cancelled. If the sync has been established, it is terminated. The periodic advertising sync object will be invalidated afterwards.

If the state of the sync object is syncing, then a new periodic advertising sync object may not be created until the controller has finished canceling this object.

#### Parameters

- `per_adv_sync` – The periodic advertising sync object.

**Returns** Zero on success or (negative) error code otherwise.

```
void bt_le_per_adv_sync_cb_register(struct bt_le_per_adv_sync_cb *cb)
Register periodic advertising sync callbacks.
```

Adds the callback structure to the list of callback structures for periodic advertising syncs.

This callback will be called for all periodic advertising sync activity, such as synced, terminated and when data is received.

#### Parameters

- `cb` – Callback struct. Must point to memory that remains valid.

```
int bt_le_per_adv_sync_recv_enable(struct bt_le_per_adv_sync *per_adv_sync)
Enables receiving periodic advertising reports for a sync.
```

If the sync is already receiving the reports, -EALREADY is returned.

#### Parameters

- `per_adv_sync` – The periodic advertising sync object.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_sync_recv_disable(struct bt_le_per_adv_sync *per_adv_sync)
Disables receiving periodic advertising reports for a sync.
```

If the sync report receiving is already disabled, -EALREADY is returned.

#### Parameters

- `per_adv_sync` – The periodic advertising sync object.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_sync_transfer(const struct bt_le_per_adv_sync *per_adv_sync, const struct
                               bt_conn *conn, uint16_t service_data)
```

Transfer the periodic advertising sync information to a peer device.

This will allow another device to quickly synchronize to the same periodic advertising train that this device is currently synced to.

#### Parameters

- `per_adv_sync` – The periodic advertising sync to transfer.
- `conn` – The peer device that will receive the sync information.
- `service_data` – Application service data provided to the remote host.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_set_info_transfer(const struct bt_le_ext_adv *adv, const struct bt_conn
                                   *conn, uint16_t service_data)
```

Transfer the information about a periodic advertising set.

This will allow another device to quickly synchronize to periodic advertising set from this device.

#### Parameters

- `adv` – The periodic advertising set to transfer info of.
- `conn` – The peer device that will receive the information.
- `service_data` – Application service data provided to the remote host.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_sync_transfer_subscribe(const struct bt_conn *conn, const struct
                                         bt_le_per_adv_sync_transfer_param *param)
```

Subscribe to periodic advertising sync transfers (PASTs).

Sets the parameters and allow other devices to transfer periodic advertising syncs.

#### Parameters

- `conn` – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
- `param` – The periodic advertising sync transfer parameters.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_sync_transfer_unsubscribe(const struct bt_conn *conn)
```

Unsubscribe from periodic advertising sync transfers (PASTs).

Remove the parameters that allow other devices to transfer periodic advertising syncs.

#### Parameters

- `conn` – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_le_per_adv_list_add(const bt_addr_le_t *addr, uint8_t sid)
```

Add a device to the periodic advertising list.

Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

#### Parameters

- `addr` – Bluetooth LE identity address.
- `sid` – The advertising set ID. This value is obtained from the [bt\\_le\\_scan\\_rcv\\_info](#) in the scan callback.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_list_remove(const bt\_addr\_le\_t *addr, uint8_t sid)`

Remove a device from the periodic advertising list.

Removes peer device LE address from the periodic advertising list.

#### Parameters

- `addr` – Bluetooth LE identity address.
- `sid` – The advertising set ID. This value is obtained from the [bt\\_le\\_scan\\_rcv\\_info](#) in the scan callback.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_list_clear(void)`

Clear the periodic advertising list.

Clears the entire periodic advertising list.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_le_scan_start(const struct bt\_le\_scan\_param *param, bt\_le\_scan\_cb\_t cb)`

Start (LE) scanning.

Start LE scanning with given parameters and provide results through the specified callback.

---

**Note:** The LE scanner by default does not use the Identity Address of the local device when **:kconfig: `CONFIG\_BT\_PRIVACY`** is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then **:kconfig: `CONFIG\_BT\_SCAN\_WITH\_IDENTITY`** must be enabled.

---

#### Parameters

- `param` – Scan parameters.
- `cb` – Callback to notify scan results. May be NULL if callback registration through [bt\\_le\\_scan\\_cb\\_register](#) is preferred.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

`int bt_le_scan_stop(void)`

Stop (LE) scanning.

Stops ongoing LE scanning.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

`void bt_le_scan_cb_register(struct bt\_le\_scan\_cb *cb)`

Register scanner packet callbacks.

Adds the callback structure to the list of callback structures that monitors scanner activity.

This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

#### Parameters

- `cb` – Callback struct. Must point to memory that remains valid.

```
void bt_le_scan_cb_unregister(struct bt_le_scan_cb *cb)
```

Unregister scanner packet callbacks.

Remove the callback structure from the list of scanner callbacks.

#### Parameters

- `cb` – Callback struct. Must point to memory that remains valid.

```
int bt_le_filter_accept_list_add(const bt_addr_le_t *addr)
```

Add device (LE) to filter accept list.

Add peer device LE address to the filter accept list.

---

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

---

#### Parameters

- `addr` – Bluetooth LE identity address.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
static inline int bt_le_whitelist_add(const bt_addr_le_t *addr)
```

```
int bt_le_filter_accept_list_remove(const bt_addr_le_t *addr)
```

Remove device (LE) from filter accept list.

Remove peer device LE address from the filter accept list.

---

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

---

#### Parameters

- `addr` – Bluetooth LE identity address.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
static inline int bt_le_whitelist_rem(const bt_addr_le_t *addr)
```

```
int bt_le_filter_accept_list_clear(void)
```

Clear filter accept list.

Clear all devices from the filter accept list.

---

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

---

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
static inline int bt_le_whitelist_clear(void)
```

```
int bt_le_set_chan_map(uint8_t chan_map[5])
```

Set (LE) channel map.

#### Parameters

- `chan_map` – Channel map.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
void bt_data_parse(struct net_buf_simple *ad, bool (*func)(struct bt_data *data, void *user_data), void *user_data)
```

Helper for parsing advertising (or EIR or OOB) data.

A helper for parsing the basic data types used for Extended Inquiry Response (EIR), Advertising Data (AD), and OOB data blocks. The most common scenario is to call this helper on the advertising data received in the callback that was given to `bt_le_scan_start()`.

#### Parameters

- `ad` – Advertising data as given to the `bt_le_scan_cb_t` callback.
- `func` – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.
- `user_data` – User data to be passed to the callback.

```
int bt_le_oob_get_local(uint8_t id, struct bt_le_oob *oob)
```

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy `:kconfig: `CONFIG_BT_PRIVACY`` is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for `:kconfig: `CONFIG_BT_RPA_TIMEOUT`` seconds. This address will be used for advertising started by `bt_le_adv_start`, active scanning and connection creation.

---

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback. In addition when extended advertising `:kconfig: `CONFIG_BT_EXT_ADV`` is not enabled or not supported by the controller:
  - Advertiser is enabled using a Random Static Identity Address for a different local identity.
  - The local identity conflicts with the local identity used by other roles.
- 

#### Parameters

- `id` – **[in]** Local identity, in most cases `BT_ID_DEFAULT`.
- `oob` – **[out]** LE OOB information

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
int bt_le_ext_adv_oob_get_local(struct bt_le_ext_adv *adv, struct bt_le_oob *oob)
```

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy `:kconfig: `CONFIG_BT_PRIVACY`` is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for `:kconfig: `CONFIG_BT_RPA_TIMEOUT`` seconds. This address will be used by the advertising set.

---

**Note:** When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

---

---

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback.
- 

#### Parameters

- `adv` – [in] The advertising set object
- `oob` – [out] LE OOB information

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
int bt_br_discovery_start(const struct bt_br_discovery_param *param, struct  
                        bt_br_discovery_result *results, size_t count, bt_br_discovery_cb_t  
                        cb)
```

Start BR/EDR discovery.

Start BR/EDR discovery (inquiry) and provide results through the specified callback. When `bt_br_discovery_cb_t` is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

#### Parameters

- `param` – Discovery parameters.
- `results` – Storage for discovery results.
- `count` – Number of results in storage. Valid range: 1-255.
- `cb` – Callback to notify discovery results.

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

```
int bt_br_discovery_stop(void)
```

Stop BR/EDR discovery.

Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won't be reported

**Returns** Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```
int bt_br_oob_get_local(struct bt_br_oob *oob)
```

Get BR/EDR local Out Of Band information.

This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

#### Parameters

- `oob` – Out Of Band information

```
int bt_br_set_discoverable(bool enable)
```

Enable/disable set controller in discoverable state.

Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it's mandatory to first be in connectable state.

#### Parameters

- `enable` – Value allowing/disallowing controller to become discoverable.

**Returns** Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

```
int bt_br_set_connectable(bool enable)
```

Enable/disable set controller in connectable state.

Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

#### Parameters

- `enable` – Value allowing/disallowing controller to be connectable.

**Returns** Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

```
int bt_unpair(uint8_t id, const bt_addr_le_t *addr)
```

Clear pairing information.

#### Parameters

- `id` – Local identity (mostly just `BT_ID_DEFAULT`).
- `addr` – Remote address, `NULL` or `BT_ADDR_LE_ANY` to clear all remote devices.

**Returns** 0 on success or negative error value on failure.

```
void bt_foreach_bond(uint8_t id, void (*func)(const struct bt_bond_info *info, void *user_data),  
void *user_data)
```

Iterate through all existing bonds.

#### Parameters

- `id` – Local identity (mostly just `BT_ID_DEFAULT`).
- `func` – Function to call for each bond.
- `user_data` – Data to pass to the callback function.

```
struct bt_le_ext_adv_sent_info
```

*#include <bluetooth.h>*

#### Public Members

```
uint8_t num_sent
```

The number of advertising events completed.

```
struct bt_le_ext_adv_connected_info
```

*#include <bluetooth.h>*

### Public Members

struct bt\_conn \*conn  
Connection object of the new connection

struct bt\_le\_ext\_adv\_scanned\_info  
*#include <bluetooth.h>*

### Public Members

*bt\_addr\_le\_t* \*addr  
Active scanner LE address and type

struct bt\_le\_ext\_adv\_cb  
*#include <bluetooth.h>*

### Public Members

void (\*sent)(struct bt\_le\_ext\_adv \*adv, struct *bt\_le\_ext\_adv\_sent\_info* \*info)

The advertising set has finished sending adv data.

This callback notifies the application that the advertising set has finished sending advertising data. The advertising set can either have been stopped by a timeout or because the specified number of advertising events has been reached.

**Param adv** The advertising set object.

**Param info** Information about the sent event.

void (\*connected)(struct bt\_le\_ext\_adv \*adv, struct *bt\_le\_ext\_adv\_connected\_info* \*info)

The advertising set has accepted a new connection.

This callback notifies the application that the advertising set has accepted a new connection.

**Param adv** The advertising set object.

**Param info** Information about the connected event.

void (\*scanned)(struct bt\_le\_ext\_adv \*adv, struct *bt\_le\_ext\_adv\_scanned\_info* \*info)

The advertising set has sent scan response data.

This callback notifies the application that the advertising set has received a Scan Request packet, and has sent a Scan Response packet.

**Param adv** The advertising set object.

**Param addr** Information about the scanned event.

struct bt\_data  
*#include <bluetooth.h>* Bluetooth data.

Description of different data types that can be encoded into advertising data. Used to form arrays that are passed to the *bt\_le\_adv\_start()* function.

struct bt\_le\_adv\_param  
*#include <bluetooth.h>* LE Advertising Parameters.

## Public Members

`uint8_t id`

Local identity.

---

**Note:** When extended advertising `:kconfig: `CONFIG_BT_EXT_ADV`` is not enabled or not supported by the controller it is not possible to scan and advertise simultaneously using two different random addresses.

---

`uint8_t sid`

Advertising Set Identifier, valid range 0x00 - 0x0f.

---

**Note:** Requires [BT\\_LE\\_ADV\\_OPT\\_EXT\\_ADV](#)

---

`uint8_t secondary_max_skip`

Secondary channel maximum skip count.

Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

---

**Note:** Requires [BT\\_LE\\_ADV\\_OPT\\_EXT\\_ADV](#)

---

`uint32_t options`

Bit-field of advertising options

`uint32_t interval_min`

Minimum Advertising Interval (N \* 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

`uint32_t interval_max`

Maximum Advertising Interval (N \* 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

`const bt\_addr\_le\_t *peer`

Directed advertising to peer.

When this parameter is set the advertiser will send directed advertising to the remote device.

The advertising type will either be high duty cycle, or low duty cycle if the `BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY` option is enabled. When using [BT\\_LE\\_ADV\\_OPT\\_EXT\\_ADV](#) then only low duty cycle is allowed.

In case of connectable high duty cycle if the connection could not be established within the timeout the `connected()` callback will be called with the status set to `BT_HCI_ERR_ADV_TIMEOUT`.

```
struct bt_le_per_adv_param
#include <bluetooth.h>
```

### Public Members

`uint16_t interval_min`  
Minimum Periodic Advertising Interval ( $N * 1.25$  ms)  
Shall be greater or equal to `BT_GAP_PER_ADV_MIN_INTERVAL` and less or equal to `interval_max`.

`uint16_t interval_max`  
Maximum Periodic Advertising Interval ( $N * 1.25$  ms)  
Shall be less or equal to `BT_GAP_PER_ADV_MAX_INTERVAL` and greater or equal to `interval_min`.

`uint32_t options`  
Bit-field of periodic advertising options

```
struct bt_le_ext_adv_start_param
#include <bluetooth.h>
```

### Public Members

`uint16_t timeout`  
Advertiser timeout ( $N * 10$  ms).  
Application will be notified by the advertiser sent callback. Set to zero for no timeout.  
When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of [BT\\_GAP\\_ADV\\_HIGH\\_DUTY\\_CYCLE\\_MAX\\_TIMEOUT](#).  
If privacy `:kconfig: CONFIG_BT_PRIVACY` is enabled then the timeout must be less than `:kconfig: CONFIG_BT_RPA_TIMEOUT`.

`uint8_t num_events`  
Number of advertising events.  
Application will be notified by the advertiser sent callback. Set to zero for no limit.

```
struct bt_le_ext_adv_info
#include <bluetooth.h> Advertising set info structure.
```

### Public Members

`int8_t tx_power`  
Currently selected Transmit Power (dBm).

```
struct bt_le_per_adv_sync_synced_info
#include <bluetooth.h>
```

### Public Members

const *bt\_addr\_le\_t* \*addr

Advertiser LE address and type.

uint8\_t sid

Advertiser SID

uint16\_t interval

Periodic advertising interval ( $N * 1.25$  ms)

uint8\_t phy

Advertiser PHY

bool recv\_enabled

True if receiving periodic advertisements, false otherwise.

uint16\_t service\_data

Service Data provided by the peer when sync is transferred.

Will always be 0 when the sync is locally created.

struct bt\_conn \*conn

Peer that transferred the periodic advertising sync.

Will always be 0 when the sync is locally created.

struct bt\_le\_per\_adv\_sync\_term\_info

*#include <bluetooth.h>*

### Public Members

const *bt\_addr\_le\_t* \*addr

Advertiser LE address and type.

uint8\_t sid

Advertiser SID

struct bt\_le\_per\_adv\_sync\_recv\_info

*#include <bluetooth.h>*

### Public Members

const *bt\_addr\_le\_t* \*addr

Advertiser LE address and type.

uint8\_t sid

Advertiser SID

int8\_t tx\_power

The TX power of the advertisement.

int8\_t rssi

The RSSI of the advertisement excluding any CTE.

uint8\_t cte\_type

The Constant Tone Extension (CTE) of the advertisement (bt\_df\_cte\_type)

struct bt\_le\_per\_adv\_sync\_state\_info

*#include <bluetooth.h>*

### Public Members

bool recv\_enabled

True if receiving periodic advertisements, false otherwise.

struct bt\_le\_per\_adv\_sync\_cb

*#include <bluetooth.h>*

### Public Members

void (\*synced)(struct bt\_le\_per\_adv\_sync \*sync, struct [bt\\_le\\_per\\_adv\\_sync\\_synced\\_info](#) \*info)

The periodic advertising has been successfully synced.

This callback notifies the application that the periodic advertising set has been successfully synced, and will now start to receive periodic advertising reports.

**Param sync** The periodic advertising sync object.

**Param info** Information about the sync event.

void (\*term)(struct bt\_le\_per\_adv\_sync \*sync, const struct [bt\\_le\\_per\\_adv\\_sync\\_term\\_info](#) \*info)

The periodic advertising sync has been terminated.

This callback notifies the application that the periodic advertising sync has been terminated, either by local request, remote request or because due to missing data, e.g. by being out of range or sync.

**Param sync** The periodic advertising sync object.

void (\*recv)(struct bt\_le\_per\_adv\_sync \*sync, const struct [bt\\_le\\_per\\_adv\\_sync\\_recv\\_info](#) \*info, struct [net\\_buf\\_simple](#) \*buf)

Periodic advertising data received.

This callback notifies the application of an periodic advertising report.

**Param sync** The advertising set object.

**Param info** Information about the periodic advertising event.

**Param buf** Buffer containing the periodic advertising data.

void (\*state\_changed)(struct bt\_le\_per\_adv\_sync \*sync, const struct [bt\\_le\\_per\\_adv\\_sync\\_state\\_info](#) \*info)

The periodic advertising sync state has changed.

This callback notifies the application about changes to the sync state. Initialize sync and termination is handled by their individual callbacks, and won't be notified here.

**Param sync** The periodic advertising sync object.

**Param info** Information about the state change.

```
void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)
```

BIGInfo advertising report received.

This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

**Param sync** The advertising set object.

**Param biginfo** The BIGInfo report.

```
void (*cte_report_cb)(struct bt_le_per_adv_sync *sync, struct  
bt_df_per_adv_sync_iq_samples_report const *info)
```

Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

**Param sync** The periodic advertising sync object.

**Param info** Information about the sync event.

```
struct bt_le_per_adv_sync_param
```

```
#include <bluetooth.h>
```

## Public Members

[\*bt\\_addr\\_le\\_t\*](#) addr

Periodic Advertiser Address.

Only valid if not using the periodic advertising list

uint8\_t sid

Advertiser SID.

Only valid if not using the periodic advertising list

uint32\_t options

Bit-field of periodic advertising sync options.

uint16\_t skip

Maximum event skip.

Maximum number of periodic advertising events that can be skipped after a successful receive

uint16\_t timeout

Synchronization timeout ( $N * 10$  ms)

Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

```
struct bt_le_per_adv_sync_info
```

```
#include <bluetooth.h> Advertising set info structure.
```

### Public Members

*bt\_addr\_le\_t* addr

Periodic Advertiser Address

uint8\_t sid

Advertiser SID

uint16\_t interval

Periodic advertising interval ( $N * 1.25$  ms)

uint8\_t phy

Advertiser PHY

struct bt\_le\_per\_adv\_sync\_transfer\_param

*#include <bluetooth.h>*

### Public Members

uint16\_t skip

Maximum event skip.

The number of periodic advertising packets that can be skipped after a successful receive.

uint16\_t timeout

Synchronization timeout ( $N * 10$  ms)

Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

uint32\_t options

Periodic Advertising Sync Transfer options

struct bt\_le\_scan\_param

*#include <bluetooth.h>* LE scan parameters

### Public Members

uint8\_t type

Scan type (BT\_LE\_SCAN\_TYPE\_ACTIVE or BT\_LE\_SCAN\_TYPE\_PASSIVE)

uint32\_t options

Bit-field of scanning options.

uint16\_t interval

Scan interval ( $N * 0.625$  ms)

uint16\_t window

Scan window ( $N * 0.625$  ms)

uint16\_t timeout

Scan timeout (N \* 10 ms)

Application will be notified by the scan timeout callback. Set zero to disable timeout.

uint16\_t interval\_coded

Scan interval LE Coded PHY (N \* 0.625 MS)

Set zero to use same as LE 1M PHY scan interval.

uint16\_t window\_coded

Scan window LE Coded PHY (N \* 0.625 MS)

Set zero to use same as LE 1M PHY scan window.

struct bt\_le\_scan\_recv\_info

*#include <bluetooth.h>* LE advertisement packet information

### Public Members

const *bt\_addr\_le\_t* \*addr

Advertiser LE address and type.

If advertiser is anonymous then this address will be *BT\_ADDR\_LE\_ANY*.

uint8\_t sid

Advertising Set Identifier.

int8\_t rssi

Strength of advertiser signal.

int8\_t tx\_power

Transmit power of the advertiser.

uint8\_t adv\_type

Advertising packet type.

uint16\_t adv\_props

Advertising packet properties.

uint16\_t interval

Periodic advertising interval.

If 0 there is no periodic advertising.

uint8\_t primary\_phy

Primary advertising channel PHY.

uint8\_t secondary\_phy

Secondary advertising channel PHY.

struct bt\_le\_scan\_cb

*#include <bluetooth.h>* Listener context for (LE) scanning.

### Public Members

void (\*recv)(const struct *bt\_le\_scan\_recv\_info* \*info, struct *net\_buf\_simple* \*buf)

Advertisement packet received callback.

**Param info** Advertiser packet information.

**Param buf** Buffer containing advertiser data.

void (\*timeout)(void)

The scanner has stopped scanning after scan timeout.

struct bt\_le\_oob\_sc\_data

*#include <bluetooth.h>* LE Secure Connections pairing Out of Band data.

### Public Members

uint8\_t r[16]

Random Number.

uint8\_t c[16]

Confirm Value.

struct bt\_le\_oob

*#include <bluetooth.h>* LE Out of Band information.

### Public Members

*bt\_addr\_le\_t* addr

LE address. If privacy is enabled this is a Resolvable Private Address.

struct *bt\_le\_oob\_sc\_data* le\_sc\_data

LE Secure Connections pairing Out of Band data.

struct bt\_br\_discovery\_result

*#include <bluetooth.h>* BR/EDR discovery result structure.

### Public Members

*bt\_addr\_t* addr

Remote device address

int8\_t rssi

RSSI from inquiry

uint8\_t cod[3]  
Class of Device

uint8\_t eir[240]  
Extended Inquiry Response

struct bt\_br\_discovery\_param  
*#include <bluetooth.h>* BR/EDR discovery parameters

### Public Members

uint8\_t length  
Maximum length of the discovery in units of 1.28 seconds. Valid range is 0x01 - 0x30.

bool limited  
True if limited discovery procedure is to be used.

struct bt\_br\_oob  
*#include <bluetooth.h>*

### Public Members

*bt\_addr\_t* addr  
BR/EDR address.

struct bt\_bond\_info  
*#include <bluetooth.h>* Information about a bond with a remote device.

### Public Members

*bt\_addr\_le\_t* addr  
Address of the remote device.

group bt\_addr  
Bluetooth device address definitions and utilities.

### Defines

BT\_ADDR\_LE\_PUBLIC

BT\_ADDR\_LE\_RANDOM

BT\_ADDR\_LE\_PUBLIC\_ID

BT\_ADDR\_LE\_RANDOM\_ID

BT\_ADDR\_ANY

Bluetooth device “any” address, not a valid address

BT\_ADDR\_NONE

Bluetooth device “none” address, not a valid address

BT\_ADDR\_LE\_ANY

Bluetooth LE device “any” address, not a valid address

BT\_ADDR\_LE\_NONE

Bluetooth LE device “none” address, not a valid address

BT\_ADDR\_IS\_RPA(a)

Check if a Bluetooth LE random address is resolvable private address.

BT\_ADDR\_IS\_NRPA(a)

Check if a Bluetooth LE random address is a non-resolvable private address.

BT\_ADDR\_IS\_STATIC(a)

Check if a Bluetooth LE random address is a static address.

BT\_ADDR\_SET\_RPA(a)

Set a Bluetooth LE random address as a resolvable private address.

BT\_ADDR\_SET\_NRPA(a)

Set a Bluetooth LE random address as a non-resolvable private address.

BT\_ADDR\_SET\_STATIC(a)

Set a Bluetooth LE random address as a static address.

BT\_ADDR\_STR\_LEN

Recommended length of user string buffer for Bluetooth address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

BT\_ADDR\_LE\_STR\_LEN

Recommended length of user string buffer for Bluetooth LE address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

## Functions

static inline int bt\_addr\_cmp(const *bt\_addr\_t* \*a, const *bt\_addr\_t* \*b)

Compare Bluetooth device addresses.

### Parameters

- a – First Bluetooth device address to compare
- b – Second Bluetooth device address to compare

**Returns** negative value if  $a < b$ , 0 if  $a == b$ , else positive

```
static inline int bt_addr_le_cmp(const bt_addr_le_t *a, const bt_addr_le_t *b)
```

Compare Bluetooth LE device addresses.

**Parameters**

- *a* – First Bluetooth LE device address to compare
- *b* – Second Bluetooth LE device address to compare

**Returns** negative value if  $a < b$ , 0 if  $a == b$ , else positive

```
static inline void bt_addr_copy(bt_addr_t *dst, const bt_addr_t *src)
```

Copy Bluetooth device address.

**Parameters**

- *dst* – Bluetooth device address destination buffer.
- *src* – Bluetooth device address source buffer.

```
static inline void bt_addr_le_copy(bt_addr_le_t *dst, const bt_addr_le_t *src)
```

Copy Bluetooth LE device address.

**Parameters**

- *dst* – Bluetooth LE device address destination buffer.
- *src* – Bluetooth LE device address source buffer.

```
int bt_addr_le_create_nrpa(bt_addr_le_t *addr)
```

Create a Bluetooth LE random non-resolvable private address.

```
int bt_addr_le_create_static(bt_addr_le_t *addr)
```

Create a Bluetooth LE random static address.

```
static inline bool bt_addr_le_is_rpa(const bt_addr_le_t *addr)
```

Check if a Bluetooth LE address is a random private resolvable address.

**Parameters**

- *addr* – Bluetooth LE device address.

**Returns** true if address is a random private resolvable address.

```
static inline bool bt_addr_le_is_identity(const bt_addr_le_t *addr)
```

Check if a Bluetooth LE address is valid identity address.

Valid Bluetooth LE identity addresses are either public address or random static address.

**Parameters**

- *addr* – Bluetooth LE device address.

**Returns** true if address is a valid identity address.

```
static inline int bt_addr_to_str(const bt_addr_t *addr, char *str, size_t len)
```

Converts binary Bluetooth address to string.

**Parameters**

- *addr* – Address of buffer containing binary Bluetooth address.
- *str* – Address of user buffer with enough room to store formatted string containing binary address.
- *len* – Length of data to be copied to user string buffer. Refer to BT\_ADDR\_STR\_LEN about recommended value.

**Returns** Number of successfully formatted bytes from binary address.

```
static inline int bt_addr_le_to_str(const bt_addr_le_t *addr, char *str, size_t len)
```

Converts binary LE Bluetooth address to string.

#### Parameters

- `addr` – Address of buffer containing binary LE Bluetooth address.
- `str` – Address of user buffer with enough room to store formatted string containing binary LE address.
- `len` – Length of data to be copied to user string buffer. Refer to `BT_ADDR_LE_STR_LEN` about recommended value.

**Returns** Number of successfully formatted bytes from binary address.

```
int bt_addr_from_str(const char *str, bt_addr_t *addr)
```

Convert Bluetooth address from string to binary.

#### Parameters

- `str` – **[in]** The string representation of a Bluetooth address.
- `addr` – **[out]** Address of buffer to store the Bluetooth address

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_addr_le_from_str(const char *str, const char *type, bt_addr_le_t *addr)
```

Convert LE Bluetooth address from string to binary.

#### Parameters

- `str` – **[in]** The string representation of an LE Bluetooth address.
- `type` – **[in]** The string representation of the LE Bluetooth address type.
- `addr` – **[out]** Address of buffer to store the LE Bluetooth address

**Returns** Zero on success or (negative) error code otherwise.

```
struct bt_addr_t
```

*#include <addr.h>* Bluetooth Device Address

```
struct bt_addr_le_t
```

*#include <addr.h>* Bluetooth LE Device Address

*Values:*

enumerator BT\_GAP\_LE\_PHY\_NONE = 0

Convenience macro for when no PHY is set.

enumerator BT\_GAP\_LE\_PHY\_1M = *BIT*(0)

LE 1M PHY

enumerator BT\_GAP\_LE\_PHY\_2M = *BIT*(1)

LE 2M PHY

enumerator BT\_GAP\_LE\_PHY\_CODED = *BIT*(2)

LE Coded PHY

enum [anonymous]

Advertising PDU types

*Values:*

enumerator BT\_GAP\_ADV\_TYPE\_ADV\_IND = 0x00

Scannable and connectable advertising.

enumerator BT\_GAP\_ADV\_TYPE\_ADV\_DIRECT\_IND = 0x01

Directed connectable advertising.

enumerator BT\_GAP\_ADV\_TYPE\_ADV\_SCAN\_IND = 0x02

Non-connectable and scannable advertising.

enumerator BT\_GAP\_ADV\_TYPE\_ADV\_NONCONN\_IND = 0x03

Non-connectable and non-scannable advertising.

enumerator BT\_GAP\_ADV\_TYPE\_SCAN\_RSP = 0x04

Additional advertising data requested by an active scanner.

enumerator BT\_GAP\_ADV\_TYPE\_EXT\_ADV = 0x05

Extended advertising, see advertising properties.

enum [anonymous]

Advertising PDU properties

*Values:*

enumerator BT\_GAP\_ADV\_PROP\_CONNECTABLE = *BIT*(0)

Connectable advertising.

enumerator BT\_GAP\_ADV\_PROP\_SCANNABLE = *BIT*(1)

Scannable advertising.

enumerator BT\_GAP\_ADV\_PROP\_DIRECTED = *BIT*(2)

Directed advertising.

enumerator BT\_GAP\_ADV\_PROP\_SCAN\_RESPONSE = *BIT*(3)

Additional advertising data requested by an active scanner.

enumerator BT\_GAP\_ADV\_PROP\_EXT\_ADV = *BIT*(4)

Extended advertising.

enum [anonymous]

Constant Tone Extension (CTE) types

*Values:*

enumerator BT\_GAP\_CTE\_AOA = 0x00

Angle of Arrival

enumerator BT\_GAP\_CTE\_AOD\_1US = 0x01

Angle of Departure with 1 us slots

enumerator BT\_GAP\_CTE\_AOD\_2US = 0x02

Angle of Departure with 2 us slots

enumerator BT\_GAP\_CTE\_NONE = 0xFF

No extensions

enum [anonymous]

Peripheral sleep clock accuracy (SCA) in ppm (parts per million)

*Values:*

enumerator BT\_GAP\_SCA\_UNKNOWN = 0

enumerator BT\_GAP\_SCA\_251\_500 = 0

enumerator BT\_GAP\_SCA\_151\_250 = 1

enumerator BT\_GAP\_SCA\_101\_150 = 2

```
enumerator BT_GAP_SCA_76_100 = 3
```

```
enumerator BT_GAP_SCA_51_75 = 4
```

```
enumerator BT_GAP_SCA_31_50 = 5
```

```
enumerator BT_GAP_SCA_21_30 = 6
```

```
enumerator BT_GAP_SCA_0_20 = 7
```

## 7.4.6 Generic Attribute Profile (GATT)

GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using `bt_gatt_service_register()` API which takes the `bt_gatt_service` struct that provides the list of attributes the service contains. The helper macro `BT_GATT_SERVICE()` can be used to declare a service.

Attributes can be declared using the `bt_gatt_attr` struct or using one of the helper macros:

`BT_GATT_PRIMARY_SERVICE` Declares a Primary Service.

`BT_GATT_SECONDARY_SERVICE` Declares a Secondary Service.

`BT_GATT_INCLUDE_SERVICE` Declares a Include Service.

`BT_GATT_CHARACTERISTIC` Declares a Characteristic.

`BT_GATT_DESCRIPTOR` Declares a Descriptor.

`BT_GATT_ATTRIBUTE` Declares an Attribute.

`BT_GATT_CCC` Declares a Client Characteristic Configuration.

`BT_GATT_CEP` Declares a Characteristic Extended Properties.

`BT_GATT_CUD` Declares a Characteristic User Format.

Each attribute contain a uuid, which describes their type, a read callback, a write callback and a set of permission. Both read and write callbacks can be set to NULL if the attribute permission don't allow their respective operations.

---

**Note:** Attribute read and write callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

---

Attribute value changes can be notified using `bt_gatt_notify()` API, alternatively there is `bt_gatt_notify_cb()` where is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by `bt_gatt_indicate()` API.

Client procedures can be enabled with the configuration option: `:kconfig: `CONFIG_BT_GATT_CLIENT``

Discover procedures can be initiated with the use of `bt_gatt_discover()` API which takes the `bt_gatt_discover_params` struct which describes the type of discovery. The parameters also serves as a filter when setting the uuid field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

---

**Note:** Caching discovered attributes is not supported.

---

Read procedures are supported by `bt_gatt_read()` API which takes the `bt_gatt_read_params` struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: `:kconfig: `CONFIG_BT_GATT_READ_MULTIPLE``

Write procedures are supported by `bt_gatt_write()` API and takes `bt_gatt_write_params` struct as parameters. In case the write operation don't require a response `bt_gatt_write_without_response()` or `bt_gatt_write_without_response_cb()` APIs can be used, with the later working similarly to `bt_gatt_notify_cb()`.

Subscriptions to notification and indication can be initiated with use of `bt_gatt_subscribe()` API which takes `bt_gatt_subscribe_params` as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple notify callback being triggered for the same attribute. Subscriptions can be removed with use of `bt_gatt_unsubscribe()` API.

---

**Note:** When subscriptions are removed notify callback is called with the data set to NULL.

---

## API Reference

group bt\_gatt

Generic Attribute Profile (GATT)

### Defines

BT\_GATT\_ERR(\_att\_err)

Construct error return value for attribute read and write callbacks.

#### Parameters

- `_att_err` – ATT error code

**Returns** Appropriate error code for the attribute callbacks.

BT\_GATT\_CHRC\_BROADCAST

Characteristic broadcast property.

Characteristic Properties Bit field values

If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

BT\_GATT\_CHRC\_READ

Characteristic read property.

If set, permits reads of the Characteristic Value.

BT\_GATT\_CHRC\_WRITE\_WITHOUT\_RESP

Characteristic write without response property.

If set, permits write of the Characteristic Value without response.

BT\_GATT\_CHRC\_WRITE

Characteristic write with response property.

If set, permits write of the Characteristic Value with response.

BT\_GATT\_CHRC\_NOTIFY

Characteristic notify property.

If set, permits notifications of a Characteristic Value without acknowledgment.

BT\_GATT\_CHRC\_INDICATE

Characteristic indicate property.

If set, permits indications of a Characteristic Value with acknowledgment.

BT\_GATT\_CHRC\_AUTH

Characteristic Authenticated Signed Writes property.

If set, permits signed writes to the Characteristic Value.

BT\_GATT\_CHRC\_EXT\_PROP

Characteristic Extended Properties property.

If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

BT\_GATT\_CEP\_RELIABLE\_WRITE

Characteristic Extended Properties Bit field values

BT\_GATT\_CEP\_WRITABLE\_AUX

BT\_GATT\_CCC\_NOTIFY

Client Characteristic Configuration Notification.

Client Characteristic Configuration Values

If set, changes to Characteristic Value shall be notified.

BT\_GATT\_CCC\_INDICATE

Client Characteristic Configuration Indication.

If set, changes to Characteristic Value shall be indicated.

BT\_GATT\_SCC\_BROADCAST

Server Characteristic Configuration Broadcast.

Server Characteristic Configuration Values

If set, the characteristic value shall be broadcast in the advertising data when the server is advertising.

## Enums

enum [anonymous]

GATT attribute permission bit field values

Values:

enumerator BT\_GATT\_PERM\_NONE = 0

No operations supported, e.g. for notify-only

enumerator BT\_GATT\_PERM\_READ = *BIT*(0)

Attribute read permission.

enumerator BT\_GATT\_PERM\_WRITE = *BIT*(1)

Attribute write permission.

enumerator BT\_GATT\_PERM\_READ\_ENCRYPT = *BIT*(2)

Attribute read permission with encryption.

If *set*, requires encryption *for* read access.

enumerator BT\_GATT\_PERM\_WRITE\_ENCRYPT = *BIT*(3)

Attribute write permission with encryption.

If *set*, requires encryption *for* write access.

enumerator BT\_GATT\_PERM\_READ\_AUTHEN = *BIT*(4)

Attribute read permission with authentication.

If *set*, requires encryption using authenticated link-key *for* read access.

enumerator BT\_GATT\_PERM\_WRITE\_AUTHEN = *BIT*(5)

Attribute write permission with authentication.

If *set*, requires encryption using authenticated link-key *for* write access.

enumerator BT\_GATT\_PERM\_PREPARE\_WRITE = *BIT*(6)

Attribute prepare write permission.

If *set*, allows prepare writes *with* use of BT\_GATT\_WRITE\_FLAG\_PREPARE passed to write callback.

enum [anonymous]

GATT attribute write flags

*Values:*

enumerator BT\_GATT\_WRITE\_FLAG\_PREPARE = *BIT*(0)

Attribute prepare write flag.

If `set`, write callback should only check if the device is authorized but no data shall be written.

enumerator `BT_GATT_WRITE_FLAG_CMD` = `BIT(1)`

Attribute write command flag.

If `set`, indicates that write operation is a command (Write without response) which doesn't generate any response.

struct `bt_gatt_attr`

#include <gatt.h> GATT Attribute structure.

## Public Members

const struct `bt_uuid` \*`uuid`

Attribute UUID

`ssize_t (*read)(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)`

Attribute read callback.

The callback can also be used locally to read the contents of the attribute in which case no connection will be set.

**Param conn** The connection that is requesting to read

**Param attr** The attribute that's being read

**Param buf** Buffer to place the read result in

**Param len** Length of data to read

**Param offset** Offset to start reading from

**Return** Number of bytes read, or in case of an error `BT_GATT_ERR()` with a specific ATT error code.

`ssize_t (*write)(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)`

Attribute write callback.

**Param conn** The connection that is requesting to write

**Param attr** The attribute that's being written

**Param buf** Buffer with the data to write

**Param len** Number of bytes in the buffer

**Param offset** Offset to start writing from

**Param flags** Flags (`BT_GATT_WRITE_*`)

**Return** Number of bytes written, or in case of an error `BT_GATT_ERR()` with a specific ATT error code.

void \*`user_data`

Attribute user data

uint16\_t `handle`

Attribute handle

uint8\_t `perm`

Attribute permissions

```
struct bt_gatt_service_static
    #include <gatt.h> GATT Service structure.
```

### Public Members

```
const struct bt_gatt_attr *attrs
    Service Attributes
```

```
size_t attr_count
    Service Attribute count
```

```
struct bt_gatt_service
    #include <gatt.h> GATT Service structure.
```

### Public Members

```
struct bt_gatt_attr *attrs
    Service Attributes
```

```
size_t attr_count
    Service Attribute count
```

```
struct bt_gatt_service_val
    #include <gatt.h> Service Attribute Value.
```

### Public Members

```
const struct bt_uuid *uuid
    Service UUID.
```

```
uint16_t end_handle
    Service end handle.
```

```
struct bt_gatt_include
    #include <gatt.h> Include Attribute Value.
```

### Public Members

```
const struct bt_uuid *uuid
    Service UUID.
```

```
uint16_t start_handle
    Service start handle.
```

uint16\_t end\_handle  
Service end handle.

struct bt\_gatt\_cb  
*#include <gatt.h>* GATT callback structure.

### Public Members

void (\*att\_mtu\_updated)(struct bt\_conn \*conn, uint16\_t tx, uint16\_t rx)  
The maximum ATT MTU on a connection has changed.  
This callback notifies the application that the maximum TX or RX ATT MTU has increased.  
**Param conn** Connection object.  
**Param tx** Updated TX ATT MTU.  
**Param rx** Updated RX ATT MTU.

struct bt\_gatt\_chrc  
*#include <gatt.h>* Characteristic Attribute Value.

### Public Members

const struct *bt\_uuid* \*uuid  
Characteristic UUID.  
  
uint16\_t value\_handle  
Characteristic Value handle.  
  
uint8\_t properties  
Characteristic properties.

struct bt\_gatt\_cep  
*#include <gatt.h>* Characteristic Extended Properties Attribute Value.

### Public Members

uint16\_t properties  
Characteristic Extended properties

struct bt\_gatt\_ccc  
*#include <gatt.h>* Client Characteristic Configuration Attribute Value

### Public Members

uint16\_t flags  
Client Characteristic Configuration flags

```
struct bt_gatt_scc
```

*#include <gatt.h>* Server Characteristic Configuration Attribute Value

### Public Members

```
uint16_t flags
```

Server Characteristic Configuration flags

```
struct bt_gatt_cpf
```

*#include <gatt.h>* GATT Characteristic Presentation Format Attribute Value.

### Public Members

```
uint8_t format
```

Format of the value of the characteristic

```
int8_t exponent
```

Exponent field to determine how the value of this characteristic is further formatted

```
uint16_t unit
```

Unit of the characteristic

```
uint8_t name_space
```

Name space of the description

```
uint16_t description
```

Description of the characteristic as defined in a higher layer profile

## GATT Server

```
group bt_gatt_server
```

### Defines

```
BT_GATT_SERVICE_DEFINE(_name, ...)
```

Statically define and register a service.

Helper macro to statically define and register a service.

#### Parameters

- `_name` – Service name.

```
BT_GATT_SERVICE_INSTANCE_DEFINE(_name, _instances, _instance_num, _attrs_def)
```

Statically define service structure array.

Helper macro to statically define service structure array. Each element of the array is linked to the service attribute array which is also defined in this scope using `_attrs_def` macro.

#### Parameters

- `_name` – Name of service structure array.

- `_instances` – Array of instances to pass as user context to the attribute callbacks.
- `_instance_num` – Number of elements in instance array.
- `_attrs_def` – Macro provided by the user that defines attribute array for the service. This macro should accept single parameter which is the instance context.

`BT_GATT_SERVICE(_attrs)`

Service Structure Declaration Macro.

Helper macro to declare a service structure.

**Parameters**

- `_attrs` – Service attributes.

`BT_GATT_PRIMARY_SERVICE(_service)`

Primary Service Declaration Macro.

Helper macro to declare a primary service attribute.

**Parameters**

- `_service` – Service attribute value.

`BT_GATT_SECONDARY_SERVICE(_service)`

Secondary Service Declaration Macro.

Helper macro to declare a secondary service attribute.

**Parameters**

- `_service` – Service attribute value.

`BT_GATT_INCLUDE_SERVICE(_service_incl)`

Include Service Declaration Macro.

Helper macro to declare database internal include service attribute.

**Parameters**

- `_service_incl` – the first service attribute of service to include

`BT_GATT_CHRC_INIT(_uuid, _handle, _props)`

`BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)`

Characteristic and Value Declaration Macro.

Helper macro to declare a characteristic attribute along with its attribute value.

**Parameters**

- `_uuid` – Characteristic attribute uuid.
- `_props` – Characteristic attribute properties.
- `_perm` – Characteristic Attribute access permissions.
- `_read` – Characteristic Attribute read callback.
- `_write` – Characteristic Attribute write callback.
- `_user_data` – Characteristic Attribute user data.

`BT_GATT_CCC_MAX`

`BT_GATT_CCC_INITIALIZER(_changed, _write, _match)`

Initialize Client Characteristic Configuration Declaration Macro.

Helper macro to initialize a Managed CCC attribute value.

**Parameters**

- `_changed` – Configuration changed callback.
- `_write` – Configuration write callback.
- `_match` – Configuration match callback.

`BT_GATT_CCC_MANAGED(_ccc, _perm)`

Managed Client Characteristic Configuration Declaration Macro.

Helper macro to declare a Managed CCC attribute.

**Parameters**

- `_ccc` – CCC attribute user data, shall point to a `_bt_gatt_ccc`.
- `_perm` – CCC access permissions.

`BT_GATT_CCC(_changed, _perm)`

Client Characteristic Configuration Declaration Macro.

Helper macro to declare a CCC attribute.

**Parameters**

- `_changed` – Configuration changed callback.
- `_perm` – CCC access permissions.

`BT_GATT_CEP(_value)`

Characteristic Extended Properties Declaration Macro.

Helper macro to declare a CEP attribute.

**Parameters**

- `_value` – Pointer to a struct `bt_gatt_cep`.

`BT_GATT_CUD(_value, _perm)`

Characteristic User Format Descriptor Declaration Macro.

Helper macro to declare a CUD attribute.

**Parameters**

- `_value` – User description NULL-terminated C string.
- `_perm` – Descriptor attribute access permissions.

`BT_GATT_CPF(_value)`

Characteristic Presentation Format Descriptor Declaration Macro.

Helper macro to declare a CPF attribute.

**Parameters**

- `_value` – Pointer to a struct `bt_gatt_cpf`.

`BT_GATT_DESCRIPTOR(_uuid, _perm, _read, _write, _user_data)`

Descriptor Declaration Macro.

Helper macro to declare a descriptor attribute.

**Parameters**

- `_uuid` – Descriptor attribute uuid.

- `_perm` – Descriptor attribute access permissions.
- `_read` – Descriptor attribute read callback.
- `_write` – Descriptor attribute write callback.
- `_user_data` – Descriptor attribute user data.

`BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)`

Attribute Declaration Macro.

Helper macro to declare an attribute.

#### Parameters

- `_uuid` – Attribute uuid.
- `_perm` – Attribute access permissions.
- `_read` – Attribute read callback.
- `_write` – Attribute write callback.
- `_user_data` – Attribute user data.

## Typedefs

`typedef uint8_t (*bt_gatt_attr_func_t)(const struct bt\_gatt\_attr *attr, uint16_t handle, void *user_data)`

Attribute iterator callback.

**Param attr** Attribute found.

**Param handle** Attribute handle found.

**Param user\_data** Data given.

**Return** `BT_GATT_ITER_CONTINUE` if should continue to the next attribute.

**Return** `BT_GATT_ITER_STOP` to stop.

`typedef void (*bt_gatt_complete_func_t)(struct bt_conn *conn, void *user_data)`

Notification complete result callback.

**Param conn** Connection object.

**Param user\_data** Data passed in by the user.

`typedef void (*bt_gatt_indicate_func_t)(struct bt_conn *conn, struct bt\_gatt\_indicate\_params *params, uint8_t err)`

Indication complete result callback.

**Param conn** Connection object.

**Param params** Indication params object.

**Param err** ATT error code

`typedef void (*bt_gatt_indicate_params_destroy_t)(struct bt\_gatt\_indicate\_params *params)`

## Enums

enum [anonymous]

Values:

enumerator BT\_GATT\_ITER\_STOP = 0

enumerator BT\_GATT\_ITER\_CONTINUE

## Functions

void bt\_gatt\_cb\_register(struct *bt\_gatt\_cb* \*cb)

Register GATT callbacks.

Register callbacks to monitor the state of GATT.

### Parameters

- cb – Callback struct.

int bt\_gatt\_service\_register(struct *bt\_gatt\_service* \*svc)

Register GATT service.

Register GATT service. Applications can make use of macros such as BT\_GATT\_PRIMARY\_SERVICE, BT\_GATT\_CHARACTERISTIC, BT\_GATT\_DESCRIPTOR, etc.

When using **:kconfig: `CONFIG\_BT\_SETTINGS`** then all services that should have bond configuration loaded, i.e. CCC values, must be registered before calling *settings\_load*.

When using **:kconfig: `CONFIG\_BT\_GATT\_CACHING`** and **:kconfig: `CONFIG\_BT\_SETTINGS`** then all services that should be included in the GATT Database Hash calculation should be added before calling *settings\_load*. All services registered after *settings\_load* will trigger a new database hash calculation and a new hash stored.

### Parameters

- svc – Service containing the available attributes

**Returns** 0 in case of success or negative value in case of error.

int bt\_gatt\_service\_unregister(struct *bt\_gatt\_service* \*svc)

Unregister GATT service. \*

### Parameters

- svc – Service to be unregistered.

**Returns** 0 in case of success or negative value in case of error.

void bt\_gatt\_foreach\_attr\_type(uint16\_t start\_handle, uint16\_t end\_handle, const struct *bt\_uuid* \*uuid, const void \*attr\_data, uint16\_t num\_matches, *bt\_gatt\_attr\_func\_t* func, void \*user\_data)

Attribute iterator by type.

Iterate attributes in the given range matching given UUID and/or data.

### Parameters

- start\_handle – Start handle.
- end\_handle – End handle.

- `uuid` – UUID to match, passing NULL skips UUID matching.
- `attr_data` – Attribute data to match, passing NULL skips data matching.
- `num_matches` – Number matches, passing 0 makes it unlimited.
- `func` – Callback function.
- `user_data` – Data to pass to the callback.

```
static inline void bt_gatt_foreach_attr(uint16_t start_handle, uint16_t end_handle,  
                                       bt_gatt_attr_func_t func, void *user_data)
```

Attribute iterator.

Iterate attributes in the given range.

#### Parameters

- `start_handle` – Start handle.
- `end_handle` – End handle.
- `func` – Callback function.
- `user_data` – Data to pass to the callback.

```
struct bt_gatt_attr *bt_gatt_attr_next(const struct bt_gatt_attr *attr)
```

Iterate to the next attribute.

Iterate to the next attribute following a given attribute.

#### Parameters

- `attr` – Current Attribute.

**Returns** The next attribute or NULL if it cannot be found.

```
struct bt_gatt_attr *bt_gatt_find_by_uuid(const struct bt_gatt_attr *attr, uint16_t attr_count,  
                                         const struct bt_uuid *uuid)
```

Find Attribute by UUID.

Find the attribute with the matching UUID. To limit the search to a service set the `attr` to the service attributes and the `attr_count` to the service attribute count .

#### Parameters

- `attr` – Pointer to an attribute that serves as the starting point for the search of a match for the UUID. Passing NULL will search the entire range.
- `attr_count` – The number of attributes from the starting point to search for a match for the UUID. Set to 0 to search until the end.
- `uuid` – UUID to match.

```
uint16_t bt_gatt_attr_get_handle(const struct bt_gatt_attr *attr)
```

Get Attribute handle.

#### Parameters

- `attr` – Attribute object.

**Returns** Handle of the corresponding attribute or zero if the attribute could not be found.

```
uint16_t bt_gatt_attr_value_handle(const struct bt_gatt_attr *attr)
```

Get the handle of the characteristic value descriptor.

---

**Note:** The `user_data` of the attribute must of type *bt\_gatt\_chrc*.

---

**Parameters**

- `attr` – A Characteristic Attribute.

**Returns** the handle of the corresponding Characteristic Value. The value will be zero (the invalid handle) if `attr` was not a characteristic attribute.

```
ssize_t bt_gatt_attr_read(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void *buf,
                        uint16_t buf_len, uint16_t offset, const void *value, uint16_t
                        value_len)
```

Generic Read Attribute value helper.

Read attribute value from local database storing the result into buffer.

**Parameters**

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value.
- `buf_len` – Buffer length.
- `offset` – Start offset.
- `value` – Attribute value.
- `value_len` – Length of the attribute value.

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_service(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void
                                *buf, uint16_t len, uint16_t offset)
```

Read Service Attribute helper.

Read service attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which `user_data` is a [bt\\_uuid](#).

---

**Parameters**

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_included(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void
                                *buf, uint16_t len, uint16_t offset)
```

Read Include Attribute helper.

Read include service attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which `user_data` is a [bt\\_gatt\\_include](#).

---

**Parameters**

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_chrc(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void *buf,  
                             uint16_t len, uint16_t offset)
```

Read Characteristic Attribute helper.

Read characteristic attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which `user_data` is a [bt\\_gatt\\_chrc](#).

---

#### Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_ccc(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void *buf,  
                             uint16_t len, uint16_t offset)
```

Read Client Characteristic Configuration Attribute helper.

Read CCC attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which `user_data` is a `_bt_gatt_ccc`.

---

#### Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_write_ccc(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, const void  
                             *buf, uint16_t len, uint16_t offset, uint8_t flags)
```

Write Client Characteristic Configuration Attribute helper.

Write value in the buffer into CCC attribute.

---

**Note:** Only use this with attributes which user\_data is a `_bt_gatt_ccc`.

---

#### Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.
- `flags` – Write flags.

**Returns** number of bytes written in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_cep(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void *buf,  
                             uint16_t len, uint16_t offset)
```

Read Characteristic Extended Properties Attribute helper.

Read CEP attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which user\_data is a `bt_gatt_cep`.

---

#### Parameters

- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length
- `offset` – Start offset

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_cud(struct bt_conn *conn, const struct bt\_gatt\_attr *attr, void *buf,  
                             uint16_t len, uint16_t offset)
```

Read Characteristic User Description Descriptor Attribute helper.

Read CUD attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which user\_data is a NULL-terminated C string.

---

#### Parameters

- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length
- `offset` – Start offset

**Returns** number of bytes read in case of success or negative values in case of error.

```
ssize_t bt_gatt_attr_read_cpf(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf,
                             uint16_t len, uint16_t offset)
```

Read Characteristic Presentation format Descriptor Attribute helper.

Read CPF attribute value from local database storing the result into buffer after encoding it.

---

**Note:** Only use this with attributes which user\_data is a *bt\_gatt\_pf*.

---

#### Parameters

- *conn* – Connection object
- *attr* – Attribute to read
- *buf* – Buffer to store the value read
- *len* – Buffer length
- *offset* – Start offset

**Returns** number of bytes read in case of success or negative values in case of error.

```
int bt_gatt_notify_cb(struct bt_conn *conn, struct bt_gatt_notify_params *params)
```

Notify attribute value change.

This function works in the same way as *bt\_gatt\_notify*. With the addition that after sending the notification the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the **:kconfig: `CONFIG\_BT\_CONN\_TX\_MAX`** option.

Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

#### Parameters

- *conn* – Connection object.
- *params* – Notification parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_notify_multiple(struct bt_conn *conn, uint16_t num_params, struct
                           bt_gatt_notify_params *params)
```

Notify multiple attribute value change.

This function works in the same way as *bt\_gatt\_notify\_cb*.

#### Parameters

- *conn* – Connection object.
- *num\_params* – Number of notification parameters.
- *params* – Array of notification parameters.

**Returns** 0 in case of success or negative value in case of error.

```
static inline int bt_gatt_notify(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void
                                *data, uint16_t len)
```

Notify attribute value change.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`.

#### Parameters

- `conn` – Connection object.
- `attr` – Characteristic or Characteristic Value attribute.
- `data` – Pointer to Attribute data.
- `len` – Attribute value length.

**Returns** 0 in case of success or negative value in case of error.

```
static inline int bt_gatt_notify_uuid(struct bt_conn *conn, const struct bt_uuid *uuid, const
                                     struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

Notify attribute value change by UUID.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection.

The attribute object is the starting point for the search of the UUID.

#### Parameters

- `conn` – Connection object.
- `uuid` – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the `attr` given, is used.
- `attr` – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
- `data` – Pointer to Attribute data.
- `len` – Attribute value length.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_indicate(struct bt_conn *conn, struct bt_gatt_indicate_params *params)
```

Indicate attribute value change.

Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`.

Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

---

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

---

#### Parameters

- `conn` – Connection object.
- `params` – Indicate parameters.

**Returns** 0 in case of success or negative value in case of error.

```
bool bt_gatt_is_subscribed(struct bt_conn *conn, const struct bt_gatt_attr *attr, uint16_t
                        ccc_value)
```

Check if connection have subscribed to attribute.

Check if connection has subscribed to attribute value change.

The attribute object can be the so called Characteristic Declaration, which is usually declared with BT\_GATT\_CHARACTERISTIC followed by BT\_GATT\_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT\_GATT\_CHARACTERISTIC, or the Client Characteristic Configuration Descriptor (CCCD) which is created by BT\_GATT\_CCC.

#### Parameters

- `conn` – Connection object.
- `attr` – Attribute object.
- `ccc_value` – The subscription type, either notifications or indications.

**Returns** true if the attribute object has been subscribed.

```
uint16_t bt_gatt_get_mtu(struct bt_conn *conn)
```

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

#### Parameters

- `conn` – Connection object.

**Returns** MTU in bytes

```
struct bt_gatt_ccc_cfg
```

*#include <gatt.h>* GATT CCC configuration entry.

#### Public Members

```
uint8_t id
```

Local identity, BT\_ID\_DEFAULT in most cases.

```
bt_addr_le_t peer
```

Remote peer address.

```
uint16_t value
```

Configuration value.

```
struct bt_gatt_notify_params
```

*#include <gatt.h>*

#### Public Members

```
const struct bt_uuid *uuid
```

Notification Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct *bt\_gatt\_attr* \*attr

Notification Attribute object.

Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

const void \*data

Notification Value data

uint16\_t len

Notification Value length

*bt\_gatt\_complete\_func\_t* func

Notification Value callback

void \*user\_data

Notification Value callback user data

struct bt\_gatt\_indicate\_params

*#include <gatt.h>* GATT Indicate Value parameters.

## Public Members

const struct *bt\_uuid* \*uuid

Indicate Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct *bt\_gatt\_attr* \*attr

Indicate Attribute object.

Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

*bt\_gatt\_indicate\_func\_t* func

Indicate Value callback

*bt\_gatt\_indicate\_params\_destroy\_t* destroy

Indicate operation complete callback

const void \*data

Indicate Value data

uint16\_t len

Indicate Value length

## GATT Client

group bt\_gatt\_client

## Typedefs

```
typedef uint8_t (*bt_gatt_discover_func_t)(struct bt_conn *conn, const struct bt\_gatt\_attr
*attr, struct bt\_gatt\_discover\_params *params)
```

Discover attribute callback function.

If discovery procedure has completed this callback will be called with attr set to NULL. This will not happen if procedure was stopped by returning BT\_GATT\_ITER\_STOP.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:

- uuid UUID representing the type of attribute.
- handle Handle in the remote database.
- user\_data The value of the attribute. Will be NULL when discovering descriptors

To be able to read the value of the discovered attribute the user\_data must be cast to an appropriate type.

- [bt\\_gatt\\_service\\_val](#) when UUID is [BT\\_UUID\\_GATT\\_PRIMARY](#) or [BT\\_UUID\\_GATT\\_SECONDARY](#).
- [bt\\_gatt\\_include](#) when UUID is [BT\\_UUID\\_GATT\\_INCLUDE](#).
- [bt\\_gatt\\_chrc](#) when UUID is [BT\\_UUID\\_GATT\\_CHRC](#).

**Param conn** Connection object.

**Param attr** Attribute found, or NULL if not found.

**Param params** Discovery parameters given.

**Return** BT\_GATT\_ITER\_CONTINUE to continue discovery procedure.

**Return** BT\_GATT\_ITER\_STOP to stop discovery procedure.

```
typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct
bt\_gatt\_read\_params *params, const void *data, uint16_t length)
```

Read callback function.

**Param conn** Connection object.

**Param err** ATT error code.

**Param params** Read parameters used.

**Param data** Attribute value data. NULL means read has completed.

**Param length** Attribute value length.

**Return** BT\_GATT\_ITER\_CONTINUE if should continue to the next attribute.

**Return** BT\_GATT\_ITER\_STOP to stop.

```
typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct
bt\_gatt\_write\_params *params)
```

Write callback function.

**Param conn** Connection object.

**Param err** ATT error code.

**Param params** Write parameters used.

```
typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct  
bt_gatt_subscribe_params *params, const void *data, uint16_t length)
```

Notification callback function.

In the case of an empty notification, the data pointer will be non-NULL while the length will be 0, which is due to the special case where a data NULL pointer means unsubscribed.

**Param conn** Connection object. May be NULL, indicating that the peer is being unpaired

**Param params** Subscription parameters.

**Param data** Attribute value data. If NULL then subscription was removed.

**Param length** Attribute value length.

**Return** BT\_GATT\_ITER\_CONTINUE to continue receiving value notifications.  
BT\_GATT\_ITER\_STOP to unsubscribe from value notifications.

## Enums

```
enum [anonymous]
```

GATT Discover types

*Values:*

```
enumerator BT_GATT_DISCOVER_PRIMARY
```

Discover Primary Services.

```
enumerator BT_GATT_DISCOVER_SECONDARY
```

Discover Secondary Services.

```
enumerator BT_GATT_DISCOVER_INCLUDE
```

Discover Included Services.

```
enumerator BT_GATT_DISCOVER_CHARACTERISTIC
```

Discover Characteristic Values.

Discover Characteristic Value and its properties.

```
enumerator BT_GATT_DISCOVER_DESCRIPTOR
```

Discover Descriptors.

Discover Attributes which are not services or characteristics.

@note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in extra round trips.

```
enumerator BT_GATT_DISCOVER_ATTRIBUTE
```

Discover Attributes.

Discover Attributes of `any` type.

@note The use of this `type` of discover `is not` recommended `for` discovering `in` ranges across multiple services/characteristics `as` it may incur `in` more `round` trips.

enumerator BT\_GATT\_DISCOVER\_STD\_CHAR\_DESC

Discover standard characteristic descriptor values.

Discover standard characteristic descriptor values `and` their properties.

Supported descriptors:

- Characteristic Extended Properties
- Client Characteristic Configuration
- Server Characteristic Configuration
- Characteristic Presentation Format

enum [anonymous]

Subscription flags

*Values:*

enumerator BT\_GATT\_SUBSCRIBE\_FLAG\_VOLATILE

Persistence flag.

If `set`, indicates that the subscription `is not` saved on the GATT server side. Therefore, upon disconnection, the subscription will be automatically removed `from the` client's subscriptions list `and` when the client reconnects, it will have to issue a new subscription.

enumerator BT\_GATT\_SUBSCRIBE\_FLAG\_NO\_RESUB

No resubscribe flag.

By default when BT\_GATT\_SUBSCRIBE\_FLAG\_VOLATILE `is` unset, the subscription will be automatically renewed when the client reconnects, `as` a workaround `for` GATT servers that do `not` persist subscriptions.

This flag will disable the automatic resubscription. It `is` useful `if` the application layer knows that the GATT server remembers subscriptions `from previous` connections `and` wants to avoid renewing the subscriptions.

enumerator BT\_GATT\_SUBSCRIBE\_FLAG\_WRITE\_PENDING

Write pending flag.

If `set`, indicates write operation `is` pending waiting remote end to respond.

enumerator `BT_GATT_SUBSCRIBE_NUM_FLAGS`

## Functions

`int bt_gatt_exchange_mtu(struct bt_conn *conn, struct bt\_gatt\_exchange\_params *params)`

Exchange MTU.

This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

---

**Note:** Shall only be used once per connection.

---

### Parameters

- `conn` – Connection object.
- `params` – Exchange MTU parameters.

**Returns** 0 in case of success or negative value in case of error.

`int bt_gatt_discover(struct bt_conn *conn, struct bt\_gatt\_discover\_params *params)`

GATT Discover function.

This procedure is used by a client to discover attributes on a server.

Primary Service Discovery: Procedure allows to discover specific Primary Service based on UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

---

**Note:** This procedure is asynchronous therefore the parameters need to remain valid while it is active.

---

### Parameters

- `conn` – Connection object.
- `params` – Discover parameters.

**Returns** 0 in case of success or negative value in case of error.

`int bt_gatt_read(struct bt_conn *conn, struct bt\_gatt\_read\_params *params)`

Read Attribute Value by handle.

This procedure reads the attribute value and returns it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the `start_handle` being updated for each instance.

If an instance does contain a long value which cannot be read entirely the caller will need to read the remaining data separately using the handle and offset.

---

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active.

---

#### Parameters

- `conn` – Connection object.
- `params` – Read parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_write(struct bt_conn *conn, struct bt_gatt_write_params *params)
```

Write Attribute Value by handle.

This procedure write the attribute value and return the result in the callback.

---

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active.

---

#### Parameters

- `conn` – Connection object.
- `params` – Write parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_write_without_response_cb(struct bt_conn *conn, uint16_t handle, const void  
                                     *data, uint16_t length, bool sign,  
                                     bt_gatt_complete_func_t func, void *user_data)
```

Write Attribute Value by handle without response with callback.

This function works in the same way as `bt_gatt_write_without_response`. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the **`:kconfig: CONFIG_BT_CONN_TX_MAX`** option.

---

**Note:** By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

---

#### Parameters

- `conn` – Connection object.
- `handle` – Attribute handle.
- `data` – Data to be written.
- `length` – Data length.
- `sign` – Whether to sign data
- `func` – Transmission complete callback.

- `user_data` – User data to be passed back to callback.

**Returns** 0 in case of success or negative value in case of error.

```
static inline int bt_gatt_write_without_response(struct bt_conn *conn, uint16_t handle, const
                                              void *data, uint16_t length, bool sign)
```

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed

#### Parameters

- `conn` – Connection object.
- `handle` – Attribute handle.
- `data` – Data to be written.
- `length` – Data length.
- `sign` – Whether to sign data

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_subscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)
```

Subscribe Attribute Value Notification.

This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

---

**Note:** Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

---

#### Parameters

- `conn` – Connection object.
- `params` – Subscribe parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_gatt_resubscribe(uint8_t id, const bt_addr_le_t *peer, struct bt_gatt_subscribe_params
                      *params)
```

Resubscribe Attribute Value Notification subscription.

Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

---

**Note:** Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

---

#### Parameters

- `id` – Local identity (in most cases `BT_ID_DEFAULT`).
- `peer` – Remote address.
- `params` – Subscribe parameters.

**Returns** 0 in case of success or negative value in case of error.

int bt\_gatt\_unsubscribe(struct bt\_conn \*conn, struct [bt\\_gatt\\_subscribe\\_params](#) \*params)  
Unsubscribe Attribute Value Notification.

This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.

**Parameters**

- conn – Connection object.
- params – Subscribe parameters.

**Returns** 0 in case of success or negative value in case of error.

void bt\_gatt\_cancel(struct bt\_conn \*conn, void \*params)  
Cancel GATT pending request.

**Parameters**

- conn – Connection object.
- params – Requested params address.

struct bt\_gatt\_exchange\_params  
*#include <gatt.h>* GATT Exchange MTU parameters.

**Public Members**

void (\*func)(struct bt\_conn \*conn, uint8\_t err, struct [bt\\_gatt\\_exchange\\_params](#) \*params)  
Response callback

struct bt\_gatt\_discover\_params  
*#include <gatt.h>* GATT Discover Attributes parameters.

**Public Members**

const struct [bt\\_uuid](#) \*uuid  
Discover UUID type

[bt\\_gatt\\_discover\\_func\\_t](#) func  
Discover attribute callback

uint16\_t attr\_handle  
Include service attribute declaration handle

uint16\_t start\_handle  
Included service start handle  
Discover start handle

uint16\_t end\_handle

Included service end handle

Discover end handle

uint8\_t type

Discover type

struct bt\_gatt\_read\_params

*#include <gatt.h>* GATT Read parameters.

## Public Members

*bt\_gatt\_read\_func\_t* func

Read attribute callback.

size\_t handle\_count

If equals to 1 single.handle and single.offset are used. If greater than 1 multiple.handles are used. If equals to 0 by\_uuid is used for Read Using Characteristic UUID.

uint16\_t handle

Attribute handle.

uint16\_t offset

Attribute data offset.

uint16\_t \*handles

Attribute handles to read with Read Multiple Characteristic Values.

bool variable

If true use Read Multiple Variable Length Characteristic Values procedure. The values of the set of attributes may be of variable or unknown length. If false use Read Multiple Characteristic Values procedure. The values of the set of attributes must be of a known fixed length, with the exception of the last value that can have a variable length.

uint16\_t start\_handle

First requested handle number.

uint16\_t end\_handle

Last requested handle number.

const struct *bt\_uuid* \*uuid

2 or 16 octet UUID.

struct bt\_gatt\_write\_params

*#include <gatt.h>* GATT Write parameters.

### Public Members

*bt\_gatt\_write\_func\_t* func

Response callback

uint16\_t handle

Attribute handle

uint16\_t offset

Attribute data offset

const void \*data

Data to be written

uint16\_t length

Length of the data

struct bt\_gatt\_subscribe\_params

*#include <gatt.h>* GATT Subscribe parameters.

### Public Members

*bt\_gatt\_notify\_func\_t* notify

Notification value callback

*bt\_gatt\_write\_func\_t* write

Subscribe CCC write request response callback

uint16\_t value\_handle

Subscribe value handle

uint16\_t ccc\_handle

Subscribe CCC handle

uint16\_t value

Subscribe value

atomic\_t flags[*ATOMIC\_BITMAP\_SIZE*(*BT\_GATT\_SUBSCRIBE\_NUM\_FLAGS*)]

Subscription flags

## Functions

```
static inline uint8_t bt_hci_evt_get_flags(uint8_t evt)
```

Get HCI event flags.

Helper for the HCI driver to get HCI event flags that describes rules that must be followed.

When `CONFIG_BT_RECV_IS_RX_THREAD` is enabled the flags `BT_HCI_EVT_FLAG_RECV` and `BT_HCI_EVT_FLAG_RECV_PRIO` indicates if the event should be given to `bt_recv` or `bt_recv_prio`.

#### Parameters

- `evt` – HCI event code.

**Returns** HCI event flags for the specified event.

```
int bt_recv(struct net_buf *buf)
```

Receive data from the controller/HCI driver.

This is the main function through which the HCI driver provides the host with data from the controller. The buffer needs to have its type set with the help of `bt_buf_set_type()` before calling this API.

When `CONFIG_BT_RECV_IS_RX_THREAD` is defined then this API should not be used for so-called high priority HCI events, which should instead be delivered to the host stack through `bt_recv_prio()`.

#### Parameters

- `buf` – Network buffer containing data from the controller.

**Returns** 0 on success or negative error number on failure.

```
int bt_recv_prio(struct net_buf *buf)
```

Receive high priority data from the controller/HCI driver.

This is the same as `bt_recv()`, except that it should be used for so-called high priority HCI events. There's a separate `bt_hci_evt_get_flags()` helper that can be used to identify which events have the `BT_HCI_EVT_FLAG_RECV_PRIO` flag set.

As with `bt_recv()`, the buffer needs to have its type set with the help of `bt_buf_set_type()` before calling this API. The only exception is so called high priority HCI events which should be delivered to the host stack through `bt_recv_prio()` instead.

#### Parameters

- `buf` – Network buffer containing data from the controller.

**Returns** 0 on success or negative error number on failure.

```
uint8_t bt_read_static_addr(struct bt_hci_vs_static_addr addrs[], uint8_t size)
```

Read static addresses from the controller.

#### Parameters

- `addrs` – Random static address and Identity Root (IR) array.
- `size` – Size of array.

**Returns** Number of addresses read.

```
int bt_hci_driver_register(const struct bt_hci_driver *drv)
```

Register a new HCI driver to the Bluetooth stack.

This needs to be called before any application code runs. The `bt_enable()` API will fail if there is no driver registered.

#### Parameters

- `drv` – A `bt_hci_driver` struct representing the driver.

**Returns** 0 on success or negative error number on failure.

int bt\_hci\_transport\_setup(const struct *device* \*dev)

Setup the HCI transport, which usually means to reset the Bluetooth IC.

---

**Note:** A weak version of this function is included in the H4 driver, so defining it is optional per board.

---

#### Parameters

- dev – The device structure for the bus connecting to the IC

**Returns** 0 on success, negative error value on failure

struct *net\_buf* \*bt\_hci\_evt\_create(uint8\_t evt, uint8\_t len)

Allocate an HCI event buffer.

This function allocates a new buffer for an HCI event. It is given the event code and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

#### Parameters

- evt – Event OpCode.
- len – Length of event parameters.

**Returns** Newly allocated buffer.

struct *net\_buf* \*bt\_hci\_cmd\_complete\_create(uint16\_t op, uint8\_t plen)

Allocate an HCI Command Complete event buffer.

This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the BT\_OP macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

#### Parameters

- op – Command OpCode.
- plen – Length of command parameters.

**Returns** Newly allocated buffer.

struct *net\_buf* \*bt\_hci\_cmd\_status\_create(uint16\_t op, uint8\_t status)

Allocate an HCI Command Status event buffer.

This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT\_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

#### Parameters

- op – Command OpCode.
- status – Status code.

**Returns** Newly allocated buffer.

struct bt\_hci\_driver

#include <hci\_driver.h> Abstraction which represents the HCI transport to the controller.

This struct is used to represent the HCI transport to the Bluetooth controller.

## Public Members

const char \*name

Name of the driver

enum [bt\\_hci\\_driver\\_bus](#) bus

Bus of the transport (BT\_HCI\_DRIVER\_BUS\_\*)

uint32\_t quirks

Specific controller quirks. These are set by the HCI driver and acted upon by the host. They can either be statically set at buildtime, or set at runtime before the HCI driver's [open\(\)](#) callback returns.

int (\*open)(void)

Open the HCI transport.

Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the [send\(\)](#) handler.

If the driver uses its own RX thread, i.e. CONFIG\_BT\_RECV\_IS\_RX\_THREAD is set, then this function is expected to start that thread.

**Return** 0 on success or negative error number on failure.

int (\*send)(struct [net\\_buf](#) \*buf)

Send HCI buffer to controller.

Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of [bt\\_buf\\_get\\_type\(\)](#).

---

**Note:** This function must only be called from a cooperative thread.

---

**Param** buf Buffer containing data to be sent to the controller.

**Return** 0 on success or negative error number on failure.

## 7.4.8 HCI RAW channel

### Overview

HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

### API Reference

group hci\_raw

HCI RAW channel.

### Defines

BT\_HCI\_ERR\_EXT\_HANDLED

BT\_HCI\_RAW\_CMD\_EXT(\_op, \_min\_len, \_func)

Helper macro to define a command extension

**Parameters**

- `_op` – Opcode of the command.
- `_min_len` – Minimal length of the command.
- `_func` – Handler function to be called.

## Enums

enum [anonymous]

*Values:*

enumerator BT\_HCI\_RAW\_MODE\_PASSTHROUGH = 0x00

Passthrough mode

While `in` this mode the buffers are passed `as is` between the stack and the driver.

enumerator BT\_HCI\_RAW\_MODE\_H4 = 0x01

H:4 mode

While `in` this mode H:4 headers will added into the buffers according to the buffer `type` when coming `from the` stack and will be removed and used to `set` the buffer `type`.

## Functions

int bt\_send(struct *net\_buf* \*buf)

Send packet to the Bluetooth controller.

Send packet to the Bluetooth controller. Caller needs to implement netbuf pool.

**Parameters**

- `buf` – netbuf packet to be send

**Returns** Zero on success or (negative) error code otherwise.

int bt\_hci\_raw\_set\_mode(uint8\_t mode)

Set Bluetooth RAW channel mode.

Set access mode of Bluetooth RAW channel.

**Parameters**

- `mode` – Access mode.

**Returns** Zero on success or (negative) error code otherwise.

uint8\_t bt\_hci\_raw\_get\_mode(void)

Get Bluetooth RAW channel mode.

Get access mode of Bluetooth RAW channel.

**Returns** Access mode.

```
void bt_hci_raw_cmd_ext_register(struct bt_hci_raw_cmd_ext *cmds, size_t size)
```

Register Bluetooth RAW command extension table.

Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

#### Parameters

- `cmds` – Pointer to the command extension table.
- `size` – Size of the command extension table.

```
int bt_enable_raw(struct k_fifo *rx_queue)
```

Enable Bluetooth RAW channel:

Enable Bluetooth RAW HCI channel.

#### Parameters

- `rx_queue` – netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

**Returns** Zero on success or (negative) error code otherwise.

```
struct bt_hci_raw_cmd_ext
```

```
#include <hci_raw.h>
```

#### Public Members

```
uint16_t op
```

Opcode of the command

```
size_t min_len
```

Minimal length of the command

```
uint8_t (*func)(struct net_buf *buf)
```

Handler function.

Handler function to be called when a command is intercepted.

**Param** `buf` Buffer containing the command.

**Return** HCI Status code or `BT_HCI_ERR_EXT_HANDLED` if command has been handled already and a response has been sent as oppose to `BT_HCI_ERR_SUCCESS` which just indicates that the command can be sent to the controller to be processed.

### 7.4.9 Hands Free Profile (HFP)

#### API Reference

```
group bt_hfp
```

Hands Free Profile (HFP)

## Defines

HFP\_HF\_CMD\_OK

HFP\_HF\_CMD\_ERROR

HFP\_HF\_CMD\_CME\_ERROR

HFP\_HF\_CMD\_UNKNOWN\_ERROR

## Enums

enum bt\_hfp\_hf\_at\_cmd

*Values:*

enumerator BT\_HFP\_HF\_ATA

enumerator BT\_HFP\_HF\_AT\_CHUP

## Functions

int bt\_hfp\_hf\_register(struct [bt\\_hfp\\_hf\\_cb](#) \*cb)

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

### Parameters

- `cb` – callback structure.

**Returns** 0 in case of success or negative value in case of error.

int bt\_hfp\_hf\_send\_cmd(struct bt\_conn \*conn, enum [bt\\_hfp\\_hf\\_at\\_cmd](#) cmd)

Handsfree client Send AT.

Send specific AT commands to handsfree client profile.

### Parameters

- `conn` – Connection object.
- `cmd` – AT command to be sent.

**Returns** 0 in case of success or negative value in case of error.

struct bt\_hfp\_hf\_cmd\_complete

*#include <hfp\_hf.h>* HFP HF Command completion field.

struct bt\_hfp\_hf\_cb

*#include <hfp\_hf.h>* HFP profile application callback.

## Public Members

void (\*connected)(struct bt\_conn \*conn)

HF connected callback to application

If this callback is provided it will be called whenever the connection completes.

**Param conn** Connection object.

void (\*disconnected)(struct bt\_conn \*conn)

HF disconnected callback to application

If this callback is provided it will be called whenever the connection gets disconnected, including when a connection gets rejected or cancelled or any error in SLC establishment.

**Param conn** Connection object.

void (\*service)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides service indicator value to the application

**Param conn** Connection object.

**Param value** service indicator value received from the AG.

void (\*call)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides call indicator value to the application

**Param conn** Connection object.

**Param value** call indicator value received from the AG.

void (\*call\_setup)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides call setup indicator value to the application

**Param conn** Connection object.

**Param value** call setup indicator value received from the AG.

void (\*call\_held)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides call held indicator value to the application

**Param conn** Connection object.

**Param value** call held indicator value received from the AG.

void (\*signal)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides signal indicator value to the application

**Param conn** Connection object.

**Param value** signal indicator value received from the AG.

void (\*roam)(struct bt\_conn \*conn, uint32\_t value)

HF indicator Callback

This callback provides roaming indicator value to the application

**Param conn** Connection object.

**Param value** roaming indicator value received from the AG.

```
void (*battery)(struct bt_conn *conn, uint32_t value)
```

HF indicator Callback

This callback battery service indicator value to the application

**Param conn** Connection object.

**Param value** battery indicator value received from the AG.

```
void (*ring_indication)(struct bt_conn *conn)
```

HF incoming call Ring indication callback to application

If this callback is provided it will be called whenever there is an incoming call.

**Param conn** Connection object.

```
void (*cmd_complete_cb)(struct bt_conn *conn, struct bt_hfp_hf_cmd_complete *cmd)
```

HF notify command completed callback to application

The command sent from the application is notified about its status

**Param conn** Connection object.

**Param cmd** structure contains status of the command including cme.

#### 7.4.10 Logical Link Control and Adaptation Protocol (L2CAP)

L2CAP layer enables connection-oriented channels which can be enable with the configuration option: **:kconfig: `CONFIG\_BT\_L2CAP\_DYNAMIC\_CHANNEL`**. This channels support segmentation and re-assembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the `bt_l2cap_chan` struct which contains the callbacks in the `bt_l2cap_chan_ops` struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the `recv` callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using `bt_l2cap_chan_recv_complete()` API if processing is asynchronous.

---

**Note:** The `recv` callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

---

For sending data the `bt_l2cap_chan_send()` API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using `bt_l2cap_server_register()` API passing the `bt_l2cap_server` struct which informs what psm it should listen to, the required security level `sec_level`, and the callback `accept` which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of `bt_l2cap_chan_connect()` API and can be disconnected with the `bt_l2cap_chan_disconnect()` API. Note that the later can also disconnect channel instances created by servers.

#### API Reference

group `bt_l2cap`

L2CAP.

#### Defines

BT\_L2CAP\_HDR\_SIZE

L2CAP PDU header size, used for buffer size calculations

BT\_L2CAP\_TX\_MTU

Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

BT\_L2CAP\_RX\_MTU

Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

BT\_L2CAP\_BUF\_SIZE(mtu)

Helper to calculate needed buffer size for L2CAP PDUs. Useful for creating buffer pools.

**Parameters**

- `mtu` – Needed L2CAP PDU MTU.

**Returns** Needed buffer size to match the requested L2CAP PDU MTU.

BT\_L2CAP\_SDU\_HDR\_SIZE

L2CAP SDU header size, used for buffer size calculations

BT\_L2CAP\_SDU\_TX\_MTU

Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.

The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmentation, i.e a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application buffer pool.

BT\_L2CAP\_SDU\_RX\_MTU

Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.

The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmentation, i.e a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application buffer pool. The application will have to define an `alloc_buf` callback for the channel in order to support receiving segmented L2CAP SDUs.

BT\_L2CAP\_SDU\_BUF\_SIZE(mtu)

Helper to calculate needed buffer size for L2CAP SDUs. Useful for creating buffer pools.

**Parameters**

- `mtu` – Required BT\_L2CAP\_\*\_SDU.

**Returns** Needed buffer size to match the requested L2CAP SDU MTU.

BT\_L2CAP\_LE\_CHAN(\_ch)

Helper macro getting container object of type `bt_l2cap_le_chan` address having the same container chan member address as object in question.

**Parameters**

- `_ch` – Address of object of `bt_l2cap_chan` type

**Returns** Address of in memory `bt_l2cap_le_chan` object type containing the address of in question object.

BT\_L2CAP\_CHAN\_SEND\_RESERVE

Headroom needed for outgoing L2CAP PDUs.

BT\_L2CAP\_SDU\_CHAN\_SEND\_RESERVE

Headroom needed for outgoing L2CAP SDUs.

## Typedefs

typedef void (\*bt\_l2cap\_chan\_destroy\_t)(struct *bt\_l2cap\_chan* \*chan)

Channel destroy callback.

**Param chan** Channel object.

typedef enum *bt\_l2cap\_chan\_state* bt\_l2cap\_chan\_state\_t

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

typedef enum *bt\_l2cap\_chan\_status* bt\_l2cap\_chan\_status\_t

Status of L2CAP channel.

## Enums

enum bt\_l2cap\_chan\_state

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

*Values:*

enumerator BT\_L2CAP\_DISCONNECTED

Channel disconnected

enumerator BT\_L2CAP\_CONNECT

Channel in connecting state

enumerator BT\_L2CAP\_CONFIG

Channel in config state, BR/EDR specific

enumerator BT\_L2CAP\_CONNECTED

Channel ready for upper layer traffic on it

enumerator BT\_L2CAP\_DISCONNECT

Channel in disconnecting state

enum bt\_l2cap\_chan\_status

Status of L2CAP channel.

*Values:*

enumerator BT\_L2CAP\_STATUS\_OUT

Channel output status

enumerator BT\_L2CAP\_STATUS\_SHUTDOWN

Channel shutdown status.

Once this status **is** notified it means the channel will no longer be able to transmit **or** receive data.

enumerator BT\_L2CAP\_STATUS\_ENCRYPT\_PENDING

Channel encryption pending status.

enumerator BT\_L2CAP\_NUM\_STATUS

## Functions

int bt\_l2cap\_server\_register(struct *bt\_l2cap\_server* \*server)

Register L2CAP server.

Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

### Parameters

- server – Server structure.

**Returns** 0 in case of success or negative value in case of error.

int bt\_l2cap\_br\_server\_register(struct *bt\_l2cap\_server* \*server)

Register L2CAP server on BR/EDR oriented connection.

Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

### Parameters

- server – Server structure.

**Returns** 0 in case of success or negative value in case of error.

int bt\_l2cap\_ecred\_chan\_connect(struct *bt\_conn* \*conn, struct *bt\_l2cap\_chan* \*\*chans, uint16\_t psm)

Connect Enhanced Credit Based L2CAP channels.

Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

### Parameters

- `conn` – Connection object.
- `chans` – Array of channel objects.
- `psm` – Channel PSM to connect to.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_l2cap_chan_connect(struct bt_conn *conn, struct bt\_l2cap\_chan *chan, uint16_t psm)
```

Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed `channel_connected()` callback will be called. If the connection is rejected `disconnected()` callback is called instead. Channel object passed (over an address of it) as second parameter shouldn't be instantiated in application as standalone. Instead of, application should create transport dedicated L2CAP objects, i.e. type of [bt\\_l2cap\\_le\\_chan](#) for LE and/or type of [bt\\_l2cap\\_br\\_chan](#) for BR/EDR. Then pass to this API the location (address) of [bt\\_l2cap\\_chan](#) type object which is a member of both transport dedicated objects.

#### Parameters

- `conn` – Connection object.
- `chan` – Channel object.
- `psm` – Channel PSM to connect to.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_l2cap_chan_disconnect(struct bt\_l2cap\_chan *chan)
```

Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result the channel `disconnected()` callback is called. Regarding to input parameter, to get details see reference description to [bt\\_l2cap\\_chan\\_connect\(\)](#) API above.

#### Parameters

- `chan` – Channel object.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_l2cap_chan_send(struct bt\_l2cap\_chan *chan, struct net\_buf *buf)
```

Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, `buf` will be queued and sent as and when credits are received from peer. Regarding to first input parameter, to get details see reference description to [bt\\_l2cap\\_chan\\_connect\(\)](#) API above.

When sending L2CAP data over an BR/EDR connection the application is sending L2CAP PDUs. The application is required to have reserved [BT\\_L2CAP\\_CHAN\\_SEND\\_RESERVE](#) bytes in the buffer before sending. The application should use the [BT\\_L2CAP\\_BUF\\_SIZE\(\)](#) helper to correctly size the buffers for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs. The application can optionally reserve [BT\\_L2CAP\\_SDU\\_CHAN\\_SEND\\_RESERVE](#) bytes in the buffer before sending. By reserving bytes in the buffer the stack can use this buffer as a segment directly, otherwise it will have to allocate a new segment for the first segment. If the application is reserving the bytes it should use the [BT\\_L2CAP\\_BUF\\_SIZE\(\)](#) helper to correctly size the buffers for the outgoing buffer pool. When segmenting an L2CAP SDU into L2CAP PDUs the stack will first attempt to allocate buffers from the original buffer pool of the L2CAP SDU before using the stack's own buffer pool.

---

**Note:** Buffer ownership is transferred to the stack in case of success, in case of an error the caller retains the ownership of the buffer.

---

**Returns** Bytes sent in case of success or negative value in case of error.

```
int bt_l2cap_chan_recv_complete(struct bt_l2cap_chan *chan, struct net_buf *buf)
```

Complete receiving L2CAP channel data.

Complete the reception of incoming data. This shall only be called if the channel recv callback has returned -EINPROGRESS to process some incoming data. The buffer shall contain the original user\_data as that is used for storing the credits/segments used by the packet.

**Parameters**

- chan – Channel object.
- buf – Buffer containing the data.

**Returns** 0 in case of success or negative value in case of error.

```
struct bt_l2cap_chan
```

*#include <l2cap.h>* L2CAP Channel structure.

**Public Members**

```
struct bt_conn *conn
```

Channel connection reference

```
const struct bt_l2cap_chan_ops *ops
```

Channel operations reference

```
struct bt_l2cap_le_endpoint
```

*#include <l2cap.h>* LE L2CAP Endpoint structure.

**Public Members**

```
uint16_t cid
```

Endpoint Channel Identifier (CID)

```
uint16_t mtu
```

Endpoint Maximum Transmission Unit

```
uint16_t mps
```

Endpoint Maximum PDU payload Size

```
uint16_t init_credits
```

Endpoint initial credits

```
atomic_t credits
```

Endpoint credits

```
struct bt_l2cap_le_chan
```

*#include <l2cap.h>* LE L2CAP Channel structure.

### Public Members

struct *bt\_l2cap\_chan* chan

Common L2CAP channel reference object

struct *bt\_l2cap\_le\_endpoint* rx

Channel Receiving Endpoint.

If the application has set an `alloc_buf` channel callback for the channel to support receiving segmented L2CAP SDUs the application should initialize the MTU of the Receiving Endpoint. Otherwise the MTU of the receiving endpoint will be initialized to *BT\_L2CAP\_SDU\_RX\_MTU* by the stack.

struct *bt\_l2cap\_le\_endpoint* tx

Channel Transmission Endpoint

struct `k_fifo` tx\_queue

Channel Transmission queue

struct *net\_buf* \*tx\_buf

Channel Pending Transmission buffer

struct *k\_work* tx\_work

Channel Transmission work

struct *bt\_l2cap\_br\_endpoint*

*#include <l2cap.h>* BREDR L2CAP Endpoint structure.

### Public Members

uint16\_t cid

Endpoint Channel Identifier (CID)

uint16\_t mtu

Endpoint Maximum Transmission Unit

struct *bt\_l2cap\_br\_chan*

*#include <l2cap.h>* BREDR L2CAP Channel structure.

### Public Members

struct *bt\_l2cap\_chan* chan

Common L2CAP channel reference object

struct *bt\_l2cap\_br\_endpoint* rx

Channel Receiving Endpoint

```
struct bt_l2cap_br_endpoint tx
    Channel Transmission Endpoint
```

```
struct bt_l2cap_chan_ops
    #include <l2cap.h> L2CAP Channel operations structure.
```

## Public Members

```
void (*connected)(struct bt_l2cap_chan *chan)
    Channel connected callback.
```

If this callback is provided it will be called whenever the connection completes.  
**Param chan** The channel that has been connected

```
void (*disconnected)(struct bt_l2cap_chan *chan)
    Channel disconnected callback.
```

If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.  
**Param chan** The channel that has been Disconnected

```
void (*encrypt_change)(struct bt_l2cap_chan *chan, uint8_t hci_status)
    Channel encrypt_change callback.
```

If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host's controller.

**Param chan** The channel which has made encryption status changed.

**Param status** HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

```
struct net_buf *(*alloc_buf)(struct bt_l2cap_chan *chan)
    Channel alloc_buf callback.
```

If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that requires segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to *BT\_L2CAP\_SDU\_RX\_MTU*.

**Param chan** The channel requesting a buffer.

**Return** Allocated buffer.

```
int (*recv)(struct bt_l2cap_chan *chan, struct net_buf *buf)
    Channel recv callback.
```

**Param chan** The channel receiving data.

**Param buf** Buffer containing incoming data.

**Return** 0 in case of success or negative value in case of error.

**Return** -EINPROGRESS in case where user has to confirm once the data has been processed by calling *bt\_l2cap\_chan\_recv\_complete* passing back the buffer received with its original user\_data which contains the number of segments/credits used by the packet.

```
void (*sent)(struct bt\_l2cap\_chan *chan)
```

Channel sent callback.

If this callback is provided it will be called whenever a SDU has been completely sent.

**Param chan** The channel which has sent data.

```
void (*status)(struct bt\_l2cap\_chan *chan, atomic_t *status)
```

Channel status callback.

If this callback is provided it will be called whenever the channel status changes.

**Param chan** The channel which status changed

**Param status** The channel status

```
struct bt_l2cap_server
```

*#include <l2cap.h>* L2CAP Server structure.

## Public Members

```
uint16_t psm
```

Server PSM.

Possible values: 0 A dynamic value will be auto-allocated when [bt\\_l2cap\\_server\\_register\(\)](#) is called.

0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.

0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

```
bt\_security\_t sec_level
```

Required minimum security level

```
int (*accept)(struct bt_conn *conn, struct bt\_l2cap\_chan **chan)
```

Server accept callback.

This callback is called whenever a new incoming connection requires authorization.

**Param conn** The connection that is requesting authorization

**Param chan** Pointer to received the allocated channel

**Return** 0 in case of success or negative value in case of error.

**Return** -ENOMEM if no available space for new channel.

**Return** -EACCES if application did not authorize the connection.

**Return** -EPERM if encryption key size is too short.

### 7.4.11 Bluetooth Mesh Profile

The Bluetooth mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy. This module implements the [Bluetooth Mesh Profile Specification v1.0.1](#).

Read more about Bluetooth mesh on the [Bluetooth SIG Website](#).

## Core

The core provides functionality for managing the general Bluetooth mesh state.

**Low Power Node** The Low Power Node (LPN) role allows battery powered devices to participate in a mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages.

The radio control and polling is managed automatically by the mesh stack, but the LPN API allows the application to trigger the polling at any time through `bt_mesh_lpn_poll()`. The LPN operation parameters, including poll interval, poll event timing and Friend requirements is controlled through the `:kconfig: `CONFIG_BT_MESH_LOW_POWER`` option and related configuration options.

**Replay Protection List** The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks.

To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, @ref CONFIG\_BT\_MESH\_RPL\_STORE\_TIMEOUT can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn't completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss) by calling @ref bt\_mesh\_rpl\_pending\_store. This is up to the node to decide, which RPL entries are to be stored in this case.

Setting @ref CONFIG\_BT\_MESH\_RPL\_STORE\_TIMEOUT to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between @ref CONFIG\_BT\_MESH\_RPL\_STORE\_TIMEOUT and calling @ref bt\_mesh\_rpl\_pending\_store may reduce a risk of security vulnerability and flash wear out.

## API reference

*group* bt\_mesh

Bluetooth mesh.

### Defines

BT\_MESH\_NET\_PRIMARY

BT\_MESH\_FEAT\_RELAY

Relay feature

BT\_MESH\_FEAT\_PROXY

GATT Proxy feature

BT\_MESH\_FEAT\_FRIEND

Friend feature

BT\_MESH\_FEAT\_LOW\_POWER

Low Power Node feature

BT\_MESH\_FEAT\_SUPPORTED

BT\_MESH\_LPN\_CB\_DEFINE(\_name)

Register a callback structure for Friendship events.

**Parameters**

- `_name` – Name of callback structure.

BT\_MESH\_FRIEND\_CB\_DEFINE(\_name)

Register a callback structure for Friendship events.

Registers a callback structure that will be called whenever Friendship gets established or terminated.

**Parameters**

- `_name` – Name of callback structure.

## Functions

int bt\_mesh\_init(const struct [bt\\_mesh\\_prov](#) \*prov, const struct [bt\\_mesh\\_comp](#) \*comp)

Initialize Mesh support.

After calling this API, the node will not automatically advertise as unprovisioned, rather the [bt\\_mesh\\_prov\\_enable\(\)](#) API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

**Parameters**

- `prov` – Node provisioning information.
- `comp` – Node Composition.

**Returns** Zero on success or (negative) error code otherwise.

void bt\_mesh\_reset(void)

Reset the state of the local Mesh node.

Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.

After calling this API, the node will not automatically advertise as unprovisioned, rather the [bt\\_mesh\\_prov\\_enable\(\)](#) API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

int bt\_mesh\_suspend(void)

Suspend the Mesh network temporarily.

This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

**Returns** 0 on success, or (negative) error code on failure.

int bt\_mesh\_resume(void)

Resume a suspended Mesh network.

This API resumes the local node, after it has been suspended using the [bt\\_mesh\\_suspend\(\)](#) API.

**Returns** 0 on success, or (negative) error code on failure.

`void bt_mesh_iv_update_test(bool enable)`

Toggle the IV Update test mode.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

**Parameters**

- `enable` – true to enable IV Update test mode, false to disable it.

`bool bt_mesh_iv_update(void)`

Toggle the IV Update state.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

**Returns** true if IV Update In Progress state was entered, false otherwise.

`int bt_mesh_lpn_set(bool enable)`

Toggle the Low Power feature of the local device.

Enables or disables the Low Power feature of the local device. This is exposed as a run-time feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

**Parameters**

- `enable` – true to enable LPN functionality, false to disable it.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_mesh_lpn_poll(void)`

Send out a Friend Poll message.

Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

**Returns** Zero on success or (negative) error code otherwise.

`int bt_mesh_friend_terminate(uint16_t lpn_addr)`

Terminate Friendship.

Terminated Friendship for given LPN.

**Parameters**

- `lpn_addr` – Low Power Node address.

**Returns** Zero on success or (negative) error code otherwise.

`void bt_mesh_rpl_pending_store(uint16_t addr)`

Store pending RPL entry(ies) in the persistent storage.

This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.

---

**Note:** When flash is used as the persistent storage, calling this API too frequently may wear it out.

---

**Parameters**

- `addr` – Address of the node which RPL entry needs to be stored or [`BT\_MESH\_ADDR\_ALL\_NODES`](#) to store all pending RPL entries.

`struct bt_mesh_lpn_cb`

*#include <main.h>* Low Power Node callback functions.

## Public Members

void (\*established)(uint16\_t net\_idx, uint16\_t friend\_addr, uint8\_t queue\_size, uint8\_t rcv\_window)

Friendship established.

This callback notifies the application that friendship has been successfully established.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param friend\_addr** Friend address.

**Param queue\_size** Friend queue size.

**Param rcv\_window** Low Power Node's listens duration for Friend response.

void (\*terminated)(uint16\_t net\_idx, uint16\_t friend\_addr)

Friendship terminated.

This callback notifies the application that friendship has been terminated.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param friend\_addr** Friend address.

void (\*polled)(uint16\_t net\_idx, uint16\_t friend\_addr, bool retry)

Local Poll Request.

This callback notifies the application that the local node has polled the friend node.

This callback will be called before [\*bt\\_mesh\\_lpn\\_cb::established\*](#) when attempting to establish a friendship.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param friend\_addr** Friend address.

**Param retry** Retry or first poll request for each transaction.

struct bt\_mesh\_friend\_cb

*#include <main.h>* Friend Node callback functions.

## Public Members

void (\*established)(uint16\_t net\_idx, uint16\_t lpn\_addr, uint8\_t rcv\_delay, uint32\_t polltimeout)

Friendship established.

This callback notifies the application that friendship has been successfully established.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param lpn\_addr** Low Power Node address.

**Param rcv\_delay** Receive Delay in units of 1 millisecond.

**Param polltimeout** PollTimeout in units of 1 millisecond.

void (\*terminated)(uint16\_t net\_idx, uint16\_t lpn\_addr)

Friendship terminated.

This callback notifies the application that friendship has been terminated.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param lpn\_addr** Low Power Node address.

void (\*polled)(uint16\_t net\_idx, uint16\_t lpn\_addr)

Friend Poll Request.

This callback notifies the application that the low power node has polled the friend node.

This callback will be called before `bt_mesh_friend_cb::established` when attempting to establish a friendship.

**Param net\_idx** NetKeyIndex used during friendship establishment.

**Param lpn\_addr** LPN address.

## Access layer

The access layer is the application's interface to the Bluetooth mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

**Mesh models** The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into *elements*. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to `bt_mesh_init()` during initialization. The Bluetooth SIG have defined a set of foundation models (see *Foundation models*) and a set of models for implementing common behavior in the *Bluetooth Mesh Model Specification*. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the *Configuration Server*:

**Opcode list** The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special `BT_MESH_MODEL_OP_END` entry. This entry must always be present in the opcode list, unless the list is empty. In that case, `BT_MESH_MODEL_NO_OPS` should be used in place of a proper opcode list definition.

**AppKey list** The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the `:kconfig: CONFIG_BT_MESH_MODEL_KEY_COUNT` configuration option. The contents of the AppKey list is managed by the *Configuration Server*.

**Subscription list** A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the `:kconfig: CONFIG_BT_MESH_MODEL_GROUP_COUNT` configuration option. The contents of the subscription list is managed by the *Configuration Server*.

**Model publication** The models may send messages in two ways:

- By specifying a set of message parameters in a `bt_mesh_msg_ctx`, and calling `bt_mesh_model_send()`.
- By setting up a `bt_mesh_model_pub` structure and calling `bt_mesh_model_publish()`.

When publishing messages with `bt_mesh_model_publish()`, the model will use the publication parameters configured by the [Configuration Server](#). This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to `bt_mesh_model_pub.msg`. The Config Server may also set up period publication for the publication message. To support this, the model must populate the `bt_mesh_model_pub.update` callback. The `bt_mesh_model_pub.update` callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

**Extended models** The Bluetooth mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an "extension tree". All models in an extension tree share a single subscription list per element it spans.

Model extensions are done by calling `bt_mesh_model_extend()` during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.

The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with `:kconfig: `CONFIG_BT_MESH_MODEL_EXTENSIONS`` to have any effect.

**Model data storage** Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling `bt_mesh_model_data_store()`. To be able to read out the data the next time the device reboots, the model's `bt_mesh_model_cb.settings_set` callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the `read_cb` passed as a parameter to the callback. See the [Settings](#) module documentation for details.

## API reference

group `bt_mesh_access`

Access layer.

Maximum possible payload size of an outgoing access message (in octets).

BT\_MESH\_RX\_SDU\_MAX

Maximum possible payload size of an incoming access message (in octets).

BT\_MESH\_ELEM(\_loc, \_mods, \_vnd\_mods)

Helper to define a mesh element within an array.

In case the element has no SIG or Vendor models the helper macro BT\_MESH\_MODEL\_NONE can be given instead.

**Parameters**

- `_loc` – Location Descriptor.
- `_mods` – Array of models.
- `_vnd_mods` – Array of vendor models.

BT\_MESH\_LEN\_EXACT(len)

Macro for encoding exact message length for fixed-length messages.

BT\_MESH\_LEN\_MIN(len)

Macro for encoding minimum message length for variable-length messages.

BT\_MESH\_MODEL\_OP\_END

End of the opcode list. Must always be present.

BT\_MESH\_MODEL\_NO\_OPS

Helper to define an empty opcode list.

BT\_MESH\_MODEL\_NONE

Helper to define an empty model array

BT\_MESH\_MODEL\_CB(\_id, \_op, \_pub, \_user\_data, \_cb)

Composition data SIG model entry with callback functions.

#### Parameters

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_cb` – Callback structure, or NULL to keep no callbacks.

BT\_MESH\_MODEL\_VND\_CB(\_company, \_id, \_op, \_pub, \_user\_data, \_cb)

Composition data vendor model entry with callback functions.

#### Parameters

- `_company` – Company ID.
- `_id` – Model ID.

- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_cb` – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL(_id, _op, _pub, _user_data)`

Composition data SIG model entry.

**Parameters**

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.

`BT_MESH_MODEL_VND(_company, _id, _op, _pub, _user_data)`

Composition data vendor model entry.

**Parameters**

- `_company` – Company ID.
- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.

`BT_MESH_TRANSMIT(count, int_ms)`

Encode transmission count & interval steps.

**Parameters**

- `count` – Number of retransmissions (first transmission is excluded).
- `int_ms` – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

**Returns** Mesh transmit value that can be used e.g. for the default values of the configuration model data.

`BT_MESH_TRANSMIT_COUNT(transmit)`

Decode transmit count from a transmit value.

**Parameters**

- `transmit` – Encoded transmit count & interval value.

**Returns** Transmission count (actual transmissions is  $N + 1$ ).

`BT_MESH_TRANSMIT_INT(transmit)`

Decode transmit interval from a transmit value.

**Parameters**

- `transmit` – Encoded transmit count & interval value.

**Returns** Transmission interval in milliseconds.

`BT_MESH_PUB_TRANSMIT(count, int_ms)`

Encode Publish Retransmit count & interval steps.

**Parameters**

- `count` – Number of retransmissions (first transmission is excluded).

- `int_ms` – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns** Mesh transmit value that can be used e.g. for the default values of the configuration model data.

`BT_MESH_PUB_TRANSMIT_COUNT(transmit)`

Decode Publish Retransmit count from a given value.

**Parameters**

- `transmit` – Encoded Publish Retransmit count & interval value.

**Returns** Retransmission count (actual transmissions is  $N + 1$ ).

`BT_MESH_PUB_TRANSMIT_INT(transmit)`

Decode Publish Retransmit interval from a given value.

**Parameters**

- `transmit` – Encoded Publish Retransmit count & interval value.

**Returns** Transmission interval in milliseconds.

`BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)`

Define a model publication context.

**Parameters**

- `_name` – Variable name given to the context.
- `_update` – Optional message update callback (may be NULL).
- `_msg_len` – Length of the publication message.

`BT_MESH_TTL_DEFAULT`

Special TTL value to request using configured default TTL

`BT_MESH_TTL_MAX`

Maximum allowed TTL value

## Functions

`int bt_mesh_model_send(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct net_buf_simple *msg, const struct bt_mesh_send_cb *cb, void *cb_data)`

Send an Access Layer message.

**Parameters**

- `model` – Mesh (client) Model that the message belongs to.
- `ctx` – Message context, includes keys, TTL, etc.
- `msg` – Access Layer payload (the actual message to be sent).
- `cb` – Optional “message sent” callback.
- `cb_data` – User data to be passed to the callback.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_model_publish(struct bt_mesh_model *model)
```

Send a model publication message.

Before calling this function, the user needs to ensure that the model publication message (*bt\_mesh\_model\_pub::msg*) contains a valid message to be sent. Note that this API is only to be used for non-period publishing. For periodic publishing the app only needs to make sure that *bt\_mesh\_model\_pub::msg* contains a valid message whenever the *bt\_mesh\_model\_pub::update* callback is called.

#### Parameters

- *model* – Mesh (client) Model that's publishing the message.

**Returns** 0 on success, or (negative) error code on failure.

```
struct bt_mesh_elem *bt_mesh_model_elem(struct bt_mesh_model *mod)
```

Get the element that a model belongs to.

#### Parameters

- *mod* – Mesh model.

**Returns** Pointer to the element that the given model belongs to.

```
struct bt_mesh_model *bt_mesh_model_find(const struct bt_mesh_elem *elem, uint16_t id)
```

Find a SIG model.

#### Parameters

- *elem* – Element to search for the model in.
- *id* – Model ID of the model.

**Returns** A pointer to the Mesh model matching the given parameters, or NULL if no SIG model with the given ID exists in the given element.

```
struct bt_mesh_model *bt_mesh_model_find_vnd(const struct bt_mesh_elem *elem, uint16_t  
company, uint16_t id)
```

Find a vendor model.

#### Parameters

- *elem* – Element to search for the model in.
- *company* – Company ID of the model.
- *id* – Model ID of the model.

**Returns** A pointer to the Mesh model matching the given parameters, or NULL if no vendor model with the given ID exists in the given element.

```
static inline bool bt_mesh_model_in_primary(const struct bt_mesh_model *mod)
```

Get whether the model is in the primary element of the device.

#### Parameters

- *mod* – Mesh model.

**Returns** true if the model is on the primary element, false otherwise.

```
int bt_mesh_model_data_store(struct bt_mesh_model *mod, bool vnd, const char *name, const  
void *data, size_t data_len)
```

Immediately store the model's user data in persistent storage.

#### Parameters

- *mod* – Mesh model.
- *vnd* – This is a vendor model.

- `name` – Name/key of the settings item. Only `SETTINGS_MAX_DIR_DEPTH` bytes will be used at most.
- `data` – Model data to store, or NULL to delete any model data.
- `data_len` – Length of the model data.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_model_extend(struct bt_mesh_model *extending_mod, struct bt_mesh_model
                        *base_mod)
```

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, ie a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.

All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

#### Parameters

- `extending_mod` – Mesh model that is extending the base model.
- `base_mod` – The model being extended.

**Return values** 0 – Successfully extended the `base_mod` model.

```
bool bt_mesh_model_is_extended(struct bt_mesh_model *model)
```

Check if model is extended by another model.

#### Parameters

- `model` – The model to check.

**Return values** `true` – If model is extended by another model, otherwise `false`

```
struct bt_mesh_elem
```

*#include <access.h>* Abstraction that describes a Mesh Element

#### Public Members

```
uint16_t addr
```

Unicast Address. Set at runtime during provisioning.

```
const uint16_t loc
```

Location Descriptor (GATT Bluetooth Namespace Descriptors)

```
const uint8_t model_count
```

The number of SIG models in this element

```
const uint8_t vnd_model_count
```

The number of vendor models in this element

```
struct bt_mesh_model *const models
```

The list of SIG models in this element

```
struct bt_mesh_model *const vnd_models
```

The list of vendor models in this element

```
struct bt_mesh_model_op
```

*#include <access.h>* Model opcode handler.

### Public Members

```
const uint32_t opcode
```

OpCode encoded using the BT\_MESH\_MODEL\_OP\_\* macros

```
const ssize_t len
```

Message length. If the message has variable length then this value indicates minimum message length and should be positive. Handler function should verify precise length based on the contents of the message. If the message has fixed length then this value should be negative. Use BT\_MESH\_LEN\_\* macros when defining this value.

```
int (*const func)(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct  
net_buf_simple *buf)
```

Handler function for this opcode.

**Param model** Model instance receiving the message.

**Param ctx** Message context for the message.

**Param buf** Message buffer containing the message payload, not including the opcode.

**Return** Zero on success or (negative) error code otherwise.

```
struct bt_mesh_model_pub
```

*#include <access.h>* Model publication context.

The context should primarily be created using the BT\_MESH\_MODEL\_PUB\_DEFINE macro.

### Public Members

```
struct bt_mesh_model *mod
```

The model the context belongs to. Initialized by the stack.

```
uint16_t addr
```

Publish Address.

```
uint16_t key
```

Publish AppKey Index.

```
uint16_t cred
```

Friendship Credentials Flag.

```
uint16_t send_rel
```

Force reliable sending (segment acks)

uint16\_t fast\_period

Use FastPeriodDivisor

uint8\_t ttl

Publish Time to Live.

uint8\_t retransmit

Retransmit Count & Interval Steps.

uint8\_t period

Publish Period.

uint8\_t period\_div

Divisor for the Period.

uint8\_t count

Transmissions left.

uint32\_t period\_start

Start of the current period.

struct *net\_buf\_simple* \*msg

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the BT\_MESH\_MODEL\_PUB\_DEFINE macro.

```
BT_MESH_MODEL_PUB_DEFINE(name, update, size);
```

int (\*update)(struct *bt\_mesh\_model* \*mod)

Callback for updating the publication buffer.

When set to NULL, the model is assumed not to support periodic publishing. When set to non-NULL the callback will be called periodically and is expected to update *bt\_mesh\_model\_pub::msg* with a valid publication message.

If the callback returns non-zero, the publication is skipped and will resume on the next periodic publishing interval.

**Param mod** The Model the Publication Context belongs to.

**Return** Zero on success or (negative) error code otherwise.

struct *k\_work\_delayable* timer

Publish Period Timer. Only for stack-internal use.

struct bt\_mesh\_model\_cb

#include <access.h> Model callback functions.

## Public Members

int (\*const settings\_set)(struct *bt\_mesh\_model* \*model, const char \*name, size\_t len\_rd, *settings\_read\_cb* read\_cb, void \*cb\_arg)

Set value handler of user data tied to the model.

**See also:**

[\*settings\\_handler::h\\_set\*](#)

**Param model** Model to set the persistent data of.

**Param name** Name/key of the settings item.

**Param len\_rd** The size of the data found in the backend.

**Param read\_cb** Function provided to read the data from the backend.

**Param cb\_arg** Arguments for the read function provided by the backend.

**Return** 0 on success, error otherwise.

int (\*const start)(struct [\*bt\\_mesh\\_model\*](#) \*model)

Callback called when the mesh is started.

This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.

When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.

**Param model** Model this callback belongs to.

**Return** 0 on success, error otherwise.

int (\*const init)(struct [\*bt\\_mesh\\_model\*](#) \*model)

Model init callback.

Called on every model instance during mesh initialization.

If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of [\*bt\\_mesh\\_init\*](#).

**Param model** Model to be initialized.

**Return** 0 on success, error otherwise.

void (\*const reset)(struct [\*bt\\_mesh\\_model\*](#) \*model)

Model reset callback.

Called when the mesh node is reset. All model data is deleted on reset, and the model should clear its state.

---

**Note:** If the model stores any persistent data, this needs to be erased manually.

---

**Param model** Model this callback belongs to.

struct [\*bt\\_mesh\\_mod\\_id\\_vnd\*](#)

*#include <access.h>* Vendor model ID

## Public Members

uint16\_t company

Vendor's company ID

uint16\_t id

Model ID

```
struct bt_mesh_model

```

*#include <access.h>* Callback structure for monitoring model message sending

### Public Members

```
void (*start)(uint16_t duration, int err, void *cb_data)
```

Handler called at the start of the transmission.

**Param duration** The duration of the full transmission.

**Param err** Error occurring during sending.

**Param cb\_data** Callback data, as passed to the send API.

```
void (*end)(int err, void *cb_data)
```

Handler called at the end of the transmission.

**Param err** Error occurring during sending.

**Param cb\_data** Callback data, as passed to the send API.

```
struct bt_mesh_comp
```

*#include <access.h>* Node Composition

## Public Members

`uint16_t cid`  
Company ID

`uint16_t pid`  
Product ID

`uint16_t vid`  
Version ID

`size_t elem_count`  
The number of elements in this device.

`struct bt\_mesh\_elem *elem`  
List of elements.

## Foundation models

The Bluetooth mesh specification defines four foundation models that can be used by network administrators to configure and diagnose mesh nodes.

**Configuration Server** The Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a [Configuration Client](#) to control it.

**..note::** The `bt_mesh_cfg_srv` structure has been deprecated. The initial values of the Relay, Beacon, Friend, Network transmit and Relay retransmit should be set through Kconfig, and the Heartbeat feature should be controlled through the [Heartbeat](#) API.

The Configuration Server model is mandatory on all Bluetooth mesh nodes, and should be instantiated in the first element.

## API reference

`group bt_mesh_cfg_srv`  
Configuration Server Model.

## Defines

`BT_MESH_MODEL_CFG_SRV`  
Generic Configuration Server model composition data entry.

**Configuration Client** The Configuration Client model is a foundation model defined by the Bluetooth mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a [Configuration Server](#) model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Configuration Client model is optional, but should be instantiated on the first element if it is present in the composition data.

## API reference

`group bt_mesh_cfg_cli`

Configuration Client Model.

### Defines

`BT_MESH_MODEL_CFG_CLI(cli_data)`

Generic Configuration Client model composition data entry.

#### Parameters

- `cli_data` – Pointer to a [Configuration Client Model](#) instance.

`BT_MESH_PUB_PERIOD_100MS(steps)`

Helper macro to encode model publication period in units of 100ms.

#### Parameters

- `steps` – Number of 100ms steps.

**Returns** Encoded value that can be assigned to [bt\\_mesh\\_cfg\\_mod\\_pub.period](#)

`BT_MESH_PUB_PERIOD_SEC(steps)`

Helper macro to encode model publication period in units of 1 second.

#### Parameters

- `steps` – Number of 1 second steps.

**Returns** Encoded value that can be assigned to [bt\\_mesh\\_cfg\\_mod\\_pub.period](#)

`BT_MESH_PUB_PERIOD_10SEC(steps)`

Helper macro to encode model publication period in units of 10 seconds.

#### Parameters

- `steps` – Number of 10 second steps.

**Returns** Encoded value that can be assigned to [bt\\_mesh\\_cfg\\_mod\\_pub.period](#)

`BT_MESH_PUB_PERIOD_10MIN(steps)`

Helper macro to encode model publication period in units of 10 minutes.

#### Parameters

- `steps` – Number of 10 minute steps.

**Returns** Encoded value that can be assigned to [bt\\_mesh\\_cfg\\_mod\\_pub.period](#)

### Functions

`int bt_mesh_cfg_node_reset(uint16_t net_idx, uint16_t addr, bool *status)`

Reset the target node and remove it from the network.

#### Parameters

- `net_idx` – Network index to encrypt with.

- `addr` – Target node address.
- `status` – Status response parameter

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp,  
                             struct net\_buf\_simple *comp)
```

Get the target node's composition data.

If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in `rsp`.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `page` – Composition data page, or 0xff to request the first available page.
- `rsp` – Return parameter for the returned page number, or NULL.
- `comp` – Composition data buffer to fill.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's network beacon state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter, returns one of [BT\\_MESH\\_BEACON\\_DISABLED](#) or [BT\\_MESH\\_BEACON\\_ENABLED](#) on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status,  
                       uint8_t *phase)
```

Get the target node's network key refresh phase state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `status` – Status response parameter.
- `phase` – Pointer to the Key Refresh variable to fill.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t  
                       transition, uint8_t *status, uint8_t *phase)
```

Set the target node's network key refresh phase parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.

- `transition` – Transition parameter.
- `status` – Status response parameter.
- `phase` – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's network beacon state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New network beacon state, should be one of [`BT\_MESH\_BEACON\_DISABLED`](#) or [`BT\_MESH\_BEACON\_ENABLED`](#).
- `status` – Status response parameter. Returns one of [`BT\_MESH\_BEACON\_DISABLED`](#) or [`BT\_MESH\_BEACON\_ENABLED`](#) on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node's Time To Live value.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `ttl` – TTL response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```

Set the target node's Time To Live value.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Time To Live value.
- `ttl` – TTL response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Friend feature status.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter. Returns one of [`BT\_MESH\_FRIEND\_DISABLED`](#), [`BT\_MESH\_FRIEND\_ENABLED`](#) or [`BT\_MESH\_FRIEND\_NOT\_SUPPORTED`](#) on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Friend feature state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Friend feature state. Should be one of `BT_MESH_FRIEND_DISABLED` or `BT_MESH_FRIEND_ENABLED`.
- `status` – Status response parameter. Returns one of `BT_MESH_FRIEND_DISABLED`, `BT_MESH_FRIEND_ENABLED` or `BT_MESH_FRIEND_NOT_SUPPORTED` on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Proxy feature state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Proxy feature state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Proxy feature state. Must be one of `BT_MESH_GATT_PROXY_DISABLED` or `BT_MESH_GATT_PROXY_ENABLED`.
- `status` – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
```

Get the target node's network\_transmit state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `transmit` – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT`.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t
                                *transmit)
```

Set the target node's network transmit parameters.

**See also:**

[BT\\_MESH\\_TRANSMIT](#).

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New encoded network transmit parameters.
- `transmit` – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with [BT\\_MESH\\_TRANSMIT\\_COUNT](#) and [BT\\_MESH\\_TRANSMIT\\_INT](#).

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)
```

Get the target node's Relay feature state.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter. Returns one of [BT\\_MESH\\_RELAY\\_DISABLED](#), [BT\\_MESH\\_RELAY\\_ENABLED](#) or [BT\\_MESH\\_RELAY\\_NOT\\_SUPPORTED](#) on success.
- `transmit` – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with [BT\\_MESH\\_TRANSMIT\\_COUNT](#) and [BT\\_MESH\\_TRANSMIT\\_INT](#).

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_relay_set(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t
                          new_transmit, uint8_t *status, uint8_t *transmit)
```

Set the target node's Relay parameters.

**See also:**

[BT\\_MESH\\_TRANSMIT](#).

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_relay` – New relay state. Must be one of [BT\\_MESH\\_RELAY\\_DISABLED](#) or [BT\\_MESH\\_RELAY\\_ENABLED](#).
- `new_transmit` – New encoded relay transmit parameters.
- `status` – Status response parameter. Returns one of [BT\\_MESH\\_RELAY\\_DISABLED](#), [BT\\_MESH\\_RELAY\\_ENABLED](#) or [BT\\_MESH\\_RELAY\\_NOT\\_SUPPORTED](#) on success.

- `transmit` – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT`.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const
                           uint8_t net_key[16], uint8_t *status)
```

Add a network key to the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_key_get(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)
```

Get a list of the target node's network key indexes.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `keys` – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
- `key_cnt` – Net key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned network key indexes upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t
                           *status)
```

Delete a network key from the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t
                           key_app_idx, const uint8_t app_key[16], uint8_t *status)
```

Add an application key to the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.

- `app_key` – Application key.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t
                           *status, uint16_t *keys, size_t *key_cnt)
```

Get a list of the target node's application key indexes for a specific network key.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index to request the app key indexes of.
- `status` – Status response parameter.
- `keys` – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `key_cnt` – App key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned application key indexes upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t
                           key_app_idx, uint8_t *status)
```

Delete an application key from the target node.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                             mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Bind an application to a SIG model on the target node.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to bind.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                               mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Unbind an application from a SIG model on the target node.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to unbind.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,  
                                uint8_t *status)
```

Bind an application to a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to bind.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                   uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,  
                                   uint8_t *status)
```

Unbind an application from a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to unbind.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t  
                           mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a SIG model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.

- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t
                                *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                             mod_id, struct bt\_mesh\_cfg\_mod\_pub *pub, uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint16_t cid, struct bt\_mesh\_cfg\_mod\_pub
                                 *pub, uint8_t *status)
```

Get publish parameters for a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.

- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                           mod_id, struct bt_mesh_cfg_mod_pub *pub, uint8_t *status)
```

Set publish parameters for a SIG model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `pub` – Publication parameters.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_mod_pub
                                *pub, uint8_t *status)
```

Set publish parameters for a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `pub` – Publication parameters.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                           sub_addr, uint16_t mod_id, uint8_t *status)
```

Add a group address to a SIG model's subscription list.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                               uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t
                               *status)
```

Add a group address to a vendor model's subscription list.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                           sub_addr, uint16_t mod_id, uint8_t *status)
```

Delete a group address in a SIG model's subscription list.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t
                                *status)
```

Delete a group address in a vendor model's subscription list.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                  uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                     uint16_t sub_addr, uint16_t mod_id, uint16_t cid,  
                                     uint8_t *status)
```

Overwrite all addresses in a vendor model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const  
                              uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr,  
                              uint8_t *status)
```

Add a virtual address to a SIG model's subscription list.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                   const uint8_t label[16], uint16_t mod_id, uint16_t cid,  
                                   uint16_t *virt_addr, uint8_t *status)
```

Add a virtual address to a vendor model's subscription list.

**Parameters**

- `net_idx` – Network index to encrypt with.

- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const
                               uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr,
                               uint8_t *status)
```

Delete a virtual address in a SIG model's subscription list.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address parameter to add to the subscription list.
- `mod_id` – Model ID.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                     const uint8_t label[16], uint16_t mod_id, uint16_t cid,
                                     uint16_t *virt_addr, uint8_t *status)
```

Delete a virtual address in a vendor model's subscription list.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                       const uint8_t label[16], uint16_t mod_id, uint16_t
                                       *virt_addr, uint8_t *status)
```

Overwrite all addresses in a SIG model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_va_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t
                                         elem_addr, const uint8_t label[16], uint16_t
                                         mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t
                                         *status)
```

Overwrite all addresses in a vendor model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
                           mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a SIG model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.
- `subs` – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- `sub_cnt` – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t
                                *subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `subs` – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- `sub_cnt` – Subscription list element count. Should be set to the capacity of the `subs` list when calling. Will return the number of returned subscriptions upon success.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub,
                           uint8_t *status)
```

Set the target node's Heartbeat subscription parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `sub` – New Heartbeat subscription parameters.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub,
                           uint8_t *status)
```

Get the target node's Heartbeta subscription parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `sub` – Heartbeat subscription parameter return buffer.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_hb_pub
                           *pub, uint8_t *status)
```

Set the target node's Heartbeat publication parameters.

---

**Note:** The target node must already have received the specified network key.

---

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `pub` – New Heartbeat publication parameters.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_pub *pub,  
                           uint8_t *status)
```

Get the target node's Heartbeat publication parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `pub` – Heartbeat publication parameter return buffer.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                uint16_t mod_id, uint8_t *status)
```

Delete all group addresses in a SIG model's subscription list.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_sub_del_all_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,  
                                     uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Delete all group addresses in a vendor model's subscription list.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const  
                               uint8_t net_key[16], uint8_t *status)
```

Update a network key to the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.

- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_app_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                               uint16_t key_app_idx, const uint8_t app_key[16], uint8_t
                               *status)
```

Update an application key to the target node.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
- `status` – Status response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                  uint8_t new_identity, uint8_t *status, uint8_t *identity)
```

Set the Node Identity parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_identity` – New identity state. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                  uint8_t *status, uint8_t *identity)
```

Get the Node Identity parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr,
                               int32_t *polltimeout)
```

Get the Low Power Node Polltimeout parameters.

#### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `unicast_addr` – LPN unicast address.
- `polltimeout` – Polltimeout response parameter.

**Returns** 0 on success, or (negative) error code on failure.

```
int32_t bt_mesh_cfg_cli_timeout_get(void)
```

Get the current transmission timeout value.

**Returns** The configured transmission timeout in milliseconds.

```
void bt_mesh_cfg_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

#### Parameters

- `timeout` – The new transmission timeout.

```
int bt_mesh_comp_p0_get(struct bt_mesh_comp_p0 *comp, struct net_buf_simple *buf)
```

Create a composition data page 0 representation from a buffer.

The composition data page object will take ownership over the buffer, which should not be manipulated directly after this call.

This function can be used in combination with [bt\\_mesh\\_cfg\\_comp\\_data\\_get](#) to read out composition data page 0 from other devices:

```
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;

err = bt_mesh_cfg_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
    bt_mesh_comp_p0_get(&comp, &buf);
}
```

#### Parameters

- `buf` – Network buffer containing composition data.
- `comp` – Composition data structure to fill.

**Returns** 0 on success, or (negative) error code on failure.

```
struct bt_mesh_comp_p0_elem *bt_mesh_comp_p0_elem_pull(const struct bt_mesh_comp_p0
                                                         *comp, struct
                                                         bt_mesh_comp_p0_elem *elem)
```

Pull a composition data page 0 element from a composition data page 0 instance.

Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

#### Parameters

- `comp` – Composition data page
- `elem` – Element to fill.

**Returns** A pointer to `elem` on success, or NULL if no more elements could be pulled.

`uint16_t bt_mesh_comp_p0_elem_mod(struct bt_mesh_comp_p0_elem *elem, int idx)`

Get a SIG model from the given composition data page 0 element.

**Parameters**

- `elem` – Element to read the model from.
- `idx` – Index of the SIG model to read.

**Returns** The Model ID of the SIG model at the given index, or 0xffff if the index is out of bounds.

`struct bt_mesh_mod_id_vnd bt_mesh_comp_p0_elem_mod_vnd(struct bt_mesh_comp_p0_elem *elem, int idx)`

Get a vendor model from the given composition data page 0 element.

**Parameters**

- `elem` – Element to read the model from.
- `idx` – Index of the vendor model to read.

**Returns** The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

`struct bt_mesh_cfg_cli`

`#include <cfg_cli.h>` Mesh Configuration Client Model Context

**Public Members**

`struct bt_mesh_model *model`

Composition data model entry pointer.

`struct bt_mesh_cfg_mod_pub`

`#include <cfg_cli.h>` Model publication configuration parameters.

**Public Members**

`uint16_t addr`

Publication destination address.

`const uint8_t *uuid`

Virtual address UUID, or NULL if this is not a virtual address.

`uint16_t app_idx`

Application index to publish with.

`bool cred_flag`

Friendship credential flag.

`uint8_t ttl`

Time To Live to publish with.

uint8\_t period

Encoded publish period.

**See also:**

[\*BT\\_MESH\\_PUB\\_PERIOD\\_100MS\*](#), [\*BT\\_MESH\\_PUB\\_PERIOD\\_SEC\*](#),  
[\*BT\\_MESH\\_PUB\\_PERIOD\\_10SEC\*](#), [\*BT\\_MESH\\_PUB\\_PERIOD\\_10MIN\*](#)

uint8\_t transmit

Encoded transmit parameters.

**See also:**

[\*BT\\_MESH\\_TRANSMIT\*](#)

struct bt\_mesh\_cfg\_hb\_sub

*#include <cfg\_cli.h>* Heartbeat subscription configuration parameters.

### Public Members

uint16\_t src

Source address to receive Heartbeat messages from.

uint16\_t dst

Destination address to receive Heartbeat messages on.

uint8\_t period

Logarithmic subscription period to keep listening for. The decoded subscription period is  $(1 << (\text{period} - 1))$  seconds, or 0 seconds if period is 0.

uint8\_t count

Logarithmic Heartbeat subscription receive count. The decoded Heartbeat count is  $(1 << (\text{count} - 1))$  if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.

Ignored in Heartbeat subscription set.

uint8\_t min

Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

uint8\_t max

Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

struct bt\_mesh\_cfg\_hb\_pub

*#include <cfg\_cli.h>* Heartbeat publication configuration parameters.

## Public Members

`uint16_t dst`

Heartbeat destination address.

`uint8_t count`

Logarithmic Heartbeat count. Decoded as  $(1 \ll (\text{count} - 1))$  if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.

When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.

When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

`uint8_t period`

Logarithmic Heartbeat publication transmit interval in seconds. Decoded as  $(1 \ll (\text{period} - 1))$  if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.

`uint8_t ttl`

Publication message Time To Live value.

`uint16_t feat`

Bitmap of features that trigger Heartbeat publications. Legal values are [`BT\_MESH\_FEAT\_RELAY`](#), [`BT\_MESH\_FEAT\_PROXY`](#), [`BT\_MESH\_FEAT\_FRIEND`](#) and [`BT\_MESH\_FEAT\_LOW\_POWER`](#)

`uint16_t net_idx`

Network index to publish with.

`struct bt_mesh_comp_p0`

*#include <cfg\_cli.h>* Parsed Composition data page 0 representation.

Should be pulled from the return buffer passed to [`bt\_mesh\_cfg\_comp\_data\_get`](#) using [`bt\_mesh\_comp\_p0\_get`](#).

## Public Members

`uint16_t cid`

Company ID

`uint16_t pid`

Product ID

`uint16_t vid`

Version ID

`uint16_t crpl`

Replay protection list size

`uint16_t feat`

Supported features, see [BT\\_MESH\\_FEAT\\_SUPPORTED](#).

`struct bt_mesh_comp_p0_elem`

*#include <cfg\_cli.h>* Composition data page 0 element representation

### Public Members

`uint16_t loc`

Element location

`size_t nsig`

The number of SIG models in this element

`size_t nvnd`

The number of vendor models in this element

**Health Server** The Health Server model provides attention callbacks and node diagnostics for [Health Client](#) models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

**Faults** The Health Server model may report a list of faults that have occurred in the device's lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node's design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values 0x01 to 0x7f are reserved for the Bluetooth mesh specification, and the full list of specification defined faults are available in [Health faults](#). Fault values 0x80 to 0xff are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

**Attention state** The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they're provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: [bt\\_mesh\\_health\\_srv\\_cb.attn\\_on](#) is called at the beginning of the attention period, [bt\\_mesh\\_health\\_srv\\_cb.attn\\_off](#) is called at the end.

The remaining time for the attention period may be queried through [bt\\_mesh\\_health\\_srv.attn\\_timer](#).

### API reference

`group bt_mesh_health_srv`

Health Server Model.

## Defines

`BT_MESH_HEALTH_PUB_DEFINE(_name, _max_faults)`

A helper to define a health publication context

### Parameters

- `_name` – Name given to the publication context variable.
- `_max_faults` – Maximum number of faults the element can have.

`BT_MESH_MODEL_HEALTH_SRV(srv, pub)`

Define a new health server model. Note that this API needs to be repeated for each element that the application wants to have a health server model on. Each instance also needs a unique [bt\\_mesh\\_health\\_srv](#) and [bt\\_mesh\\_model\\_pub](#) context.

### Parameters

- `srv` – Pointer to a unique struct [bt\\_mesh\\_health\\_srv](#).
- `pub` – Pointer to a unique struct [bt\\_mesh\\_model\\_pub](#).

**Returns** New mesh model instance.

## Functions

`int bt_mesh_fault_update(struct bt\_mesh\_elem *elem)`

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

### Parameters

- `elem` – Element to update the fault state of.

**Returns** 0 on success, or (negative) error code otherwise.

`struct bt_mesh_health_srv_cb`

*#include <health\_srv.h>* Callback function for the Health Server model

## Public Members

`int (*fault_get_cur)(struct bt\_mesh\_model *model, uint8_t *test_id, uint16_t *company_id, uint8_t *faults, uint8_t *fault_count)`

Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

All faults shall be associated with at least one Company ID, representing the device vendor or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated with one of them at the time. To report faults for multiple Company IDs, interleave which Company ID is reported for each call.

**Param model** Health Server model instance to get faults of.

**Param test\_id** Test ID response buffer.

**Param company\_id** Company ID response buffer.

**Param faults** Array to fill with current faults.

**Param fault\_count** The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return** 0 on success, or (negative) error code otherwise.

```
int (*fault_get_reg)(struct bt_mesh_model *model, uint16_t company_id, uint8_t *test_id,
uint8_t *faults, uint8_t *fault_count)
```

Callback for fetching all registered faults.

Registered faults are all past and current faults since the last call to `fault_clear`. Only faults associated with the given Company ID should be reported.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

**Param model** Health Server model instance to get faults of.

**Param company\_id** Company ID to get faults for.

**Param test\_id** Test ID response buffer.

**Param faults** Array to fill with registered faults.

**Param fault\_count** The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return** 0 on success, or (negative) error code otherwise.

```
int (*fault_clear)(struct bt_mesh_model *model, uint16_t company_id)
```

Clear all registered faults associated with the given Company ID.

**Param model** Health Server model instance to clear faults of.

**Param company\_id** Company ID to clear faults for.

**Return** 0 on success, or (negative) error code otherwise.

```
int (*fault_test)(struct bt_mesh_model *model, uint8_t test_id, uint16_t company_id)
```

Run a self-test.

The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

**Param model** Health Server model instance to run test for.

**Param test\_id** Test ID to run.

**Param company\_id** Company ID to run test for.

**Return** 0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn't start.

```
void (*attn_on)(struct bt_mesh_model *model)
```

Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the `attn_off` callback is called.

**Param model** Health Server model to start the attention state of.

```
void (*attn_off)(struct bt_mesh_model *model)
```

Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

**Param model**

```
struct bt_mesh_health_srv
    #include <health_srv.h> Mesh Health Server Model Context
```

### Public Members

```
struct bt_mesh_model *model
    Composition data model entry pointer.

const struct bt_mesh_health_srv_cb *cb
    Optional callback struct

struct k_work_delayable attn_timer
    Attention Timer state
```

**Health faults** Fault values defined by the Bluetooth mesh specification.

```
group bt_mesh_health_faults
    List of specification defined Health fault values.
```

### Defines

BT\_MESH\_HEALTH\_FAULT\_VENDOR\_SPECIFIC\_START

Start of the vendor specific fault values.

All values below this are reserved for the Bluetooth Specification.

**Health Client** The Health Client model interacts with a Health Server model to read out diagnostics and control the node's attention state.

All message passing functions in the Health Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Health Client model is optional, and may be instantiated in any element. However, if a Health Client model is instantiated in an element other than the first, an instance must also be present in the first element.

See [Health faults](#) for a list of specification defined fault values.

## API reference

group `bt_mesh_health_cli`  
Health Client Model.

### Defines

`BT_MESH_MODEL_HEALTH_CLI(cli_data)`  
Generic Health Client model composition data entry.

#### Parameters

- `cli_data` – Pointer to a [Health Client Model](#) instance.

### Functions

`int bt_mesh_health_cli_set(struct bt\_mesh\_model *model)`  
Set Health client model instance to use for communication.

#### Parameters

- `model` – Health Client model instance from the composition data.

**Returns** 0 on success, or (negative) error code on failure.

`int bt_mesh_health_fault_get(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)`  
Get the registered fault state for the given Company ID.

#### See also:

[Health faults](#)

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `cid` – Company ID to get the registered faults of.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

**Returns** 0 on success, or (negative) error code on failure.

`int bt_mesh_health_fault_clear(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)`  
Clear the registered faults for the given Company ID.

#### See also:

[Health faults](#)

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.

- `cid` – Company ID to clear the registered faults for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_health_fault_test(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t test_id,
                             uint8_t *faults, size_t *fault_count)
```

Invoke a self-test procedure for the given Company ID.

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `cid` – Company ID to invoke the test for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_health_period_get(uint16_t addr, uint16_t app_idx, uint8_t *divisor)
```

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by ( $1 \ll \text{divisor}$ ). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `divisor` – Health period divisor response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_health_period_set(uint16_t addr, uint16_t app_idx, uint8_t divisor, uint8_t
                             *updated_divisor)
```

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by ( $1 \ll \text{divisor}$ ). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `divisor` – New Health period divisor.
- `updated_divisor` – Health period divisor response buffer.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_health_attention_get(uint16_t addr, uint16_t app_idx, uint8_t *attention)
```

Get the current attention timer value.

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `attention` – Attention timer response buffer, measured in seconds.

**Returns** 0 on success, or (negative) error code on failure.

```
int bt_mesh_health_attention_set(uint16_t addr, uint16_t app_idx, uint8_t attention, uint8_t
                                *updated_attention)
```

Set the attention timer.

#### Parameters

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `attention` – New attention timer time, in seconds.
- `updated_attention` – Attention timer response buffer, measured in seconds.

**Returns** 0 on success, or (negative) error code on failure.

```
int32_t bt_mesh_health_cli_timeout_get(void)
```

Get the current transmission timeout value.

**Returns** The configured transmission timeout in milliseconds.

```
void bt_mesh_health_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

#### Parameters

- `timeout` – The new transmission timeout.

```
struct bt_mesh_health_cli
```

*#include <health\_cli.h>* Health Client Model Context

### Public Members

```
struct bt\_mesh\_model *model
```

Composition data model entry pointer.

```
void (*current_status)(struct bt\_mesh\_health\_cli *cli, uint16_t addr, uint8_t test_id,
uint16_t cid, uint8_t *faults, size_t fault_count)
```

Optional callback for Health Current Status messages.

Handles received Health Current Status messages from a Health server. The `fault` array represents all faults that are currently present in the server's element.

**See also:**

[Health faults](#)

**Param `cli`** Health client that received the status message.

**Param `addr`** Address of the sender.

**Param test\_id** Identifier of a most recently performed test.  
**Param cid** Company Identifier of the node.  
**Param faults** Array of faults.  
**Param fault\_count** Number of faults in the fault array.

## Message

The Bluetooth mesh message provides set of structures, macros and functions used for preparing message buffers, managing message and acknowledged message contexts.

## API reference

*group* `bt_mesh_msg`

Message.

## Defines

`BT_MESH_MIC_SHORT`

Length of a short Mesh MIC.

`BT_MESH_MIC_LONG`

Length of a long Mesh MIC.

`BT_MESH_MODEL_OP_LEN(_op)`

Helper to determine the length of an opcode.

### Parameters

- `_op` – Opcode.

`BT_MESH_MODEL_BUF_LEN(_op, _payload_len)`

Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

### Parameters

- `_op` – Opcode of the message.
- `_payload_len` – Length of the model payload.

`BT_MESH_MODEL_BUF_LEN_LONG_MIC(_op, _payload_len)`

Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

### Parameters

- `_op` – Opcode of the message.
- `_payload_len` – Length of the model payload.

`BT_MESH_MODEL_BUF_DEFINE(_buf, _op, _payload_len)`

Define a Mesh model message buffer using [\*NET\\_BUF\\_SIMPLE\\_DEFINE\*](#).

### Parameters

- `_buf` – Buffer name.
- `_op` – Opcode of the message.

- `_payload_len` – Length of the model message payload.

## Functions

`void bt_mesh_model_msg_init(struct net\_buf\_simple *msg, uint32_t opcode)`

Initialize a model message.

Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

### Parameters

- `msg` – Message buffer.
- `opcode` – Opcode to encode.

`static inline void bt_mesh_msg_ack_ctx_init(struct bt\_mesh\_msg\_ack\_ctx *ack)`

Initialize an acknowledged message context.

Initializes semaphore used for synchronization between [bt\\_mesh\\_msg\\_ack\\_ctx\\_wait](#) and [bt\\_mesh\\_msg\\_ack\\_ctx\\_rx](#) calls. Call this function before using [bt\\_mesh\\_msg\\_ack\\_ctx](#).

### Parameters

- `ack` – Acknowledged message context to initialize.

`static inline void bt_mesh_msg_ack_ctx_reset(struct bt\_mesh\_msg\_ack\_ctx *ack)`

Reset the synchronization semaphore in an acknowledged message context.

This function aborts call to [bt\\_mesh\\_msg\\_ack\\_ctx\\_wait](#).

### Parameters

- `ack` – Acknowledged message context to be reset.

`void bt_mesh_msg_ack_ctx_clear(struct bt\_mesh\_msg\_ack\_ctx *ack)`

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by [bt\\_mesh\\_msg\\_ack\\_ctx\\_prepare](#).

### Parameters

- `ack` – Acknowledged message context to be cleared.

`int bt_mesh_msg_ack_ctx_prepare(struct bt\_mesh\_msg\_ack\_ctx *ack, uint32_t op, uint16_t dst, void *user_data)`

Prepare an acknowledged message context for the incoming message to wait.

This function sets the opcode, remote address of the incoming message and stores the user data. Use this function before calling [bt\\_mesh\\_msg\\_ack\\_ctx\\_wait](#).

### Parameters

- `ack` – Acknowledged message context to prepare.
- `op` – The message OpCode.
- `dst` – Destination address of the message.
- `user_data` – User data for the acknowledged message context.

**Returns** 0 on success, or (negative) error code on failure.

`static inline bool bt_mesh_msg_ack_ctx_busy(struct bt\_mesh\_msg\_ack\_ctx *ack)`

Check if the acknowledged message context is initialized with an opcode.

### Parameters

- `ack` – Acknowledged message context.

**Returns** true if the acknowledged message context is initialized with an opcode, false otherwise.

```
int bt_mesh_msg_ack_ctx_wait(struct bt_mesh_msg_ack_ctx *ack, k_timeout_t timeout)
```

Wait for a message acknowledged.

This function blocks execution until *bt\_mesh\_msg\_ack\_ctx\_rx* is called or by timeout.

#### Parameters

- `ack` – Acknowledged message context of the message to wait for.
- `timeout` – Wait timeout.

**Returns** 0 on success, or (negative) error code on failure.

```
static inline void bt_mesh_msg_ack_ctx_rx(struct bt_mesh_msg_ack_ctx *ack)
```

Mark a message as acknowledged.

This function unblocks call to *bt\_mesh\_msg\_ack\_ctx\_wait*.

#### Parameters

- `ack` – Context of a message to be acknowledged.

```
bool bt_mesh_msg_ack_ctx_match(const struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t  
                             addr, void **user_data)
```

Check if an opcode and address of a message matches the expected one.

#### Parameters

- `ack` – Acknowledged message context to be checked.
- `op` – OpCode of the incoming message.
- `addr` – Source address of the incoming message.
- `user_data` – If not NULL, returns a user data stored in the acknowledged message context by *bt\_mesh\_msg\_ack\_ctx\_prepare*.

**Returns** true if the incoming message matches the expected one, false otherwise.

```
struct bt_mesh_msg_ctx
```

*#include <msg.h>* Message sending context.

### Public Members

```
uint16_t net_idx
```

NetKey Index of the subnet to send the message on.

```
uint16_t app_idx
```

AppKey Index to encrypt the message with.

```
uint16_t addr
```

Remote address.

```
uint16_t recv_dst
```

Destination address of a received message. Not used for sending.

`int8_t recv_rssi`

RSSI of received packet. Not used for sending.

`uint8_t recv_ttl`

Received TTL value. Not used for sending.

`bool send_rel`

Force sending reliably by using segment acknowledgment

`uint8_t send_ttl`

TTL, or `BT_MESH_TTL_DEFAULT` for default TTL.

`struct bt_mesh_msg_ack_ctx`

*#include <msg.h>* Acknowledged message context for tracking the status of model messages pending a response.

### Public Members

`struct k_sem sem`

Sync semaphore.

`uint32_t op`

Opcode we're waiting for.

`uint16_t dst`

Address of the node that should respond.

`void *user_data`

User specific parameter.

## Provisioning

Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The *provisioner* represents the network owner, and is responsible for adding new nodes to the mesh network.
- The *provisionee* is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an *unprovisioned device*.

The Provisioning module in the Zephyr Bluetooth mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

**The Provisioning process** All Bluetooth mesh nodes must be provisioned before they can participate in a Bluetooth mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconsing
- Invitation

- Public key exchange
- Authentication
- Provisioning data transfer

**Beaconing** To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call `bt_mesh_prov_enable()`. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the OOB information field, as specified in the prov parameter passed to `bt_mesh_init()`. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

**Uniform Resource Identifier** The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special none scheme, encoded as 0x01. The available schemes are listed on the [Bluetooth website](#).

Examples of encoded URIs:

Table 2: URI encoding examples

URI	Encoded
<code>http://example.com</code>	<code>\x16//example.com</code>
<code>https://www.zephyrproject.org/</code>	<code>\x17//www.zephyrproject.org/</code>
<code>just a string</code>	<code>\x01just a string</code>

**Provisioning invitation** The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server [Attention state](#), if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods.

**Public key exchange** Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.

If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can't retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, **`CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY`** needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to `bt_mesh_prov.public_key_be` and `bt_mesh_prov.private_key_be`. The keys needs to be provided in big-endian bytes order.

To provide the device's public key obtained via OOB, call `bt_mesh_prov_remote_pub_key_set()` on the provisioner side.

**Authentication** After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB:** An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.
- **Input OOB:** The user inputs the authentication value. The available input actions are listed in `bt_mesh_input_action_t`.
- **Output OOB:** Show the user the authentication value. The available output actions are listed in `bt_mesh_output_action_t`.

The application must provide callbacks for the supported authentication methods in `bt_mesh_prov`, as well as enabling the supported actions in `bt_mesh_prov.output_actions` and `bt_mesh_prov.input_actions`.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the `bt_mesh_prov.input_complete` or `bt_mesh_prov.complete` callback is called. If the action is blink, beep or vibrate, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the `bt_mesh_prov.input` callback. The user response should be fed back to the Provisioning API through `bt_mesh_input_string()` or `bt_mesh_input_number()`. If no user response is recorded within 60 seconds, the Provisioning process is aborted.

**Data transfer** After the device has been successfully authenticated, the provisioner transfers the Provisioning data:

- Unicast address
- A network key
- IV index
- Network flags
  - Key refresh
  - IV update

Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning `bt_mesh_prov.complete` callback gets called.

**Provisioning security** Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI [disclosed](#) a set of vulnerabilities in the Bluetooth mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Mesh Profile specification [erratum 16350](#), as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

## API reference

group `bt_mesh_prov`

Provisioning.

## Enums

enum bt\_mesh\_output\_action\_t

Available Provisioning output authentication actions.

*Values:*

enumerator BT\_MESH\_NO\_OUTPUT = 0

enumerator BT\_MESH\_BLINK = *BIT*(0)

## Functions

int bt\_mesh\_input\_string(const char \*str)

Provide provisioning input OOB string.

This is intended to be called after the *bt\_mesh\_prov* input callback has been called with BT\_MESH\_ENTER\_STRING as the action.

### Parameters

- str – String.

**Returns** Zero on success or (negative) error code otherwise.

int bt\_mesh\_input\_number(uint32\_t num)

Provide provisioning input OOB number.

This is intended to be called after the *bt\_mesh\_prov* input callback has been called with BT\_MESH\_ENTER\_NUMBER as the action.

### Parameters

- num – Number.

**Returns** Zero on success or (negative) error code otherwise.

int bt\_mesh\_prov\_remote\_pub\_key\_set(const uint8\_t public\_key[64])

Provide Device public key.

### Parameters

- public\_key – Device public key in big-endian.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_input(bt_mesh_input_action_t action, uint8_t size)
```

Use Input OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Input OOB authentication action. When using *BT\_MESH\_PUSH*, *BT\_MESH\_TWIST* or *BT\_MESH\_ENTER\_NUMBER*, the *bt\_mesh\_prov::output\_number* callback is called with a random number that has to be entered on the unprovisioned device.

When using *BT\_MESH\_ENTER\_STRING*, the *bt\_mesh\_prov::output\_string* callback is called with a random string that has to be entered on the unprovisioned device.

#### Parameters

- *action* – Authentication action used by the unprovisioned device.
- *size* – Authentication size.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_output(bt_mesh_output_action_t action, uint8_t size)
```

Use Output OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Output OOB authentication action. The *bt\_mesh\_prov::input* callback will be called.

When using *BT\_MESH\_BLINK*, *BT\_MESH\_BEEP*, *BT\_MESH\_VIBRATE* or *BT\_MESH\_DISPLAY\_NUMBER*, and the application has to call *bt\_mesh\_input\_number* with the random number indicated by the unprovisioned device.

When using *BT\_MESH\_DISPLAY\_STRING*, the application has to call *bt\_mesh\_input\_string* with the random string displayed by the unprovisioned device.

#### Parameters

- *action* – Authentication action used by the unprovisioned device.
- *size* – Authentication size.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_static(const uint8_t *static_val, uint8_t size)
```

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

#### Parameters

- *static\_val* – Static OOB value.
- *size* – Static OOB value size.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_none(void)
```

Don't use OOB authentication.

Provisioner only.

Don't use any authentication when provisioning new devices. This is the default behavior.

**Warning:** Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_prov_enable(bt_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

#### Parameters

- *bearers* – Bit-wise or of provisioning bearers.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_prov_disable(bt_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

#### Parameters

- *bearers* – Bit-wise or of provisioning bearers.

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_provision(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t  
iv_index, uint16_t addr, const uint8_t dev_key[16])
```

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

#### Parameters

- *net\_key* – Network Key
- *net\_idx* – Network Key Index
- *flags* – Provisioning Flags
- *iv\_index* – IV Index
- *addr* – Primary element address
- *dev\_key* – Device Key

**Returns** Zero on success or (negative) error code otherwise.

```
int bt_mesh_provision_adv(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t  
attention_duration)
```

Provision a Mesh Node using PB-ADV.

#### Parameters

- *uuid* – UUID
- *net\_idx* – Network Key Index
- *addr* – Address to assign to remote device. If *addr* is 0, the lowest available address will be chosen.
- *attention\_duration* – The attention duration to be send to remote device

**Returns** Zero on success or (negative) error code otherwise.

```
bool bt_mesh_is_provisioned(void)
```

Check if the local node has been provisioned.

This API can be used to check if the local node has been provisioned or not. It can e.g. be helpful to determine if there was a stored network in flash, i.e. if the network was restored after calling [settings\\_load\(\)](#).

**Returns** True if the node is provisioned. False otherwise.

```
struct bt_mesh_dev_capabilities
```

*#include <main.h>* Device Capabilities.

### Public Members

```
uint8_t elem_count
```

Number of elements supported by the device

```
uint16_t algorithms
```

Supported algorithms and other capabilities

```
uint8_t pub_key_type
```

Supported public key types

```
uint8_t static_oob
```

Supported static OOB Types

```
bt\_mesh\_output\_action\_t output_actions
```

Supported Output OOB Actions

```
bt\_mesh\_input\_action\_t input_actions
```

Supported Input OOB Actions

```
uint8_t output_size
```

Maximum size of Output OOB supported

```
uint8_t input_size
```

Maximum size in octets of Input OOB supported

```
struct bt_mesh_prov
```

*#include <main.h>* Provisioning properties & capabilities.

### Public Members

```
const uint8_t *uuid
```

The UUID that's used when advertising as unprovisioned

```
const char *uri
```

Optional URI. This will be advertised separately from the unprovisioned beacon, however the unprovisioned beacon will contain a hash of it so the two can be associated by the provisioner.

*bt\_mesh\_prov\_oob\_info\_t* oob\_info

Out of Band information field.

const uint8\_t \*public\_key\_be

Pointer to Public Key in big-endian for OOB public key type support.

Remember to enable **:kconfig: `CONFIG\_BT\_MESH\_PROV\_OOB\_PUBLIC\_KEY`** when initializing this parameter.

Must be used together with *bt\_mesh\_prov::private\_key\_be*.

const uint8\_t \*private\_key\_be

Pointer to Private Key in big-endian for OOB public key type support.

Remember to enable **:kconfig: `CONFIG\_BT\_MESH\_PROV\_OOB\_PUBLIC\_KEY`** when initializing this parameter.

Must be used together with *bt\_mesh\_prov::public\_key\_be*.

const uint8\_t \*static\_val

Static OOB value

uint8\_t static\_val\_len

Static OOB value length

uint8\_t output\_size

Maximum size of Output OOB supported

uint16\_t output\_actions

Supported Output OOB Actions

uint8\_t input\_size

Maximum size of Input OOB supported

uint16\_t input\_actions

Supported Input OOB Actions

void (\*capabilities)(const struct *bt\_mesh\_dev\_capabilities* \*cap)

Provisioning Capabilities.

This callback notifies the application that the provisioning capabilities of the unprovisioned device has been received.

The application can consequently call *bt\_mesh\_auth\_method\_set\_<\*>* to select suitable provisioning oob authentication method.

When this callback returns, the provisioner will start authentication with the chosen method.

**Param cap** capabilities supported by device.

int (\*output\_number)(*bt\_mesh\_output\_action\_t* act, uint32\_t num)

Output of a number is requested.

This callback notifies the application that it should output the given number using the given action.

**Param act** Action for outputting the number.

**Param num** Number to be outputted.

**Return** Zero on success or negative error code otherwise

int (\*output\_string)(const char \*str)

Output of a string is requested.

This callback notifies the application that it should display the given string to the user.

**Param str** String to be displayed.

**Return** Zero on success or negative error code otherwise

int (\*input)([bt\\_mesh\\_input\\_action\\_t](#) act, uint8\_t size)

Input is requested.

This callback notifies the application that it should request input from the user using the given action. The requested input will either be a string or a number, and the application needs to consequently call the [bt\\_mesh\\_input\\_string\(\)](#) or [bt\\_mesh\\_input\\_number\(\)](#) functions once the data has been acquired from the user.

**Param act** Action for inputting data.

**Param num** Maximum size of the inputted data.

**Return** Zero on success or negative error code otherwise

void (\*input\_complete)(void)

The other device finished their OOB input.

This callback notifies the application that it should stop displaying its output OOB value, as the other party finished their OOB input.

void (\*unprovisioned\_beacon)(uint8\_t uuid[16], [bt\\_mesh\\_prov\\_oob\\_info\\_t](#) oob\_info, uint32\_t \*uri\_hash)

Unprovisioned beacon has been received.

This callback notifies the application that an unprovisioned beacon has been received.

**Param uuid** UUID

**Param oob\_info** OOB Information

**Param uri\_hash** Pointer to URI Hash value. NULL if no hash was present in the beacon.

void (\*link\_open)([bt\\_mesh\\_prov\\_bearer\\_t](#) bearer)

Provisioning link has been opened.

This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

**Param bearer** Provisioning bearer.

void (\*link\_close)([bt\\_mesh\\_prov\\_bearer\\_t](#) bearer)

Provisioning link has been closed.

This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

**Param bearer** Provisioning bearer.

void (\*complete)(uint16\_t net\_idx, uint16\_t addr)

Provisioning is complete.

This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

**Param net\_idx** NetKeyIndex given during provisioning.

**Param addr** Primary element address.

```
void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)
```

A new node has been added to the provisioning database.

This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

**Param net\_idx** NetKeyIndex given during provisioning.

**Param uuid** UUID of the added node

**Param addr** Primary element address.

**Param num\_elem** Number of elements that this node has.

```
void (*reset)(void)
```

Node has been reset.

This callback notifies the application that the local node has been reset and needs to be reprovisioned. The node will not automatically advertise as unprovisioned, rather the [bt\\_mesh\\_prov\\_enable\(\)](#) API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

## Proxy

The Proxy feature allows legacy devices like phones to access the Bluetooth mesh network through GATT. The Proxy feature is only compiled in if the `:kconfig: CONFIG_BT_MESH_GATT_PROXY` option is set. The Proxy feature state is controlled by the [Configuration Server](#), and the initial value can be set with `bt_mesh_cfg_srv.gatt_proxy`.

## API reference

*group* `bt_mesh_proxy`

Proxy.

## Defines

```
BT_MESH_PROXY_CB_DEFINE(_name)
```

Register a callback structure for Proxy events.

Registers a structure with callback functions that gets called on various Proxy events.

### Parameters

- `_name` – Name of callback structure.

## Functions

```
int bt_mesh_proxy_identity_enable(void)
```

Enable advertising with Node Identity.

This API requires that GATT Proxy support has been enabled. Once called each subnet will start advertising using Node Identity for the next 60 seconds.

**Returns** 0 on success, or (negative) error code on failure.

```
struct bt_mesh_proxy_cb
```

*#include <proxy.h>* Callbacks for the Proxy feature.

Should be instantiated with [BT\\_MESH\\_PROXY\\_CB\\_DEFINE](#).

### Public Members

```
void (*identity_enabled)(uint16_t net_idx)
```

Started sending Node Identity beacons on the given subnet.

**Param net\_idx** Network index the Node Identity beacons are running on.

```
void (*identity_disabled)(uint16_t net_idx)
```

Stopped sending Node Identity beacons on the given subnet.

**Param net\_idx** Network index the Node Identity beacons were running on.

## Heartbeat

The Heartbeat feature provides functionality for monitoring Bluetooth mesh nodes and determining the distance between nodes.

The Heartbeat feature is configured through the [Configuration Server](#) model.

**Heartbeat messages** Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.

Available Heartbeat feature flags:

- [BT\\_MESH\\_FEAT\\_RELAY](#)
- [BT\\_MESH\\_FEAT\\_PROXY](#)
- [BT\\_MESH\\_FEAT\\_FRIEND](#)
- [BT\\_MESH\\_FEAT\\_LOW\\_POWER](#)

**Heartbeat publication** Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:

**Periodic publication** The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

**Triggered publication** The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.

The two publication types can be combined.

**Heartbeat subscription** A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the `bt_mesh_hb_cb::recv` event handler.

When the Heartbeat subscription period ends, the `bt_mesh_hb_cb::sub_end` callback gets called.

## API reference

group `bt_mesh_heartbeat`  
Heartbeat.

### Defines

`BT_MESH_HB_CB_DEFINE(_name)`

Register a callback structure for Heartbeat events.

Registers a callback structure that will be called whenever Heartbeat events occur

#### Parameters

- `_name` – Name of callback structure.

### Functions

`void bt_mesh_hb_pub_get(struct bt_mesh_hb_pub *get)`

Get the current Heartbeat publication parameters.

#### Parameters

- `get` – Heartbeat publication parameters return buffer.

`void bt_mesh_hb_sub_get(struct bt_mesh_hb_sub *get)`

Get the current Heartbeat subscription parameters.

#### Parameters

- `get` – Heartbeat subscription parameters return buffer.

`struct bt_mesh_hb_pub`

*#include <heartbeat.h>* Heartbeat Publication parameters

### Public Members

`uint16_t dst`

Destination address.

`uint16_t count`

Remaining publish count.

`uint8_t ttl`

Time To Live value.

`uint16_t feat`

Bitmap of features that trigger a Heartbeat publication if they change. Legal values are `BT_MESH_FEAT_RELAY`, `BT_MESH_FEAT_PROXY`, `BT_MESH_FEAT_FRIEND` and `BT_MESH_FEAT_LOW_POWER`.

uint16\_t net\_idx

Network index used for publishing.

uint32\_t period

Publication period in seconds.

struct bt\_mesh\_hb\_sub

*#include <heartbeat.h>* Heartbeat Subscription parameters.

### Public Members

uint32\_t period

Subscription period in seconds.

uint32\_t remaining

Remaining subscription time in seconds.

uint16\_t src

Source address to receive Heartbeats from.

uint16\_t dst

Destination address to received Heartbeats on.

uint16\_t count

The number of received Heartbeat messages so far.

uint8\_t min\_hops

Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

uint8\_t max\_hops

Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

struct bt\_mesh\_hb\_cb

*#include <heartbeat.h>* Heartbeat callback structure

### Public Members

void (\*recv)(const struct *bt\_mesh\_hb\_sub* \*sub, uint8\_t hops, uint16\_t feat)

Receive callback for heartbeats.

Gets called on every received Heartbeat that matches the current Heartbeat subscription parameters.

**Param sub** Current Heartbeat subscription parameters.

**Param hops** The number of hops the Heartbeat was received with.

**Param feat** The feature set of the publishing node. The value is a bitmap of [BT\\_MESH\\_FEAT\\_RELAY](#), [BT\\_MESH\\_FEAT\\_PROXY](#), [BT\\_MESH\\_FEAT\\_FRIEND](#) and [BT\\_MESH\\_FEAT\\_LOW\\_POWER](#).

```
void (*sub_end)(const struct bt\_mesh\_hb\_sub *sub)
```

Subscription end callback for heartbeats.

Gets called when the subscription period ends, providing a summary of the received heartbeat messages.

**Param sub** Current Heartbeat subscription parameters.

## Runtime Configuration

The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth mesh nodes should generally be configured by a central network configurator device with a [Configuration Client](#) model. Each mesh node instantiates a [Configuration Server](#) model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can't rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

## API reference

`group bt_mesh_cfg`

Runtime Configuration.

### Defines

`BT_MESH_KR_NORMAL`

`BT_MESH_KR_PHASE_1`

`BT_MESH_KR_PHASE_2`

BT\_MESH\_FRIEND\_ENABLED

BT\_MESH\_FRIEND\_NOT\_SUPPORTED

BT\_MESH\_NODE\_IDENTITY\_STOPPED

BT\_MESH\_NODE\_IDENTITY\_RUNNING

BT\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED

## Enums

enum bt\_mesh\_feat\_state

Bluetooth mesh feature states

*Values:*

enumerator BT\_MESH\_FEATURE\_DISABLED

Feature is supported, but disabled.

enumerator BT\_MESH\_FEATURE\_ENABLED

Feature is supported and enabled.

enumerator BT\_MESH\_FEATURE\_NOT\_SUPPORTED

Feature is not supported, and cannot be enabled.

## Functions

void bt\_mesh\_beacon\_set (bool beacon)

Enable or disable sending of the Secure Network Beacon.

### Parameters

- beacon – New Secure Network Beacon state.

bool bt\_mesh\_beacon\_enabled (void)

Get the current Secure Network Beacon state.

**Returns** Whether the Secure Network Beacon feature is enabled.

int bt\_mesh\_default\_ttl\_set (uint8\_t default\_ttl)

Set the default TTL value.

The default TTL value is used when no explicit TTL value is set. Models will use the default TTL value when `bt_mesh_msg_ctx::send_ttl` is `BT_MESH_TTL_DEFAULT`.

**Parameters**

- `default_ttl` – The new default TTL value. Valid values are 0x00 and 0x02 to [BT\\_MESH\\_TTL\\_MAX](#).

**Return values**

- 0 – Successfully set the default TTL value.
- -EINVAL – Invalid TTL value.

`uint8_t bt_mesh_default_ttl_get(void)`

Get the current default TTL value.

**Returns** The current default TTL value.

`void bt_mesh_net_transmit_set(uint8_t xmit)`

Set the Network Transmit parameters.

The Network Transmit parameters determine the parameters local messages are transmitted with.

**See also:**

[BT\\_MESH\\_TRANSMIT](#)

**Parameters**

- `xmit` – New Network Transmit parameters. Use [BT\\_MESH\\_TRANSMIT](#) for encoding.

`uint8_t bt_mesh_net_transmit_get(void)`

Get the current Network Transmit parameters.

The [BT\\_MESH\\_TRANSMIT\\_COUNT](#) and [BT\\_MESH\\_TRANSMIT\\_INT](#) macros can be used to decode the Network Transmit parameters.

**Returns** The current Network Transmit parameters.

`int bt_mesh_relay_set(enum bt\_mesh\_feat\_state relay, uint8_t xmit)`

Configure the Relay feature.

Enable or disable the Relay feature, and configure the parameters to transmit relayed messages with.

Support for the Relay feature must be enabled through the `CONFIG_BT_MESH_RELAY` configuration option.

**See also:**

[BT\\_MESH\\_TRANSMIT](#)

**Parameters**

- `relay` – New Relay feature state. Must be one of [BT\\_MESH\\_FEATURE\\_ENABLED](#) and [BT\\_MESH\\_FEATURE\\_DISABLED](#).
- `xmit` – New Relay retransmit parameters. Use [BT\\_MESH\\_TRANSMIT](#) for encoding.

**Return values**

- 0 – Successfully changed the Relay configuration.
- -ENOTSUP – The Relay feature is not supported.

- -EINVAL – Invalid parameter.
- -EALREADY – Already using the given parameters.

enum [bt\\_mesh\\_feat\\_state](#) bt\_mesh\_relay\_get(void)

Get the current Relay feature state.

**Returns** The Relay feature state.

uint8\_t bt\_mesh\_relay\_retransmit\_get(void)

Get the current Relay Retransmit parameters.

The [BT\\_MESH\\_TRANSMIT\\_COUNT](#) and [BT\\_MESH\\_TRANSMIT\\_INT](#) macros can be used to decode the Relay Retransmit parameters.

**Returns** The current Relay Retransmit parameters, or 0 if relay is not supported.

int bt\_mesh\_gatt\_proxy\_set(enum [bt\\_mesh\\_feat\\_state](#) gatt\_proxy)

Enable or disable the GATT Proxy feature.

Support for the GATT Proxy feature must be enabled through the CONFIG\_BT\_MESH\_GATT\_PROXY configuration option.

---

**Note:** The GATT Proxy feature only controls a Proxy node's ability to relay messages to the mesh network. A node that supports GATT Proxy will still advertise Connectable Proxy beacons, even if the feature is disabled. The Proxy feature can only be fully disabled through compile time configuration.

---

#### Parameters

- gatt\_proxy – New GATT Proxy state. Must be one of [BT\\_MESH\\_FEATURE\\_ENABLED](#) and [BT\\_MESH\\_FEATURE\\_DISABLED](#).

#### Return values

- 0 – Successfully changed the GATT Proxy feature state.
- -ENOTSUP – The GATT Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum [bt\\_mesh\\_feat\\_state](#) bt\_mesh\_gatt\_proxy\_get(void)

Get the current GATT Proxy state.

**Returns** The GATT Proxy feature state.

int bt\_mesh\_friend\_set(enum [bt\\_mesh\\_feat\\_state](#) friendship)

Enable or disable the Friend feature.

Any active friendships will be terminated immediately if the Friend feature is disabled.

Support for the Friend feature must be enabled through the CONFIG\_BT\_MESH\_FRIEND configuration option.

#### Parameters

- friendship – New Friend feature state. Must be one of [BT\\_MESH\\_FEATURE\\_ENABLED](#) and [BT\\_MESH\\_FEATURE\\_DISABLED](#).

#### Return values

- 0 – Successfully changed the Friend feature state.
- -ENOTSUP – The Friend feature is not supported.

- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum *bt\_mesh\_feat\_state* bt\_mesh\_friend\_get(void)

Get the current Friend state.

**Returns** The Friend feature state.

## Bluetooth Mesh Shell

The Bluetooth mesh shell subsystem provides a set of Bluetooth mesh shell commands for the *Shell* module. It allows for testing and exploring the Bluetooth mesh API through an interactive interface, without having to write an application.

The Bluetooth mesh shell interface provides access to most Bluetooth mesh features, including provisioning, configuration, and message sending.

**Prerequisites** The Bluetooth mesh shell subsystem depends on the *Configuration Client* and *Health Client* models.

**Application** The Bluetooth mesh shell subsystem is most easily used through the Bluetooth mesh shell application under `tests/bluetooth/mesh_shell`. See *Shell* for information on how to connect and interact with the Bluetooth mesh shell application.

**Basic usage** The Bluetooth mesh shell subsystem adds a single mesh command, which holds a set of sub-commands. Every time the device boots up, make sure to call `mesh init` before any of the other Bluetooth mesh shell commands can be called:

```
uart:~$ mesh init
```

**Provisioning** The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To provision the device with the default network key and address 0x0001, execute:

```
uart:~$ mesh provision 0 0x0001
```

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they're assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with `mesh pb-adv on` or `mesh pb-gatt on`. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call `mesh dst <addr>`.
- To set the network key index, call `mesh netidx <NetIdx>`.
- To set the application key index, call `mesh appidx <AppIdx>`.

By default, the transmission parameters are set to send messages to the provisioned address and network key.

**Configuration** By setting the destination address to the local unicast address (0x0001 in the mesh provision command above), we can perform self-configuration through any of the *Configuration Client model* commands.

A good first step is to read out the node's own composition data:

```
uart:~$ mesh get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it's a good idea to add one:

```
uart:~$ mesh app-key-add 0 0
```

**Message sending** With an application key added (see above), the mesh node's transition parameters are all valid, and the Bluetooth mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:

```
uart:~$ mesh net-send 82020100
```

---

**Note:** All multibyte fields model messages are in little endian, except the opcode.

---

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

```
uart:~$ mesh dst 0xffff
```

With the destination address set to 0xffff, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

---

**Note:** To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

---

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in `subsys/bluetooth/mesh/shell.c`, and print the incoming message to the shell in the handler callback.

**Parameter formats** The Bluetooth mesh shell commands are parsed with a variety of formats:

Table 3: Parameter formats

Type	Description	Example
Integers	The default format unless something else is specified. Can be either decimal or hexadecimal.	1234, 0xabcd01234
Hexstrings	For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.	deadbeef01234
Booleans	Boolean values are denoted in the API documentation as <code>&lt;val: on, off&gt;</code> .	on, off, enabled, disabled, 1, 0

**Commands** The Bluetooth mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, `mesh lpn <value: off, on>`. Mandatory parameters are marked with angle brackets (e.g. `<NetKeyIndex>`), and optional parameters are marked with square brackets (e.g. `[destination address]`).

The Bluetooth mesh shell commands are divided into the following groups:

- *General configuration*
- *Testing*
- *Provisioning*
- *Configuration Client model*
- *Health Client model*
- *Health Server model*
- *Configuration database*

---

**Note:** Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling `mesh` without any arguments.

---

## General configuration

`mesh init`

Initialize the mesh. This command must be run before any other mesh command.

`mesh reset <addr>`

reset the local mesh node to its initial unprovisioned state or reset a remote node and remove it from the network. \* `addr`: address of the node to reset.

`mesh lpn <value: off, on>`

Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes. The device will not be able to receive messages from the mesh network until the friendship has been established.

- `value`: Sets whether Low Power operation is enabled.

`mesh poll`

Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

`mesh ident`

Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.

```
mesh dst [destination address]
```

Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell's control.

- `destination address`: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

```
mesh netidx [NetIdx]
```

Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The network key must already be added to the device, either through provisioning or by a Configuration Client.

- `NetIdx`: If present, sets the new network index. If omitted, the current network index is printed.

```
mesh appidx [AppIdx]
```

Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.

- `AppIdx`: If present, sets the new application index. If omitted, the current application index is printed.

```
mesh net-send <hex string>
```

Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.

- `hex string` Raw hexadecimal representation of the message to send.

## Testing

```
mesh iv-update
```

Force an IV update.

```
mesh iv-update-test <value: off, on>
```

Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.

- `value`: Enable or disable the IV update test mode.

```
mesh rpl-clear
```

Clear the replay protection list, forcing the node to forget all received messages.

**Warning:** Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

## Provisioning

```
mesh pb-gatt <val: off, on>
```

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.

- `val`: Enable or disable provisioning with GATT

```
mesh pb-adv <val: off, on>
```

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.

- `val`: Enable or disable provisioning with advertiser

```
mesh provision-adv <UUID> <NetKeyIndex> <addr> <AttentionDuration>
```

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by `NetKeyIndex`.

- `UUID`: UUID of the unprovisioned device.
- `NetKeyIndex`: Index of the network key to pass to the device.
- `addr`: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- `AttentionDuration`: The duration in seconds the unprovisioned device will identify itself for, if supported. See [Attention state](#) for details.

```
mesh uuid <UUID: 1-16 hex values>
```

Set the mesh node's UUID, used in the unprovisioned beacons.

- `UUID`: New 128-bit UUID value. Any missing bytes will be zero.

```
mesh input-num <number>
```

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

- `number`: Decimal authentication number.

```
mesh input-str <string>
```

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

- `string`: Unquoted alphanumeric authentication string.

```
mesh static-oob [val: 1-16 hex values]
```

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning.

- `val`: If present, indicates the new hexadecimal value of the static OOB. If omitted, the static OOB value is cleared.

`mesh provision <NetKeyIndex> <addr> [IVIndex]`

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

- `NetKeyIndex`: Index of the network key to provision.
- `addr`: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.
- `IVindex`: Indicates the current network IV index. Defaults to 0 if omitted.

`mesh beacon-listen <val: off, on>`

Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner device to detect nearby unprovisioned devices and provision them.

- `val`: Whether to enable the unprovisioned beacon printing.

**Configuration Client model** The Bluetooth mesh shell module instantiates a Configuration Client model for configuring itself and other nodes in the mesh network.

The Configuration Client uses the general messages parameters set by `mesh dst` and `mesh netidx` to target specific nodes. When the Bluetooth mesh shell node is provisioned, the Configuration Client model targets itself by default. When another node has been provisioned by the Bluetooth mesh shell, the Configuration Client model targets the new node. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and mesh nodes it provisioned.

`mesh timeout [timeout in seconds]`

Get and set the Config Client model timeout used during message sending.

- `timeout in seconds`: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

`mesh get-comp [page]`

Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.

- `page`: The composition data page to request. Defaults to 0 if omitted.

`mesh beacon [val: off, on]`

Get or set the network beacon transmission.

- `val`: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

`mesh ttl [ttl: 0x00, 0x02-0x7f]`

Get or set the default TTL value.

- `ttl`: If present, sets the new default TTL value. If omitted, the current default TTL value is printed.

```
mesh friend [val: off, on]
```

Get or set the Friend feature.

- `val`: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.

```
mesh gatt-proxy [val: off, on]
```

Get or set the GATT Proxy feature.

- `val`: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.

```
mesh relay [<val: off, on> [<count: 0-7> [interval: 10-320]]]
```

Get or set the Relay feature and its parameters.

- `val`: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.
- `count`: Sets the new relay retransmit count if `val` is on. Ignored if `val` is off. Defaults to 2 if omitted.
- `interval`: Sets the new relay retransmit interval in milliseconds if `val` is on. Ignored if `val` is off. Defaults to 20 if omitted.

```
mesh net-transmit-param [<count: 0-7> <interval: 10-320>]
```

Get or set the network transmit parameters.

- `count`: Sets the number of additional network transmits for every sent message.
- `interval`: Sets the new network retransmit interval in milliseconds.

```
mesh net-key-add <NetKeyIndex> [val]
```

Add a network key to the target node. Adds the key to the Configuration Database if enabled.

- `NetKeyIndex`: The network key index to add.
- `val`: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

```
mesh net-key-get
```

Get a list of known network key indexes.

```
mesh net-key-del <NetKeyIndex>
```

Delete a network key from the target node.

- **NetKeyIndex**: The network key index to delete.

```
mesh app-key-add <NetKeyIndex> <AppKeyIndex> [val]
```

Add an application key to the target node. Adds the key to the Configuration Database if enabled.

- **NetKeyIndex**: The network key index the application key is bound to.
- **AppKeyIndex**: The application key index to add.
- **val**: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

```
mesh app-key-get <NetKeyIndex>
```

Get a list of known application key indexes bound to the given network key index.

- **NetKeyIndex**: Network key indexes to get a list of application key indexes from.

```
mesh app-key-del <NetKeyIndex> <AppKeyIndex>
```

Delete an application key from the target node.

- **NetKeyIndex**: The network key index the application key is bound to.
- **AppKeyIndex**: The application key index to delete.

```
mesh mod-app-bind <addr> <AppIndex> <Model ID> [Company ID]
```

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to bind to the model.
- **Model ID**: The model ID of the model to bind the key to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-app-unbind <addr> <AppIndex> <Model ID> [Company ID]
```

Unbind an application key from a model.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to unbind from the model.
- **Model ID**: The model ID of the model to unbind the key from.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-app-get <elem addr> <Model ID> [Company ID]
```

Get a list of application keys bound to a model.

- `elem addr`: Address of the element the model is on.
- `Model ID`: The model ID of the model to get the bound keys of.
- `Company ID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-pub <addr> <mod id> [cid] [<PubAddr> <AppKeyIndex> <cred: off, on> <ttl>  
<period> <count> <interval>]
```

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- `addr`: Address of the element the model is on.
- `Model ID`: The model ID of the model to get the bound keys of.
- `cid`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- `PubAddr`: The destination address to publish to.
- `AppKeyIndex`: The application key index to publish with.
- `cred`: Whether to publish with Friendship credentials when acting as a Low Power Node.
- `ttl`: TTL value to publish with (0x00 to 0x07f).
- `period`: Encoded publication period, or 0 to disable periodic publication.
- `count`: Number of retransmission for each published message (0 to 7).
- `interval`: The interval between each retransmission, in milliseconds. Must be a multiple of 50.

```
mesh mod-sub-add <elem addr> <sub addr> <Model ID> [Company ID]
```

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- `elem addr`: Address of the element the model is on.
- `sub addr`: 16-bit group address the model should subscribe to (0xc000 to 0xFEFF).
- `Model ID`: The model ID of the model to add the subscription to.
- `Company ID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-sub-del <elem addr> <sub addr> <Model ID> [Company ID]
```

Unsubscribe a model from a group address.

- `elem addr`: Address of the element the model is on.
- `sub addr`: 16-bit group address the model should remove from its subscription list (0xc000 to 0xFEFF).
- `Model ID`: The model ID of the model to add the subscription to.

- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-sub-add-va <elem addr> <Label UUID> <Model ID> [Company ID]
```

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **elem addr**: Address of the element the model is on.
- **Label UUID**: 128-bit label UUID of the virtual address to subscribe to. Any omitted bytes will be zero.
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-sub-del-va <elem addr> <Label UUID> <Model ID> [Company ID]
```

Unsubscribe a model from a virtual address.

- **elem addr**: Address of the element the model is on.
- **Label UUID**: 128-bit label UUID of the virtual address to remove the subscription of. Any omitted bytes will be zero.
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh mod-sub-get <elem addr> <Model ID> [Company ID]
```

Get a list of addresses the model subscribes to.

- **elem addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the subscription list of.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh hb-sub [<src> <dst> <period>]
```

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- **src**: Unicast source address to receive Heartbeat messages from.
- **dst**: Destination address to receive Heartbeat messages on.
- **period**: Logarithmic representation of the Heartbeat subscription period:
  - 0: Heartbeat subscription will be disabled.
  - 1 to 17: The node will subscribe to Heartbeat messages for  $2^{(\text{period} - 1)}$  seconds.

```
mesh hb-pub [<dst> <count> <period> <ttl> <features> <NetKeyIndex>]
```

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- **dst**: Destination address to publish Heartbeat messages to.
- **count**: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will periodically publish  $2^{(\text{count} - 1)}$  Heartbeat messages.
  - 255: Heartbeat messages will be published periodically indefinitely.
- **period**: Logarithmic representation of the Heartbeat publication period:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will publish Heartbeat messages every  $2^{(\text{period} - 1)}$  seconds.
- **ttl**: The TTL value to publish Heartbeat messages with (0x00 to 0x7f).
- **features**: Bitfield of features that should trigger a Heartbeat publication when changed:
  - Bit 0: Relay feature.
  - Bit 1: Proxy feature.
  - Bit 2: Friend feature.
  - Bit 3: Low Power feature.
- **NetKeyIndex**: Index of the network key to publish Heartbeat messages with.

**Health Client model** The Bluetooth mesh shell module instantiates a Health Client model for configuring itself and other nodes in the mesh network.

The Health Client uses the general messages parameters set by `mesh dst` and `mesh netidx` to target specific nodes. When the Bluetooth mesh shell node is provisioned, the Health Client model targets itself by default. When another node has been provisioned by the Bluetooth mesh shell, the Health Client model targets the new node. The Health Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and mesh nodes it provisioned.

```
mesh fault-get <Company ID>
```

Get a list of registered faults for a Company ID.

- **Company ID**: Company ID to get faults for.

```
mesh fault-clear <Company ID>
```

Clear the list of faults for a Company ID.

- **Company ID**: Company ID to clear the faults for.

```
mesh fault-clear-unack <Company ID>
```

Clear the list of faults for a Company ID without requesting a response.

- **Company ID**: Company ID to clear the faults for.

```
mesh fault-test <Company ID> <Test ID>
```

Invoke a self-test procedure, and show a list of triggered faults.

- `Company ID`: Company ID to perform self-tests for.
- `Test ID`: Test to perform.

```
mesh fault-test-unack <Company ID> <Test ID>
```

Invoke a self-test procedure without requesting a response.

- `Company ID`: Company ID to perform self-tests for.
- `Test ID`: Test to perform.

```
mesh period-get
```

Get the current Health Server publish period divisor.

```
mesh period-set <divisor>
```

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor:  $\text{Fault publish period} = \text{Publish period} / 2^{\text{divisor}}$ .

- `divisor`: The new Health Server publish period divisor.

```
mesh period-set-unack <divisor>
```

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor:  $\text{Fault publish period} = \text{Publish period} / 2^{\text{divisor}}$ .

- `divisor`: The new Health Server publish period divisor.

```
mesh attention-get
```

Get the current Health Server attention state.

```
mesh attention-set <timer>
```

Enable the Health Server attention state for some time.

- `timer`: Duration of the attention state, in seconds (0 to 255)

```
mesh attention-set-unack <timer>
```

Enable the Health Server attention state for some time without requesting a response.

- `timer`: Duration of the attention state, in seconds (0 to 255)

## Health Server model

```
mesh add-fault <Fault ID>
```

Register a new Fault for the Linux Foundation Company ID.

- **Fault ID:** ID of the fault to register (0x0001 to 0xFFFF)

```
mesh del-fault [Fault ID]
```

Remove registered faults for the Linux Foundation Company ID.

- **Fault ID:** If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

**Configuration database** The Configuration database is an optional mesh subsystem that can be enabled through the `:kconfig:CONFIG_BT_MESH_CDB` configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

```
mesh cdb-create [NetKey]
```

Create a Configuration database.

- **NetKey:** Optional network key value of the primary network key (NetKeyIndex=0). Defaults to the default key value if omitted.

```
mesh cdb-clear
```

Clear all data from the Configuration database.

```
mesh cdb-show
```

Show all data in the Configuration database.

```
mesh cdb-node-add <UUID> <addr> <num-elem> <NetKeyIdx> [DevKey]
```

Manually add a mesh node to the configuration database. Note that devices provisioned with `mesh provision` and `mesh provision-adv` will be added automatically if the Configuration Database is enabled and created.

- **UUID:** 128-bit hexadecimal UUID of the node. Any omitted bytes will be zero.
- **addr:** Unicast address of the node, or 0 to automatically choose the lowest available address.
- **num-elem:** Number of elements on the node.
- **NetKeyIdx:** The network key the node was provisioned with.
- **DevKey:** Optional 128-bit device key value for the device. If omitted, a random value will be generated.

```
mesh cdb-node-del <addr>
```

Delete a mesh node from the Configuration database. If possible, the node should be reset with `mesh reset` before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- **addr** Address of the node to delete.

```
mesh cdb-subnet-add <NetKeyId> [<NetKey>]
```

Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known network keys.

- NetKeyId: Key index of the network key to add.
- NetKey: Optional 128-bit network key value. Any missing bytes will be zero. If omitted, a random value will be generated.

```
mesh cdb-subnet-del <NetKeyId>
```

Delete a network key from the Configuration database.

- NetKeyId: Key index of the network key to delete.

```
mesh cdb-app-key-add <NetKeyId> <AppKeyId> [<AppKey>]
```

Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known application keys.

- NetKeyId: Network key index the application key is bound to.
- AppKeyId: Key index of the application key to add.
- AppKey: Optional 128-bit application key value. Any missing bytes will be zero. If omitted, a random value will be generated.

```
mesh cdb-app-key-del <AppKeyId>
```

Delete an application key from the Configuration database.

- AppKeyId: Key index of the application key to delete.

## 7.4.12 Serial Port Emulation (RFCOMM)

### API Reference

*group* `bt_rfcomm`  
RFCOMM.

### Typedefs

```
typedef enum bt_rfcomm_role bt_rfcomm_role_t
```

Role of RFCOMM session and dlc. Used only by internal APIs.

### Enums

```
enum [anonymous]
```

*Values:*

enumerator `BT_RFCOMM_CHAN_HFP_HF` = 1

enumerator BT\_RFCOMM\_CHAN\_HFP\_AG

enumerator BT\_RFCOMM\_CHAN\_HSP\_AG

enumerator BT\_RFCOMM\_CHAN\_HSP\_HS

enumerator BT\_RFCOMM\_CHAN\_SPP

enum bt\_rfcomm\_role

Role of RFCOMM session and dlc. Used only by internal APIs.

*Values:*

enumerator BT\_RFCOMM\_ROLE\_ACCEPTOR

enumerator BT\_RFCOMM\_ROLE\_INITIATOR

## Functions

int bt\_rfcomm\_server\_register(struct [bt\\_rfcomm\\_server](#) \*server)

Register RFCOMM server.

Register RFCOMM server for a channel, each new connection is authorized using the accept() callback which in case of success shall allocate the dlc structure to be used by the new connection.

### Parameters

- `server` – Server structure.

**Returns** 0 in case of success or negative value in case of error.

int bt\_rfcomm\_dlc\_connect(struct bt\_conn \*conn, struct [bt\\_rfcomm\\_dlc](#) \*dlc, uint8\_t channel)

Connect RFCOMM channel.

Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

### Parameters

- `conn` – Connection object.
- `dlc` – Dlc object.
- `channel` – Server channel to connect to.

**Returns** 0 in case of success or negative value in case of error.

int bt\_rfcomm\_dlc\_send(struct [bt\\_rfcomm\\_dlc](#) \*dlc, struct [net\\_buf](#) \*buf)

Send data to RFCOMM.

Send data from buffer to the dlc. Length should be less than or equal to mtu.

### Parameters

- `dlc` – Dlc object.
- `buf` – Data buffer.

**Returns** Bytes sent in case of success or negative value in case of error.

```
int bt_rfcomm_dlc_disconnect(struct bt_rfcomm_dlc *dlc)
```

Disconnect RFCOMM dlc.

Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result the dlc disconnected() callback is called.

**Parameters**

- dlc – Dlc object.

**Returns** 0 in case of success or negative value in case of error.

```
struct net_buf *bt_rfcomm_create_pdu(struct net_buf_pool *pool)
```

Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

**Parameters**

- pool – Which pool to take the buffer from.

**Returns** New buffer.

```
struct bt_rfcomm_dlc_ops
```

*#include <rfcomm.h>* RFCOMM DLC operations structure.

**Public Members**

```
void (*connected)(struct bt_rfcomm_dlc *dlc)
```

DLC connected callback

If this callback is provided it will be called whenever the connection completes.

**Param dlc** The dlc that has been connected

```
void (*disconnected)(struct bt_rfcomm_dlc *dlc)
```

DLC disconnected callback

If this callback is provided it will be called whenever the dlc is disconnected, including when a connection gets rejected or cancelled (both incoming and outgoing)

**Param dlc** The dlc that has been Disconnected

```
void (*recv)(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
```

DLC recv callback

**Param dlc** The dlc receiving data.

**Param buf** Buffer containing incoming data.

```
struct bt_rfcomm_dlc
```

*#include <rfcomm.h>* RFCOMM DLC structure.

```
struct bt_rfcomm_server
```

*#include <rfcomm.h>*

**Public Members**

```
uint8_t channel
```

Server Channel

```
int (*accept)(struct bt_conn *conn, struct bt_rfcomm_dlc **dlc)
```

Server accept callback

This callback is called whenever a new incoming connection requires authorization.

**Param conn** The connection that is requesting authorization

**Param dlc** Pointer to received the allocated dlc

**Return** 0 in case of success or negative value in case of error.

BT\_SDP\_ARRAY\_8(...)

Declare an array of 8-bit elements in an attribute.

BT\_SDP\_ARRAY\_16(...)

Declare an array of 16-bit elements in an attribute.

BT\_SDP\_ARRAY\_32(...)

Declare an array of 32-bit elements in an attribute.

BT\_SDP\_TYPE\_SIZE(\_type)

Declare a fixed-size data element header.

**Parameters**

- `_type` – Data element header containing type and size descriptors.

BT\_SDP\_TYPE\_SIZE\_VAR(\_type, \_size)

Declare a variable-size data element header.

**Parameters**

- `_type` – Data element header containing type and size descriptors.
- `_size` – The actual size of the data.

`BT_SDP_DATA_ELEM_LIST(...)`

Declare a list of data elements.

`BT_SDP_NEW_SERVICE`

SDP New Service Record Declaration Macro.

Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

`BT_SDP_LIST(_att_id, _type_size, _data_elem_seq)`

Generic SDP List Attribute Declaration Macro.

Helper macro to declare a list attribute.

**Parameters**

- `_att_id` – List Attribute ID.
- `_data_elem_seq` – Data element sequence for the list.
- `_type_size` – SDP type and size descriptor.

`BT_SDP_SERVICE_ID(_uuid)`

SDP Service ID Attribute Declaration Macro.

Helper macro to declare a service ID attribute.

**Parameters**

- `_uuid` – Service ID 16bit UUID.

`BT_SDP_SERVICE_NAME(_name)`

SDP Name Attribute Declaration Macro.

Helper macro to declare a service name attribute.

**Parameters**

- `_name` – Service name as a string (up to 256 chars).

`BT_SDP_SUPPORTED_FEATURES(_features)`

SDP Supported Features Attribute Declaration Macro.

Helper macro to declare supported features of a profile/protocol.

**Parameters**

- `_features` – Feature mask as 16bit unsigned integer.

`BT_SDP_RECORD(_attrs)`

SDP Service Declaration Macro.

Helper macro to declare a service.

**Parameters**

- `_attrs` – List of attributes for the service record.

## Typedefs

```
typedef uint8_t (*bt_sdp_discover_func_t)(struct bt_conn *conn, struct bt\_sdp\_client\_result *result)
```

Callback type reporting to user that there is a resolved result on remote for given UUID and the result record buffer can be used by user for further inspection.

A function of this type is given by the user to the `bt_sdp_discover_params` object. It'll be called on each valid record discovery completion for given UUID. When UUID resolution gives back no records then NULL is passed to the user. Otherwise user can get valid record(s) and then the internal hint 'next record' is set to false saying the UUID resolution is complete or the hint can be set by caller to true meaning that next record is available for given UUID. The returned function value allows the user to control retrieving follow-up resolved records if any. If the user doesn't want to read more resolved records for given UUID since current record data fulfills its requirements then should return `BT_SDP_DISCOVER_UUID_STOP`. Otherwise returned value means more subcall iterations are allowable.

**Param conn** Connection object identifying connection to queried remote.

**Param result** Object pointing to logical unparsed SDP record collected on base of response driven by given UUID.

**Return** `BT_SDP_DISCOVER_UUID_STOP` in case of no more need to read next record data and continue discovery for given UUID. By returning `BT_SDP_DISCOVER_UUID_CONTINUE` user allows this discovery continuation.

## Enums

enum [anonymous]

Helper enum to be used as return value of `bt_sdp_discover_func_t`. The value informs the caller to perform further pending actions or stop them.

*Values:*

enumerator `BT_SDP_DISCOVER_UUID_STOP = 0`

enumerator `BT_SDP_DISCOVER_UUID_CONTINUE`

enum `bt_sdp_proto`

Protocols to be asked about specific parameters.

*Values:*

enumerator `BT_SDP_PROTO_RFCOMM = 0x0003`

enumerator `BT_SDP_PROTO_L2CAP = 0x0100`

## Functions

int `bt_sdp_register_service(struct bt_sdp_record *service)`

Register a Service Record.

Register a Service Record. Applications can make use of macros such as `BT_SDP_DECLARE_SERVICE`, `BT_SDP_LIST`, `BT_SDP_SERVICE_ID`, `BT_SDP_SERVICE_NAME`, etc. A service declaration must start with `BT_SDP_NEW_SERVICE`.

### Parameters

- `service` – Service record declared using `BT_SDP_DECLARE_SERVICE`.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_sdp_discover(struct bt_conn *conn, const struct bt_sdp_discover_params *params)
```

Allows user to start SDP discovery session.

The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

#### Parameters

- `conn` – Object identifying connection to remote.
- `params` – SDP discovery parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_sdp_discover_cancel(struct bt_conn *conn, const struct bt_sdp_discover_params *params)
```

Release waiting SDP discovery request.

It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

#### Parameters

- `conn` – Object identifying connection to remote.
- `params` – SDP discovery parameters.

**Returns** 0 in case of success or negative value in case of error.

```
int bt_sdp_get_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint16_t *param)
```

Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

#### Parameters

- `buf` – Original buffered raw record data.
- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param` – On success populated by found parameter value.

**Returns** 0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.

```
int bt_sdp_get_addl_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint8_t param_index, uint16_t *param)
```

Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

#### Parameters

- `buf` – Original buffered raw record data.
- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param_index` – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It's value is from 0, 0 means the first matched result, 1 means the second matched result.
- `param` – **[out]** On success populated by found parameter value.

**Returns** 0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

```
int bt_sdp_get_profile_version(const struct net_buf *buf, uint16_t profile, uint16_t *version)
```

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

#### Parameters

- *buf* – Original buffered raw record data.
- *profile* – Profile family identifier the profile belongs.
- *version* – On success populated by found version number.

**Returns** 0 on success, negative value if error occurred during processing.

```
int bt_sdp_get_features(const struct net_buf *buf, uint16_t *features)
```

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

#### Parameters

- *buf* – Buffer holding original raw record data from remote.
- *features* – On success object to be populated with SupportedFeature mask.

**Returns** 0 on success if feature found and valid, negative in case any error

```
struct bt_sdp_data_elem
```

*#include <sdp.h>* SDP Generic Data Element Value.

```
struct bt_sdp_attribute
```

*#include <sdp.h>* SDP Attribute Value.

```
struct bt_sdp_record
```

*#include <sdp.h>* SDP Service Record Value.

```
struct bt_sdp_client_result
```

*#include <sdp.h>* Generic SDP Client Query Result data holder.

```
struct bt_sdp_discover_params
```

*#include <sdp.h>* Main user structure used in SDP discovery of remote.

#### Public Members

```
const struct bt_uuid *uuid
```

UUID (service) to be discovered on remote SDP entity

```
bt_sdp_discover_func_t func
```

Discover callback to be called on resolved SDP record

```
struct net_buf_pool *pool
```

Memory buffer enabled by user for SDP query results

## 7.4.14 Universal Unique Identifiers (UUIDs)

### API Reference

*group* `bt_uuid`  
UUIDs.

#### Defines

`BT_UUID_SIZE_16`  
Size in octets of a 16-bit UUID

`BT_UUID_SIZE_32`  
Size in octets of a 32-bit UUID

`BT_UUID_SIZE_128`  
Size in octets of a 128-bit UUID

`BT_UUID_INIT_16(value)`  
Initialize a 16-bit UUID.

#### Parameters

- `value` – 16-bit UUID value in host endianness.

`BT_UUID_INIT_32(value)`  
Initialize a 32-bit UUID.

#### Parameters

- `value` – 32-bit UUID value in host endianness.

`BT_UUID_INIT_128(value...)`  
Initialize a 128-bit UUID.

#### Parameters

- `value` – 128-bit UUID array values in little-endian format. Can be combined with [\*BT\\_UUID\\_128\\_ENCODE\*](#) to initialize a UUID from the readable form of UUIDs.

`BT_UUID_DECLARE_16(value)`  
Helper to declare a 16-bit UUID inline.

#### Parameters

- `value` – 16-bit UUID value in host endianness.

**Returns** Pointer to a generic UUID.

`BT_UUID_DECLARE_32(value)`  
Helper to declare a 32-bit UUID inline.

#### Parameters

- `value` – 32-bit UUID value in host endianness.

**Returns** Pointer to a generic UUID.

`BT_UUID_DECLARE_128(value...)`

Helper to declare a 128-bit UUID inline.

#### Parameters

- `value` – 128-bit UUID array values in little-endian format. Can be combined with [BT\\_UUID\\_128\\_ENCODE](#) to declare a UUID from the readable form of UUIDs.

**Returns** Pointer to a generic UUID.

`BT_UUID_16(__u)`

Helper macro to access the 16-bit UUID from a generic UUID.

`BT_UUID_32(__u)`

Helper macro to access the 32-bit UUID from a generic UUID.

`BT_UUID_128(__u)`

Helper macro to access the 128-bit UUID from a generic UUID.

`BT_UUID_128_ENCODE(w32, w1, w2, w3, w48)`

Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data. Can be combined with `BT_UUID_DECLARE_128` to declare a 128-bit UUID.

Example of how to declare the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E

```
BT_UUID_DECLARE_128(
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Example of how to encode the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID128_ALL,
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Just replace the hyphen by the comma and add 0x prefixes.

#### Parameters

- `w32` – First part of the UUID (32 bits)
- `w1` – Second part of the UUID (16 bits)
- `w2` – Third part of the UUID (16 bits)
- `w3` – Fourth part of the UUID (16 bits)
- `w48` – Fifth part of the UUID (48 bits)

**Returns** The comma separated values for UUID 128 initializer that may be used directly as an argument for [BT\\_UUID\\_INIT\\_128](#) or [BT\\_UUID\\_DECLARE\\_128](#)

`BT_UUID_16_ENCODE(w16)`

Encode 16-bit UUID into array values in little-endian format.

Helper macro to encode 16-bit UUID values into advertising data.

Example of how to encode the UUID 0x180a into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID16_ALL, BT_UUID_16_ENCODE(0x180a))
```

**Parameters**

- w16 – UUID value (16-bits)

**Returns** The comma separated values for UUID 16 value that may be used directly as an argument for [BT\\_DATA\\_BYTES](#).

BT\_UUID\_32\_ENCODE(w32)

Encode 32-bit UUID into array values in little-endian format.

Helper macro to encode 32-bit UUID values into advertising data.

Example of how to encode the UUID 0x180a01af into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID32_ALL, BT_UUID_32_ENCODE(0x180a01af))
```

**Parameters**

- w32 – UUID value (32-bits)

**Returns** The comma separated values for UUID 32 value that may be used directly as an argument for [BT\\_DATA\\_BYTES](#).

BT\_UUID\_STR\_LEN

Recommended length of user string buffer for Bluetooth UUID.

The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

BT\_UUID\_GAP\_VAL

Generic Access UUID value.

BT\_UUID\_GAP

Generic Access.

BT\_UUID\_GATT\_VAL

Generic attribute UUID value.

BT\_UUID\_GATT

Generic Attribute.

BT\_UUID\_IAS\_VAL

Immediate Alert Service UUID value.

BT\_UUID\_IAS

Immediate Alert Service.

BT\_UUID\_LLS\_VAL

Link Loss Service UUID value.

BT\_UUID\_LLS

Link Loss Service.

BT\_UUID\_TPS\_VAL

Tx Power Service UUID value.

BT\_UUID\_TPS

Tx Power Service.

BT\_UUID\_CTS\_VAL

Current Time Service UUID value.

BT\_UUID\_CTS

Current Time Service.

BT\_UUID-HTS\_VAL

Health Thermometer Service UUID value.

BT\_UUID-HTS

Health Thermometer Service.

BT\_UUID-DIS\_VAL

Device Information Service UUID value.

BT\_UUID-DIS

Device Information Service.

BT\_UUID-HRS\_VAL

Heart Rate Service UUID value.

BT\_UUID-HRS

Heart Rate Service.

BT\_UUID-BAS\_VAL

Battery Service UUID value.

BT\_UUID-BAS

Battery Service.

BT\_UUID-HIDS\_VAL

HID Service UUID value.

BT\_UUID-HIDS

HID Service.

BT\_UUID-RSCS\_VAL

Running Speed and Cadence Service UUID value.

BT\_UUID\_RSCS

Running Speed and Cadence Service.

BT\_UUID\_CSC\_VAL

Cycling Speed and Cadence Service UUID value.

BT\_UUID\_CSC

Cycling Speed and Cadence Service.

BT\_UUID\_ESS\_VAL

Environmental Sensing Service UUID value.

BT\_UUID\_ESS

Environmental Sensing Service.

BT\_UUID\_BMS\_VAL

Bond Management Service UUID value.

BT\_UUID\_BMS

Bond Management Service.

BT\_UUID\_IPSS\_VAL

IP Support Service UUID value.

BT\_UUID\_IPSS

IP Support Service.

BT\_UUID\_HPS\_VAL

HTTP Proxy Service UUID value.

BT\_UUID\_HPS

HTTP Proxy Service.

BT\_UUID\_OTS\_VAL

Object Transfer Service UUID value.

BT\_UUID\_OTS

Object Transfer Service.

BT\_UUID\_MESH\_PROV\_VAL

Mesh Provisioning Service UUID value.

BT\_UUID\_MESH\_PROV

Mesh Provisioning Service.

BT\_UUID\_MESH\_PROXY\_VAL

Mesh Proxy Service UUID value.

BT\_UUID\_MESH\_PROXY

Mesh Proxy Service.

BT\_UUID\_AICS\_VAL

Audio Input Control Service value.

BT\_UUID\_AICS

Audio Input Control Service.

BT\_UUID\_VCS\_VAL

Volume Control Service value.

BT\_UUID\_VCS

Volume Control Service.

BT\_UUID\_VOCS\_VAL

Volume Offset Control Service value.

BT\_UUID\_VOCS

Volume Offset Control Service.

BT\_UUID\_MICS\_VAL

Microphone Input Control Service value.

BT\_UUID\_MICS

Microphone Input Control Service.

BT\_UUID\_GATT\_PRIMARY\_VAL

GATT Primary Service UUID value.

BT\_UUID\_GATT\_PRIMARY

GATT Primary Service.

BT\_UUID\_GATT\_SECONDARY\_VAL

GATT Secondary Service UUID value.

BT\_UUID\_GATT\_SECONDARY

GATT Secondary Service.

BT\_UUID\_GATT\_INCLUDE\_VAL

GATT Include Service UUID value.

BT\_UUID\_GATT\_INCLUDE

GATT Include Service.

BT\_UUID\_GATT\_CHRC\_VAL

GATT Characteristic UUID value.

BT\_UUID\_GATT\_CHRC

GATT Characteristic.

BT\_UUID\_GATT\_CEP\_VAL

GATT Characteristic Extended Properties UUID value.

BT\_UUID\_GATT\_CEP

GATT Characteristic Extended Properties.

BT\_UUID\_GATT\_CUD\_VAL

GATT Characteristic User Description UUID value.

BT\_UUID\_GATT\_CUD

GATT Characteristic User Description.

BT\_UUID\_GATT\_CCC\_VAL

GATT Client Characteristic Configuration UUID value.

BT\_UUID\_GATT\_CCC

GATT Client Characteristic Configuration.

BT\_UUID\_GATT\_SCC\_VAL

GATT Server Characteristic Configuration UUID value.

BT\_UUID\_GATT\_SCC

GATT Server Characteristic Configuration.

BT\_UUID\_GATT\_CPF\_VAL

GATT Characteristic Presentation Format UUID value.

BT\_UUID\_GATT\_CPF

GATT Characteristic Presentation Format.

BT\_UUID\_GATT\_CAF\_VAL

GATT Characteristic Aggregated Format UUID value.

BT\_UUID\_GATT\_CAF

GATT Characteristic Aggregated Format.

BT\_UUID\_VALID\_RANGE\_VAL

Valid Range Descriptor UUID value.

BT\_UUID\_VALID\_RANGE

Valid Range Descriptor.

BT\_UUID\_HIDS\_EXT\_REPORT\_VAL

HID External Report Descriptor UUID value.

BT\_UUID\_HIDS\_EXT\_REPORT

HID External Report Descriptor.

BT\_UUID\_HIDS\_REPORT\_REF\_VAL

HID Report Reference Descriptor UUID value.

BT\_UUID\_HIDS\_REPORT\_REF

HID Report Reference Descriptor.

BT\_UUID\_ES\_CONFIGURATION\_VAL

Environmental Sensing Configuration Descriptor UUID value.

BT\_UUID\_ES\_CONFIGURATION

Environmental Sensing Configuration Descriptor.

BT\_UUID\_ES\_MEASUREMENT\_VAL

Environmental Sensing Measurement Descriptor UUID value.

BT\_UUID\_ES\_MEASUREMENT

Environmental Sensing Measurement Descriptor.

BT\_UUID\_ES\_TRIGGER\_SETTING\_VAL

Environmental Sensing Trigger Setting Descriptor UUID value.

BT\_UUID\_ES\_TRIGGER\_SETTING

Environmental Sensing Trigger Setting Descriptor.

BT\_UUID\_GAP\_DEVICE\_NAME\_VAL

GAP Characteristic Device Name UUID value.

BT\_UUID\_GAP\_DEVICE\_NAME

GAP Characteristic Device Name.

BT\_UUID\_GAP\_APPEARANCE\_VAL

GAP Characteristic Appearance UUID value.

BT\_UUID\_GAP\_APPEARANCE

GAP Characteristic Appearance.

BT\_UUID\_GAP\_PPCP\_VAL

GAP Characteristic Peripheral Preferred Connection Parameters UUID value.

BT\_UUID\_GAP\_PPCP

GAP Characteristic Peripheral Preferred Connection Parameters.

BT\_UUID\_GATT\_SC\_VAL

GATT Characteristic Service Changed UUID value.

BT\_UUID\_GATT\_SC

GATT Characteristic Service Changed.

BT\_UUID\_ALERT\_LEVEL\_VAL

Alert Level UUID value.

BT\_UUID\_ALERT\_LEVEL

Alert Level.

BT\_UUID\_TPS\_TX\_POWER\_LEVEL\_VAL

TPS Characteristic Tx Power Level UUID value.

BT\_UUID\_TPS\_TX\_POWER\_LEVEL

TPS Characteristic Tx Power Level.

BT\_UUID\_BAS\_BATTERY\_LEVEL\_VAL

BAS Characteristic Battery Level UUID value.

BT\_UUID\_BAS\_BATTERY\_LEVEL

BAS Characteristic Battery Level.

BT\_UUID-HTS\_MEASUREMENT\_VAL

HTS Characteristic Measurement Value UUID value.

BT\_UUID-HTS\_MEASUREMENT

HTS Characteristic Measurement Value.

BT\_UUID\_HIDS\_BOOT\_KB\_IN\_REPORT\_VAL

HID Characteristic Boot Keyboard Input Report UUID value.

BT\_UUID\_HIDS\_BOOT\_KB\_IN\_REPORT

HID Characteristic Boot Keyboard Input Report.

BT\_UUID\_DIS\_SYSTEM\_ID\_VAL

DIS Characteristic System ID UUID value.

BT\_UUID\_DIS\_SYSTEM\_ID

DIS Characteristic System ID.

BT\_UUID\_DIS\_MODEL\_NUMBER\_VAL

DIS Characteristic Model Number String UUID value.

BT\_UUID\_DIS\_MODEL\_NUMBER

DIS Characteristic Model Number String.

BT\_UUID\_DIS\_SERIAL\_NUMBER\_VAL

DIS Characteristic Serial Number String UUID value.

BT\_UUID\_DIS\_SERIAL\_NUMBER

DIS Characteristic Serial Number String.

BT\_UUID\_DIS\_FIRMWARE\_REVISION\_VAL

DIS Characteristic Firmware Revision String UUID value.

BT\_UUID\_DIS\_FIRMWARE\_REVISION

DIS Characteristic Firmware Revision String.

BT\_UUID\_DIS\_HARDWARE\_REVISION\_VAL

DIS Characteristic Hardware Revision String UUID value.

BT\_UUID\_DIS\_HARDWARE\_REVISION

DIS Characteristic Hardware Revision String.

BT\_UUID\_DIS\_SOFTWARE\_REVISION\_VAL

DIS Characteristic Software Revision String UUID value.

BT\_UUID\_DIS\_SOFTWARE\_REVISION

DIS Characteristic Software Revision String.

BT\_UUID\_DIS\_MANUFACTURER\_NAME\_VAL

DIS Characteristic Manufacturer Name String UUID Value.

BT\_UUID\_DIS\_MANUFACTURER\_NAME

DIS Characteristic Manufacturer Name String.

BT\_UUID\_DIS\_PNP\_ID\_VAL

DIS Characteristic PnP ID UUID value.

BT\_UUID\_DIS\_PNP\_ID

DIS Characteristic PnP ID.

BT\_UUID\_CTS\_CURRENT\_TIME\_VAL

CTS Characteristic Current Time UUID value.

BT\_UUID\_CTS\_CURRENT\_TIME

CTS Characteristic Current Time.

BT\_UUID\_MAGN\_DECLINATION\_VAL

Magnetic Declination Characteristic UUID value.

BT\_UUID\_MAGN\_DECLINATION

Magnetic Declination Characteristic.

BT\_UUID\_HIDS\_BOOT\_KB\_OUT\_REPORT\_VAL

HID Boot Keyboard Output Report Characteristic UUID value.

BT\_UUID\_HIDS\_BOOT\_KB\_OUT\_REPORT  
HID Boot Keyboard Output Report Characteristic.

BT\_UUID\_HIDS\_BOOT\_MOUSE\_IN\_REPORT\_VAL  
HID Boot Mouse Input Report Characteristic UUID value.

BT\_UUID\_HIDS\_BOOT\_MOUSE\_IN\_REPORT  
HID Boot Mouse Input Report Characteristic.

BT\_UUID\_HRS\_MEASUREMENT\_VAL  
HRS Characteristic Measurement Interval UUID value.

BT\_UUID\_HRS\_MEASUREMENT  
HRS Characteristic Measurement Interval.

BT\_UUID\_HRS\_BODY\_SENSOR  
HRS Characteristic Body Sensor Location.

BT\_UUID\_HRS\_BODY\_SENSOR\_VAL  
HRS Characteristic Body Sensor Location.

BT\_UUID\_HRS\_CONTROL\_POINT  
HRS Characteristic Control Point.

BT\_UUID\_HRS\_CONTROL\_POINT\_VAL  
HRS Characteristic Control Point UUID value.

BT\_UUID\_HIDS\_INFO\_VAL  
HID Information Characteristic UUID value.

BT\_UUID\_HIDS\_INFO  
HID Information Characteristic.

BT\_UUID\_HIDS\_REPORT\_MAP\_VAL  
HID Report Map Characteristic UUID value.

BT\_UUID\_HIDS\_REPORT\_MAP  
HID Report Map Characteristic.

BT\_UUID\_HIDS\_CTRL\_POINT\_VAL  
HID Control Point Characteristic UUID value.

BT\_UUID\_HIDS\_CTRL\_POINT  
HID Control Point Characteristic.

BT\_UUID\_HIDS\_REPORT\_VAL  
HID Report Characteristic UUID value.

BT\_UUID\_HIDS\_REPORT  
HID Report Characteristic.

BT\_UUID\_HIDS\_PROTOCOL\_MODE\_VAL  
HID Protocol Mode Characteristic UUID value.

BT\_UUID\_HIDS\_PROTOCOL\_MODE  
HID Protocol Mode Characteristic.

BT\_UUID\_RSC\_MEASUREMENT\_VAL  
RSC Measurement Characteristic UUID value.

BT\_UUID\_RSC\_MEASUREMENT  
RSC Measurement Characteristic.

BT\_UUID\_RSC\_FEATURE\_VAL  
RSC Feature Characteristic UUID value.

BT\_UUID\_RSC\_FEATURE  
RSC Feature Characteristic.

BT\_UUID\_CSC\_MEASUREMENT\_VAL  
CSC Measurement Characteristic UUID value.

BT\_UUID\_CSC\_MEASUREMENT  
CSC Measurement Characteristic.

BT\_UUID\_CSC\_FEATURE\_VAL  
CSC Feature Characteristic UUID value.

BT\_UUID\_CSC\_FEATURE  
CSC Feature Characteristic.

BT\_UUID\_SENSOR\_LOCATION\_VAL  
Sensor Location Characteristic UUID value.

BT\_UUID\_SENSOR\_LOCATION  
Sensor Location Characteristic.

BT\_UUID\_SC\_CONTROL\_POINT\_VAL  
SC Control Point Characteristic UUID value.

BT\_UUID\_SC\_CONTROL\_POINT  
SC Control Point Characteristic.

BT\_UUID\_ELEVATION\_VAL  
Elevation Characteristic UUID value.

BT\_UUID\_ELEVATION  
Elevation Characteristic.

BT\_UUID\_PRESSURE\_VAL

Pressure Characteristic UUID value.

BT\_UUID\_PRESSURE

Pressure Characteristic.

BT\_UUID\_TEMPERATURE\_VAL

Temperature Characteristic UUID value.

BT\_UUID\_TEMPERATURE

Temperature Characteristic.

BT\_UUID\_HUMIDITY\_VAL

Humidity Characteristic UUID value.

BT\_UUID\_HUMIDITY

Humidity Characteristic.

BT\_UUID\_TRUE\_WIND\_SPEED\_VAL

True Wind Speed Characteristic UUID value.

BT\_UUID\_TRUE\_WIND\_SPEED

True Wind Speed Characteristic.

BT\_UUID\_TRUE\_WIND\_DIR\_VAL

True Wind Direction Characteristic UUID value.

BT\_UUID\_TRUE\_WIND\_DIR

True Wind Direction Characteristic.

BT\_UUID\_APPARENT\_WIND\_SPEED\_VAL

Apparent Wind Speed Characteristic UUID value.

BT\_UUID\_APPARENT\_WIND\_SPEED

Apparent Wind Speed Characteristic.

BT\_UUID\_APPARENT\_WIND\_DIR\_VAL

Apparent Wind Direction Characteristic UUID value.

BT\_UUID\_APPARENT\_WIND\_DIR

Apparent Wind Direction Characteristic.

BT\_UUID\_GUST\_FACTOR\_VAL

Gust Factor Characteristic UUID value.

BT\_UUID\_GUST\_FACTOR

Gust Factor Characteristic.

BT\_UUID\_POLLEN\_CONCENTRATION\_VAL

Pollen Concentration Characteristic UUID value.

BT\_UUID\_POLLEN\_CONCENTRATION

Pollen Concentration Characteristic.

BT\_UUID\_UV\_INDEX\_VAL

UV Index Characteristic UUID value.

BT\_UUID\_UV\_INDEX

UV Index Characteristic.

BT\_UUID\_IRRADIANCE\_VAL

Irradiance Characteristic UUID value.

BT\_UUID\_IRRADIANCE

Irradiance Characteristic.

BT\_UUID\_RAINFALL\_VAL

Rainfall Characteristic UUID value.

BT\_UUID\_RAINFALL

Rainfall Characteristic.

BT\_UUID\_WIND\_CHILL\_VAL

Wind Chill Characteristic UUID value.

BT\_UUID\_WIND\_CHILL

Wind Chill Characteristic.

BT\_UUID\_HEAT\_INDEX\_VAL

Heat Index Characteristic UUID value.

BT\_UUID\_HEAT\_INDEX

Heat Index Characteristic.

BT\_UUID\_DEW\_POINT\_VAL

Dew Point Characteristic UUID value.

BT\_UUID\_DEW\_POINT

Dew Point Characteristic.

BT\_UUID\_DESC\_VALUE\_CHANGED\_VAL

Descriptor Value Changed Characteristic UUID value.

BT\_UUID\_DESC\_VALUE\_CHANGED

Descriptor Value Changed Characteristic.

BT\_UUID\_MAGN\_FLUX\_DENSITY\_2D\_VAL

Magnetic Flux Density - 2D Characteristic UUID value.

BT\_UUID\_MAGN\_FLUX\_DENSITY\_2D

Magnetic Flux Density - 2D Characteristic.

BT\_UUID\_MAGN\_FLUX\_DENSITY\_3D\_VAL

Magnetic Flux Density - 3D Characteristic UUID value.

BT\_UUID\_MAGN\_FLUX\_DENSITY\_3D

Magnetic Flux Density - 3D Characteristic.

BT\_UUID\_BAR\_PRESSURE\_TREND\_VAL

Barometric Pressure Trend Characteristic UUID value.

BT\_UUID\_BAR\_PRESSURE\_TREND

Barometric Pressure Trend Characteristic.

BT\_UUID\_BMS\_CONTROL\_POINT\_VAL

Bond Management Control Point UUID value.

BT\_UUID\_BMS\_CONTROL\_POINT

Bond Management Control Point.

BT\_UUID\_BMS\_FEATURE\_VAL

Bond Management Feature UUID value.

BT\_UUID\_BMS\_FEATURE

Bond Management Feature.

BT\_UUID\_CENTRAL\_ADDR\_RES\_VAL

Central Address Resolution Characteristic UUID value.

BT\_UUID\_CENTRAL\_ADDR\_RES

Central Address Resolution Characteristic.

BT\_UUID\_URI\_VAL

URI UUID value.

BT\_UUID\_URI

URI.

BT\_UUID\_HTTP\_HEADERS\_VAL

HTTP Headers UUID value.

BT\_UUID\_HTTP\_HEADERS

HTTP Headers.

BT\_UUID\_HTTP\_STATUS\_CODE\_VAL  
HTTP Status Code UUID value.

BT\_UUID\_HTTP\_STATUS\_CODE  
HTTP Status Code.

BT\_UUID\_HTTP\_ENTITY\_BODY\_VAL  
HTTP Entity Body UUID value.

BT\_UUID\_HTTP\_ENTITY\_BODY  
HTTP Entity Body.

BT\_UUID\_HTTP\_CONTROL\_POINT\_VAL  
HTTP Control Point UUID value.

BT\_UUID\_HTTP\_CONTROL\_POINT  
HTTP Control Point.

BT\_UUID\_HTTPS\_SECURITY\_VAL  
HTTPS Security UUID value.

BT\_UUID\_HTTPS\_SECURITY  
HTTPS Security.

BT\_UUID\_OTS\_FEATURE\_VAL  
OTS Feature Characteristic UUID value.

BT\_UUID\_OTS\_FEATURE  
OTS Feature Characteristic.

BT\_UUID\_OTS\_NAME\_VAL  
OTS Object Name Characteristic UUID value.

BT\_UUID\_OTS\_NAME  
OTS Object Name Characteristic.

BT\_UUID\_OTS\_TYPE\_VAL  
OTS Object Type Characteristic UUID value.

BT\_UUID\_OTS\_TYPE  
OTS Object Type Characteristic.

BT\_UUID\_OTS\_SIZE\_VAL  
OTS Object Size Characteristic UUID value.

BT\_UUID\_OTS\_SIZE  
OTS Object Size Characteristic.

BT\_UUID\_OTS\_FIRST\_CREATED\_VAL

OTS Object First-Created Characteristic UUID value.

BT\_UUID\_OTS\_FIRST\_CREATED

OTS Object First-Created Characteristic.

BT\_UUID\_OTS\_LAST\_MODIFIED\_VAL

OTS Object Last-Modified Characteristic UUID value.

BT\_UUID\_OTS\_LAST\_MODIFIED

OTS Object Last-Modified Characteristic.

BT\_UUID\_OTS\_ID\_VAL

OTS Object ID Characteristic UUID value.

BT\_UUID\_OTS\_ID

OTS Object ID Characteristic.

BT\_UUID\_OTS\_PROPERTIES\_VAL

OTS Object Properties Characteristic UUID value.

BT\_UUID\_OTS\_PROPERTIES

OTS Object Properties Characteristic.

BT\_UUID\_OTS\_ACTION\_CP\_VAL

OTS Object Action Control Point Characteristic UUID value.

BT\_UUID\_OTS\_ACTION\_CP

OTS Object Action Control Point Characteristic.

BT\_UUID\_OTS\_LIST\_CP\_VAL

OTS Object List Control Point Characteristic UUID value.

BT\_UUID\_OTS\_LIST\_CP

OTS Object List Control Point Characteristic.

BT\_UUID\_OTS\_LIST\_FILTER\_VAL

OTS Object List Filter Characteristic UUID value.

BT\_UUID\_OTS\_LIST\_FILTER

OTS Object List Filter Characteristic.

BT\_UUID\_OTS\_CHANGED\_VAL

OTS Object Changed Characteristic UUID value.

BT\_UUID\_OTS\_CHANGED

OTS Object Changed Characteristic.

BT\_UUID\_OTS\_TYPE\_UNSPECIFIED\_VAL

OTS Unspecified Object Type UUID value.

BT\_UUID\_OTS\_TYPE\_UNSPECIFIED

OTS Unspecified Object Type.

BT\_UUID\_OTS\_DIRECTORY\_LISTING\_VAL

OTS Directory Listing UUID value.

BT\_UUID\_OTS\_DIRECTORY\_LISTING

OTS Directory Listing.

BT\_UUID\_MESH\_PROV\_DATA\_IN\_VAL

Mesh Provisioning Data In UUID value.

BT\_UUID\_MESH\_PROV\_DATA\_IN

Mesh Provisioning Data In.

BT\_UUID\_MESH\_PROV\_DATA\_OUT\_VAL

Mesh Provisioning Data Out UUID value.

BT\_UUID\_MESH\_PROV\_DATA\_OUT

Mesh Provisioning Data Out.

BT\_UUID\_MESH\_PROXY\_DATA\_IN\_VAL

Mesh Proxy Data In UUID value.

BT\_UUID\_MESH\_PROXY\_DATA\_IN

Mesh Proxy Data In.

BT\_UUID\_MESH\_PROXY\_DATA\_OUT\_VAL

Mesh Proxy Data Out UUID value.

BT\_UUID\_MESH\_PROXY\_DATA\_OUT

Mesh Proxy Data Out.

BT\_UUID\_GATT\_CLIENT\_FEATURES\_VAL

Client Supported Features UUID value.

BT\_UUID\_GATT\_CLIENT\_FEATURES

Client Supported Features.

BT\_UUID\_GATT\_DB\_HASH\_VAL

Database Hash UUID value.

BT\_UUID\_GATT\_DB\_HASH

Database Hash.

BT\_UUID\_GATT\_SERVER\_FEATURES\_VAL

Server Supported Features UUID value.

BT\_UUID\_GATT\_SERVER\_FEATURES

Server Supported Features.

BT\_UUID\_AICS\_STATE\_VAL

Audio Input Control Service State value.

BT\_UUID\_AICS\_STATE

Audio Input Control Service State.

BT\_UUID\_AICS\_GAIN\_SETTINGS\_VAL

Audio Input Control Service Gain Settings Properties value.

BT\_UUID\_AICS\_GAIN\_SETTINGS

Audio Input Control Service Gain Settings Properties.

BT\_UUID\_AICS\_INPUT\_TYPE\_VAL

Audio Input Control Service Input Type value.

BT\_UUID\_AICS\_INPUT\_TYPE

Audio Input Control Service Input Type.

BT\_UUID\_AICS\_INPUT\_STATUS\_VAL

Audio Input Control Service Input Status value.

BT\_UUID\_AICS\_INPUT\_STATUS

Audio Input Control Service Input Status.

BT\_UUID\_AICS\_CONTROL\_VAL

Audio Input Control Service Control Point value.

BT\_UUID\_AICS\_CONTROL

Audio Input Control Service Control Point.

BT\_UUID\_AICS\_DESCRIPTION\_VAL

Audio Input Control Service Input Description value.

BT\_UUID\_AICS\_DESCRIPTION

Audio Input Control Service Input Description.

BT\_UUID\_VCS\_STATE\_VAL

Volume Control Setting value.

BT\_UUID\_VCS\_STATE

Volume Control Setting.

BT\_UUID\_VCS\_CONTROL\_VAL  
Volume Control Control point value.

BT\_UUID\_VCS\_CONTROL  
Volume Control Control point.

BT\_UUID\_VCS\_FLAGS\_VAL  
Volume Control Flags value.

BT\_UUID\_VCS\_FLAGS  
Volume Control Flags.

BT\_UUID\_VOCS\_STATE\_VAL  
Volume Offset State value.

BT\_UUID\_VOCS\_STATE  
Volume Offset State.

BT\_UUID\_VOCS\_LOCATION\_VAL  
Audio Location value.

BT\_UUID\_VOCS\_LOCATION  
Audio Location.

BT\_UUID\_VOCS\_CONTROL\_VAL  
Volume Offset Control Point value.

BT\_UUID\_VOCS\_CONTROL  
Volume Offset Control Point.

BT\_UUID\_VOCS\_DESCRIPTION\_VAL  
Volume Offset Audio Output Description value.

BT\_UUID\_VOCS\_DESCRIPTION  
Volume Offset Audio Output Description.

BT\_UUID\_MICS\_MUTE\_VAL  
Microphone Input Control Service Mute value.

BT\_UUID\_MICS\_MUTE  
Microphone Input Control Service Mute.

BT\_UUID\_SDP\_VAL

BT\_UUID\_SDP

BT\_UUID\_UDP\_VAL

BT\_UUID\_UDP

BT\_UUID\_RFCOMM\_VAL

BT\_UUID\_RFCOMM

BT\_UUID\_TCP\_VAL

BT\_UUID\_TCP

BT\_UUID\_TCS\_BIN\_VAL

BT\_UUID\_TCS\_BIN

BT\_UUID\_TCS\_AT\_VAL

BT\_UUID\_TCS\_AT

BT\_UUID\_ATT\_VAL

BT\_UUID\_ATT

BT\_UUID\_OBEX\_VAL

BT\_UUID\_OBEX

BT\_UUID\_FTP

BT\_UUID\_HTTP\_VAL

BT\_UUID\_HTTP

BT\_UUID\_BNEP\_VAL

BT\_UUID\_BNEP

BT\_UUID\_UPNP\_VAL

BT\_UUID\_UPNP

BT\_UUID\_HIDP\_VAL

BT\_UUID\_HIDP

BT\_UUID\_HCRP\_CTRL\_VAL

BT\_UUID\_HCRP\_CTRL

BT\_UUID\_HCRP\_DATA\_VAL

BT\_UUID\_HCRP\_DATA

BT\_UUID\_HCRP\_NOTE\_VAL

BT\_UUID\_HCRP\_NOTE

BT\_UUID\_AVCTP\_VAL

BT\_UUID\_AVCTP

BT\_UUID\_AVDTP\_VAL

BT\_UUID\_AVDTP

BT\_UUID\_CMTP\_VAL

BT\_UUID\_CMTP

BT\_UUID\_UDI\_VAL

BT\_UUID\_UDI

BT\_UUID\_MCAP\_CTRL\_VAL

BT\_UUID\_MCAP\_CTRL

BT\_UUID\_MCAP\_DATA\_VAL

BT\_UUID\_MCAP\_DATA

BT\_UUID\_L2CAP\_VAL

BT\_UUID\_L2CAP

## Enums

enum [anonymous]

Bluetooth UUID types.

*Values:*

enumerator BT\_UUID\_TYPE\_16

UUID type 16-bit.

enumerator BT\_UUID\_TYPE\_32

UUID type 32-bit.

enumerator BT\_UUID\_TYPE\_128

UUID type 128-bit.

## Functions

int bt\_uuid\_cmp(const struct *bt\_uuid* \*u1, const struct *bt\_uuid* \*u2)

Compare Bluetooth UUIDs.

Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128 bits format before comparing.

### Parameters

- u1 – First Bluetooth UUID to compare
- u2 – Second Bluetooth UUID to compare

**Returns** negative value if *u1* < *u2*, 0 if *u1* == *u2*, else positive

bool bt\_uuid\_create(struct *bt\_uuid* \*uuid, const uint8\_t \*data, uint8\_t data\_len)

Create a *bt\_uuid* from a little-endian data buffer.

Create a *bt\_uuid* from a little-endian data buffer. The *data\_len* parameter is used to determine whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is not allowed over the air.

### Parameters

- uuid – Pointer to the *bt\_uuid* variable
- data – pointer to UUID stored in little-endian data buffer
- data\_len – length of the UUID in the data buffer

**Returns** true if the data was valid and the UUID was successfully created.

void bt\_uuid\_to\_str(const struct *bt\_uuid* \*uuid, char \*str, size\_t len)

Convert Bluetooth UUID to string.

Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

### Parameters

- uuid – Bluetooth UUID
- str – pointer where to put converted string
- len – length of str

**Returns** N/A

struct bt\_uuid

*#include <uuid.h>* This is a ‘tentative’ type and should be used as a pointer only.

struct bt\_uuid\_16

*#include <uuid.h>*

### Public Members

struct *bt\_uuid* uuid

UUID generic type.

uint16\_t val

UUID value, 16-bit in host endianness.

struct bt\_uuid\_32

*#include <uuid.h>*

### Public Members

struct *bt\_uuid* uuid

UUID generic type.

uint32\_t val

UUID value, 32-bit in host endianness.

struct bt\_uuid\_128

*#include <uuid.h>*

### Public Members

struct *bt\_uuid* uuid

UUID generic type.

uint8\_t val[16]

UUID value, 128-bit in little-endian format.

## 7.5 Crypto

### 7.5.1 Overview

### 7.5.2 API Reference

group crypto\_cipher

Crypto Cipher APIs.

## Defines

CAP\_OPAQUE\_KEY\_HNDL

CAP\_RAW\_KEY

CAP\_KEY\_LOADING\_API

CAP\_INPLACE\_OPS

Whether the output is placed in separate buffer or not

CAP\_SEPARATE\_IO\_BUFS

CAP\_SYNC\_OPS

These denotes if the output (completion of a cipher\_XXX\_op) is conveyed by the op function returning, or it is conveyed by an async notification

CAP\_ASYNC\_OPS

CAP\_AUTONONCE

Whether the hardware/driver supports autononce feature

CAP\_NO\_IV\_PREFIX

Don't prefix IV to cipher blocks

## Typedefs

```
typedef int (*block_op_t)(struct cipher_ctx *ctx, struct cipher_pkt *pkt)
```

```
typedef int (*cbc_op_t)(struct cipher_ctx *ctx, struct cipher_pkt *pkt, uint8_t *iv)
```

```
typedef int (*ctr_op_t)(struct cipher_ctx *ctx, struct cipher_pkt *pkt, uint8_t *ctr)
```

```
typedef int (*ccm_op_t)(struct cipher_ctx *ctx, struct cipher_aead_pkt *pkt, uint8_t *nonce)
```

```
typedef int (*gcm_op_t)(struct cipher_ctx *ctx, struct cipher_aead_pkt *pkt, uint8_t *nonce)
```

```
typedef void (*crypto_completion_cb)(struct cipher_pkt *completed, int status)
```

## Enums

```
enum cipher_algo
```

Cipher Algorithm

Values:

enumerator CRYPTO\_CIPHER\_ALGO\_AES = 1

enum cipher\_op

Cipher Operation

*Values:*

enumerator CRYPTO\_CIPHER\_OP\_DECRYPT = 0

enumerator CRYPTO\_CIPHER\_OP\_ENCRYPT = 1

enum cipher\_mode

Possible cipher mode options.

More to be added as required.

*Values:*

enumerator CRYPTO\_CIPHER\_MODE\_ECB = 1

enumerator CRYPTO\_CIPHER\_MODE\_CBC = 2

enumerator CRYPTO\_CIPHER\_MODE\_CTR = 3

enumerator CRYPTO\_CIPHER\_MODE\_CCM = 4

enumerator CRYPTO\_CIPHER\_MODE\_GCM = 5

## Functions

static inline int cipher\_query\_hwcaps(const struct *device* \*dev)

Query the crypto hardware capabilities.

This API is used by the app to query the capabilities supported by the crypto device. Based on this the app can specify a subset of the supported options to be honored for a session during *cipher\_begin\_session()*.

### Parameters

- dev – Pointer to the device structure for the driver instance.

**Returns** bitmask of supported options.

static inline int cipher\_begin\_session(const struct *device* \*dev, struct *cipher\_ctx* \*ctx, enum *cipher\_algo* algo, enum *cipher\_mode* mode, enum *cipher\_op* otype)

Setup a crypto session.

Initializes one time parameters, like the session key, algorithm and cipher mode which may remain constant for all operations in the session. The state may be cached in hardware and/or driver data state variables.

### Parameters

- dev – Pointer to the device structure for the driver instance.

- `ctx` – Pointer to the context structure. Various one time parameters like key, keylength, etc. are supplied via this structure. The structure documentation specifies which fields are to be populated by the app before making this call.
- `algo` – The crypto algorithm to be used in this session. e.g AES
- `mode` – The cipher mode to be used in this session. e.g CBC, CTR
- `optype` – Whether we should encrypt or decrypt in this session

**Returns** 0 on success, negative errno code on fail.

```
static inline int cipher_free_session(const struct device *dev, struct cipher_ctx *ctx)
```

Cleanup a crypto session.

Clears the hardware and/or driver state of a previous session.

#### Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ctx` – Pointer to the crypto context structure of the session to be freed.

**Returns** 0 on success, negative errno code on fail.

```
static inline int cipher_callback_set(const struct device *dev, crypto_completion_cb cb)
```

Registers an async crypto op completion callback with the driver.

The application can register an async crypto op completion callback handler to be invoked by the driver, on completion of a prior request submitted via `crypto_do_op()`. Based on crypto device hardware semantics, this is likely to be invoked from an ISR context.

#### Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cb` – Pointer to application callback to be called by the driver.

**Returns** 0 on success, -ENOTSUP if the driver does not support async op, negative errno code on other error.

```
static inline int cipher_block_op(struct cipher_ctx *ctx, struct cipher_pkt *pkt)
```

Perform single-block crypto operation (ECB cipher mode). This should not be overloaded to operate on multiple blocks for security reasons.

#### Parameters

- `ctx` – Pointer to the crypto context of this op.
- `pkt` – Structure holding the input/output buffer pointers.

**Returns** 0 on success, negative errno code on fail.

```
static inline int cipher_cbc_op(struct cipher_ctx *ctx, struct cipher_pkt *pkt, uint8_t *iv)
```

Perform Cipher Block Chaining (CBC) crypto operation.

#### Parameters

- `ctx` – Pointer to the crypto context of this op.
- `pkt` – Structure holding the input/output buffer pointers.
- `iv` – Initialization Vector (IV) for the operation. Same IV value should not be reused across multiple operations (within a session context) for security.

**Returns** 0 on success, negative errno code on fail.

```
static inline int cipher_ctr_op(struct cipher_ctx *ctx, struct cipher_pkt *pkt, uint8_t *iv)
```

Perform Counter (CTR) mode crypto operation.

#### Parameters

- `ctx` – Pointer to the crypto context of this op.
- `pkt` – Structure holding the input/output buffer pointers.
- `iv` – Initialization Vector (IV) for the operation. We use a split counter formed by appending IV and ctr. Consequently `ivlen = keylen - ctrlen`. ‘`ctrlen`’ is specified during session setup through the ‘`ctx.mode_params.ctr_params.ctr_len`’ parameter. IV should not be reused across multiple operations (within a session context) for security. The non-IV part of the split counter is transparent to the caller and is fully managed by the crypto provider.

**Returns** 0 on success, negative `errno` code on fail.

```
static inline int cipher_ccm_op(struct cipher_ctx *ctx, struct cipher_aead_pkt *pkt, uint8_t
                               *nonce)
```

Perform Counter with CBC-MAC (CCM) mode crypto operation.

#### Parameters

- `ctx` – Pointer to the crypto context of this op.
- `pkt` – Structure holding the input/output, Associated Data (AD) and auth tag buffer pointers.
- `nonce` – Nonce for the operation. Same nonce value should not be reused across multiple operations (within a session context) for security.

**Returns** 0 on success, negative `errno` code on fail.

```
static inline int cipher_gcm_op(struct cipher_ctx *ctx, struct cipher_aead_pkt *pkt, uint8_t
                               *nonce)
```

Perform Galois/Counter Mode (GCM) crypto operation.

#### Parameters

- `ctx` – Pointer to the crypto context of this op.
- `pkt` – Structure holding the input/output, Associated Data (AD) and auth tag buffer pointers.
- `nonce` – Nonce for the operation. Same nonce value should not be reused across multiple operations (within a session context) for security.

**Returns** 0 on success, negative `errno` code on fail.

```
struct crypto_driver_api
    #include <cipher.h>

struct cipher_ops
    #include <cipher_structs.h>

struct ccm_params
    #include <cipher_structs.h>

struct ctr_params
    #include <cipher_structs.h>

struct gcm_params
    #include <cipher_structs.h>
```

struct cipher\_ctx

*#include <cipher\_structs.h>* Structure encoding session parameters.

Refer to comments for individual fields to know the contract in terms of who fills what and when w.r.t begin\_session() call.

### Public Members

struct *cipher\_ops* ops

Place for driver to return function pointers to be invoked per cipher operation. To be populated by crypto driver on return from begin\_session() based on the algo/mode chosen by the app.

union *cipher\_ctx*.[anonymous] key

To be populated by the app before calling begin\_session()

const struct *device* \*device

The device driver instance this crypto context relates to. Will be populated by the begin\_session() API.

void \*drv\_sessn\_state

If the driver supports multiple simultaneously crypto sessions, this will identify the specific driver state this crypto session relates to. Since dynamic memory allocation is not possible, it is suggested that at build time drivers allocate space for the max simultaneous sessions they intend to support. To be populated by the driver on return from begin\_session().

void \*app\_sessn\_state

Place for the user app to put info relevant stuff for resuming when completion callback happens for async ops. Totally managed by the app.

union *cipher\_ctx*.[anonymous] mode\_params

Cypher mode parameters, which remain constant for all ops in a session. To be populated by the app before calling begin\_session().

uint16\_t keylen

Cryptographic keylength in bytes. To be populated by the app before calling begin\_session()

uint16\_t flags

How certain fields are to be interpreted for this session. (A bitmask of CAP\_\* below.) To be populated by the app before calling begin\_session(). An app can obtain the capability flags supported by a hw/driver by calling *cipher\_query\_hwcaps()*.

struct cipher\_pkt

*#include <cipher\_structs.h>* Structure encoding IO parameters of one cryptographic operation like encrypt/decrypt.

The fields which has not been explicitly called out has to be filled up by the app before making the cipher\_xxx\_op() call.

### Public Members

`uint8_t *in_buf`

Start address of input buffer

`int in_len`

Bytes to be operated upon

`uint8_t *out_buf`

Start of the output buffer, to be allocated by the application. Can be NULL for in-place ops. To be populated with contents by the driver on return from op / async callback.

`int out_buf_max`

Size of the out\_buf area allocated by the application. Drivers should not write past the size of output buffer.

`int out_len`

To be populated by driver on return from cipher\_xxx\_op() and holds the size of the actual result.

`struct cipher_ctx *ctx`

Context this packet relates to. This can be useful to get the session details, especially for async ops. Will be populated by the cipher\_xxx\_op() API based on the ctx parameter.

`struct cipher_aead_pkt`

*#include <cipher\_structs.h>* Structure encoding IO parameters in AEAD (Authenticated Encryption with Associated Data) scenario like in CCM.

App has to furnish valid contents prior to making *cipher\_ccm\_op()* call.

### Public Members

`uint8_t *ad`

Start address for Associated Data. This has to be supplied by app.

`uint32_t ad_len`

Size of Associated Data. This has to be supplied by the app.

`uint8_t *tag`

Start address for the auth hash. For an encryption op this will be populated by the driver when it returns from cipher\_ccm\_op call. For a decryption op this has to be supplied by the app.

## 7.6 Devicetree

This is reference documentation for devicetree as it is used for Zephyr development. For a high-level guide, see [Devicetree Guide](#). For a platform-independent specification, see the [Devicetree specification](#).

## 7.6.1 Devicetree API

This is a reference page for the `<devicetree.h>` API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these require a special macro named `DT_DRV_COMPAT` to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within *device drivers*, though they can be used outside of drivers with appropriate care.

### Generic APIs

The APIs in this section can be used anywhere and do not require `DT_DRV_COMPAT` to be defined.

**Node identifiers and helpers** A *node identifier* is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the *Property access* API.

The root node `/` has node identifier `DT_ROOT`. You can create node identifiers for other devicetree nodes using `DT_PATH()`, `DT_NODELABEL()`, `DT_ALIAS()`, and `DT_INST()`.

There are also `DT_PARENT()` and `DT_CHILD()` macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

group devicetree-generic-id

### Defines

`DT_INVALID_NODE`

Name for an invalid node identifier.

This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

`DT_ROOT`

Node identifier for the root node in the devicetree.

`DT_PATH(...)`

Get a node identifier for a devicetree path.

(This macro returns a node identifier from path components. To get a path string from a node identifier, use `DT_NODE_PATH()` instead.)

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```
/ {
    soc {
        serial1: serial@40001000 {
            status = "okay";
            current-speed = <115200>;
            ...
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

        };
    };
};

```

You can use `DT_PATH(soc, serial_40001000)` to get a node identifier for the `serial@40001000` node. Node labels like “serial1” cannot be used as `DT_PATH()` arguments; use `DT_NODELABEL()` for those instead.

Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The current-speed property is also in “lowercase-and-underscores” form when used with this API.)

When determining arguments to `DT_PATH()`:

- the first argument corresponds to a child node of the root (“soc” above)
- a second argument corresponds to a child of the first argument (“serial\_40001000” above, from the node name “serial@40001000” after lowercasing and changing “@” to “\_”)
- and so on for deeper nodes in the desired node’s path

#### Parameters

- ... – lowercase-and-underscores node names along the node’s path, with each name given as a separate argument

**Returns** node identifier for the node with that path

`DT_NODELABEL(label)`

Get a node identifier for a node label.

Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

```

serial1: serial@40001000 {
    label = "UART_0";
    status = "okay";
    current-speed = <115200>;
    ...
};

```

The only node label in this example is “serial1”.

The string “UART\_0” is *not* a node label; it’s the value of a property named label.

You can use `DT_NODELABEL(serial1)` to get a node identifier for the `serial@40001000` node. Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
```

Another example devicetree fragment:

```

cpu@0 {
    L2_0: l2-cache {
        cache-level = <2>;
        ...
    }
};

```

(continues on next page)

(continued from previous page)

```
};
};
```

Example usage to get the cache-level property:

```
DT_PROP(DT_NODELABEL(l2_0), cache_level) // 2
```

Notice how “l2\_0” in the devicetree is lowercased to “l2\_0” in the [DT\\_NODELABEL\(\)](#) argument.

#### Parameters

- `label` – lowercase-and-underscores node label name

**Returns** node identifier for the node with that label

`DT_ALIAS(alias)`

Get a node identifier from /aliases.

This macro’s argument is a property of the /aliases node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:

```
/ {
    aliases {
        my-serial = &serial1;
    };

    soc {
        serial1: serial@40001000 {
            status = "okay";
            current-speed = <115200>;
            ...
        };
    };
};
```

You can use [DT\\_ALIAS\(my\\_serial\)](#) to get a node identifier for the serial@40001000 node. Notice how my-serial in the devicetree becomes my\_serial in the [DT\\_ALIAS\(\)](#) argument. Example usage with [DT\\_PROP\(\)](#) to get the current-speed property:

```
DT_PROP(DT_ALIAS(my_serial), current_speed) // 115200
```

#### Parameters

- `alias` – lowercase-and-underscores alias name.

**Returns** node identifier for the node with that alias

`DT_INST(inst, compat)`

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these nodes by passing [DT\\_INST\(\)](#) an instance number, “inst”, along with the lowercase-and-underscores version of the compatible, “compat”.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, **including disabled nodes**
- enabled nodes (status property is “okay” or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the /aliases node (use [DT\\_NODELABEL\(\)](#) or [DT\\_ALIAS\(\)](#) for those)
- there **is no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory

Example devicetree fragment:

```
serial1: serial@40001000 {
    compatible = "vnd,soc-serial";
    status = "disabled";
    current-speed = <9600>;
    ...
};

serial2: serial@40002000 {
    compatible = "vnd,soc-serial";
    status = "okay";
    current-speed = <57600>;
    ...
};

serial3: serial@40003000 {
    compatible = "vnd,soc-serial";
    current-speed = <115200>;
    ...
};
```

Assuming no other nodes in the devicetree have compatible “vnd,soc-serial”, that compatible has nodes with instance numbers 0, 1, and 2.

The nodes serial@40002000 and serial@40003000 are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since serial@40001000 is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)

// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
```

(continues on next page)

(continued from previous page)

```
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)

// 9600, because there is only one disabled node, and
// disabled nodes are "at the the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)
```

Notice how “vnd,soc-serial” in the devicetree becomes `vnd_soc_serial` (without quotes) in the `DT_INST()` arguments. (As usual, current-speed in the devicetree becomes `current_speed` as well.)

Nodes whose “compatible” property has multiple values are assigned independent instance numbers for each compatible.

#### Parameters

- `inst` – instance number for compatible “compat”
- `compat` – lowercase-and-underscores compatible, without quotes

**Returns** node identifier for the node with that instance number and compatible

`DT_PARENT(node_id)`

Get a node identifier for a parent node.

Example devicetree fragment:

```
parent: parent-node {
    child: child-node {
        ...
    };
};
```

The following are equivalent ways to get the same node identifier:

```
DT_NODELABEL(parent)
DT_PARENT(DT_NODELABEL(child))
```

#### Parameters

- `node_id` – node identifier

**Returns** a node identifier for the node’s parent

`DT_GPARENT(node_id)`

Get a node identifier for a grandparent node.

Example devicetree fragment:

```
gparent: grandparent-node {
    parent: parent-node {
        child: child-node { ... }
    };
};
```

The following are equivalent ways to get the same node identifier:

```
DT_GPARENT(DT_NODELABEL(child))
DT_PARENT(DT_PARENT(DT_NODELABEL(child)))
```

#### Parameters

- `node_id` – node identifier

**Returns** a node identifier for the node’s parent’s parent

`DT_CHILD(node_id, child)`

Get a node identifier for a child node.

Example devicetree fragment:

```
/ {
    soc-label: soc {
        serial1: serial@40001000 {
            status = "okay";
            current-speed = <115200>;
            ...
        };
    };
};
```

Example usage with `DT_PROP` to get the status of the `serial@40001000` node:

```
#define SOC_NODE DT_NODELABEL(soc_label)
DT_PROP(DT_CHILD(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like “serial1” cannot be used as the “child” argument to this macro. Use `DT_NODELABEL()` for that instead.

You can also use `DT_FOREACH_CHILD()` to iterate over node identifiers for all of a node’s children.

#### Parameters

- `node_id` – node identifier
- `child` – lowercase-and-underscores child node name

**Returns** node identifier for the node with the name referred to by ‘child’

`DT_COMPAT_GET_ANY_STATUS_OKAY(compat)`

Get a node identifier for a status “okay” node with a compatible.

Use this if you want to get an arbitrary enabled node with a given compatible, and you do not care which one you get. If any enabled nodes with the given compatible exist, a node identifier for one of them is returned. Otherwise, `DT_INVALID_NODE` is returned.

Example devicetree fragment:

```
node-a {
    compatible = "vnd,device";
    status = "okay";
};

node-b {
    compatible = "vnd,device";
    status = "okay";
};

node-c {
    compatible = "vnd,device";
    status = "disabled";
};
```

Example usage:

```
DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)
```

This expands to a node identifier for either node-a or node-b. It will not expand to a node identifier for node-c, because that node does not have status “okay”.

**Parameters**

- `compat` – lowercase-and-underscores compatible, without quotes

**Returns** node identifier for a node with that compatible, or `DT_INVALID_NODE`

`DT_NODE_PATH(node_id)`

Get a devicetree node’s full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from path components instead, use [DT\\_PATH\(\)](#).

Example devicetree fragment:

```
/ {
    soc {
        node: my-node@12345678 { ... };
    };
};
```

Example usage:

```
DT\_NODE\_PATH\(DT\_NODELABEL\(node\)\) // “/soc/my-node@12345678”
DT\_NODE\_PATH\(DT\_PATH\(soc\)\) // “/soc” DT\_NODE\_PATH\(DT\_ROOT\) // “/”
```

**Parameters**

- `node_id` – node identifier

**Returns** the node’s full path in the devicetree

`DT_NODE_FULL_NAME(node_id)`

Get a devicetree node’s name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:

```
/ {
    soc {
        node: my-node@12345678 { ... };
    };
};
```

Example usage:

```
DT\_NODE\_FULL\_NAME\(DT\_NODELABEL\(node\)\) // “my-node@12345678”
```

**Parameters**

- `node_id` – node identifier

**Returns** the node’s name with unit-address as a string in the devicetree

`DT_SAME_NODE(node_id1, node_id2)`

Do `node_id1` and `node_id2` refer to the same node?

Both “`node_id1`” and “`node_id2`” must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with [DT\\_NODE\\_EXISTS\(\)](#)).

The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

**Parameters**

- `node_id1` – first node identifier
- `node_id2` – second node identifier

**Returns** an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

**Property access** The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the [reg property](#) and [interrupts property](#).

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.

group devicetree-generic-prop

## Defines

`DT_PROP(node_id, prop)`

Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- string: a string literal
- boolean: 0 if the property is false, or 1 if it is true
- int: the property's value as an integer literal
- array, uint8-array, string-array: an initializer expression in braces, whose elements are integer or string literals (like {0, 1, 2}, {"hello", "world"}, etc.)
- phandle: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: "compatible" has type string-array, "status" and "label" have type string, and "interrupt-controller" has type boolean.

For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see [DT\\_PATH\(\)](#), [DT\\_ALIAS\(\)](#), [DT\\_NODELABEL\(\)](#), and [DT\\_INST\(\)](#) above.

### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns** a representation of the property's value

`DT_PROP_LEN(node_id, prop)`

Get a property's logical length.

Here, "length" is a number of elements, which may differ from the property's size in bytes.

The return value depends on the property's type:

- for types array, string-array, and uint8-array, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles

- for type phandle-array, this expands to the number of phandle and specifier blocks in the property

These properties are handled as special cases:

- reg property: use `DT_NUM_REGS(node_id)` instead
- interrupts property: use `DT_NUM_IRQS(node_id)` instead

It is an error to use this macro with the reg or interrupts properties.

For other properties, behavior is undefined.

#### Parameters

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length

**Returns** the property's length

`DT_PROP_LEN_OR(node_id, prop, default_value)`

Like `DT_PROP_LEN()`, but with a fallback to `default_value`.

If the property is defined (as determined by `DT_NODE_HAS_PROP()`), this expands to `DT_PROP_LEN(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

#### Parameters

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length
- `default_value` – a fallback value to expand to

**Returns** the property's length or the given default value

`DT_PROP_HAS_IDX(node_id, prop, idx)`

Is index “idx” valid for an array type property?

If this returns 1, then `DT_PROP_BY_IDX(node_id, prop, idx)` or `DT_PHA_BY_IDX(node_id, prop, idx, ...)` are valid at index “idx”. If it returns 0, it is an error to use those macros with that index.

These properties are handled as special cases:

- reg property: use `DT_REG_HAS_IDX(node_id, idx)` instead
- interrupts property: use `DT_IRQ_HAS_IDX(node_id, idx)` instead

It is an error to use this macro with the reg or interrupts properties.

#### Parameters

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length
- `idx` – index to check

**Returns** An expression which evaluates to 1 if “idx” is a valid index into the given property, and 0 otherwise.

`DT_PROP_BY_IDX(node_id, prop, idx)`

Get the value at index “idx” in an array type property.

It might help to read the argument order as being similar to “node->property[index]”.

When the property’s binding has type array, string-array, uint8-array, or phandles, this expands to the idx-th array element as an integer, string literal, or node identifier respectively.

These properties are handled as special cases:

- reg property: use `DT_REG_ADDR_BY_IDX()` or `DT_REG_SIZE_BY_IDX()` instead
- interrupts property: use `DT_IRQ_BY_IDX()` instead

For non-array properties, behavior is undefined.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns** a representation of the idx-th element of the property

`DT_PROP_OR(node_id, prop, default_value)`

Like `DT_PROP()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PROP(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns** the property’s value or `default_value`

`DT_LABEL(node_id)`

Equivalent to `DT_PROP(node_id, label)`

This is a convenience for the Zephyr device API, which uses label properties as `device_get_binding()` arguments.

#### Parameters

- `node_id` – node identifier

**Returns** node’s label property value

`DT_ENUM_IDX(node_id, prop)`

Get a property value’s index into its enumeration values.

The return values start at zero.

Example devicetree fragment:

```
usb1: usb@12340000 {
    maximum-speed = "full-speed";
};
usb2: usb@12341000 {
    maximum-speed = "super-speed";
};
```

Example bindings fragment:

```
properties:
  maximum-speed:
    type: string
    enum:
      - "low-speed"
      - "full-speed"
      - "high-speed"
      - "super-speed"
```

Example usage:

```
DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed) // 1
DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed) // 3
```

### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns** zero-based index of the property's value in its enum: list

`DT_ENUM_IDX_OR(node_id, prop, default_idx_value)`

Like [DT\\_ENUM\\_IDX\(\)](#), but with a fallback to a default enum index.

If the value exists, this expands to its zero based index value thanks to [DT\\_ENUM\\_IDX\(node\\_id, prop\)](#).

Otherwise, this expands to provided default index enum value.

### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_idx_value` – a fallback index value to expand to

**Returns** zero-based index of the property's value in its enum if present, `default_idx_value` otherwise

`DT_STRING_TOKEN(node_id, prop)`

Get a string property's value as a token.

This removes “the quotes” from string-valued properties, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

[DT\\_STRING\\_TOKEN\(\)](#) can only be used for properties with string type.

It is an error to use [DT\\_STRING\\_TOKEN\(\)](#) in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "FOO";
}
n3: node-3 {
    prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_STRING_TOKEN(DT_NODELABEL(n2), prop) // F00
DT_STRING_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The uppcased "FOO" in the DTS remains F00 as a token. It is *not* converted to foo.
- The whitespace in the DTS "123 foo" string is converted to 123\_foo as a token.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property string name

**Returns** the value of `prop` as a token, i.e. without any quotes and with special characters converted to underscores

`DT_STRING_UPPER_TOKEN(node_id, prop)`

Like [DT\\_STRING\\_TOKEN\(\)](#), but uppcased.

This removes “the quotes and capitalize” from string-valued properties, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

[DT\\_STRING\\_UPPER\\_TOKEN\(\)](#) can only be used for properties with string type.

It is an error to use [DT\\_STRING\\_UPPER\\_TOKEN\(\)](#) in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n1), prop) // F00
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n2), prop) // 123_F00
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes F00 as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123\_F00 as a token, i.e. it is uppercased and whitespace becomes an underscore.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property string name

**Returns** the value of `prop` as a token, i.e. without any quotes and with special characters converted to underscores

`DT_ENUM_TOKEN(node_id, prop)`

Get an enumeration property's value as a token.

This allows you to "remove the quotes" from some string-valued properties. That can be useful, for example, when pasting the values onto some other token to form an enum in C using the `##` preprocessor operator.

[`DT\_ENUM\_TOKEN\(\)`](#) can only be used for properties with string type whose binding has an "enum:". The values in the binding's "enum:" list must be unique after converting non-alphanumeric characters to underscores.

It is an error to use [`DT\_ENUM\_TOKEN\(\)`](#) in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "F00";
}
n3: node-3 {
    prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
    enum:
      - "foo"
      - "F00"
      - "123 foo"
```

Example usage:

```
DT_ENUM_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_ENUM_TOKEN(DT_NODELABEL(n2), prop) // F00
DT_ENUM_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The uppercased "FOO" in the DTS remains F00 as a token. It is not\* converted to foo.
- The whitespace in the DTS "123 foo" string is converted to 123\_foo as a token.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name with suitable enumeration of values in its binding

**Returns** the value of `prop` as a token, i.e. without any quotes and with special characters converted to underscores

`DT_ENUM_UPPER_TOKEN(node_id, prop)`

Like [DT\\_ENUM\\_TOKEN\(\)](#), but uppercased.

This allows you to "remove the quotes and capitalize" some string-valued properties.

[DT\\_ENUM\\_UPPER\\_TOKEN\(\)](#) can only be used for properties with string type whose binding has an "enum:". The values in the binding's "enum:" list must be unique after converting non-alphanumeric characters to underscores and capitalizing any letters.

It is an error to use [DT\\_ENUM\\_UPPER\\_TOKEN\(\)](#) in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
    enum:
      - "foo"
      - "123 foo"
```

Example usage:

```
DT_ENUM_TOKEN((DT_NODELABEL(n1), prop) // F00
DT_ENUM_TOKEN((DT_NODELABEL(n2), prop) // 123_F00
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes F00 as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123\_F00 as a token, i.e. it is uppercased and whitespace becomes an underscore.

#### Parameters

- `node_id` – node identifier

- `prop` – lowercase-and-underscores property name with suitable enumeration of values in its binding

**Returns** the value of `prop` as a capitalized token, i.e. upper case, without any quotes, and with special characters converted to underscores

`DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)`

Get a property value from a phandle in a property.

This is a shorthand for:

```
DT_PROP(DT_PHANDLE_BY_IDX(node_id, phs, idx), prop)
```

That is, “`prop`” is a property of the phandle’s node, not a property of “`node_id`”.

Example devicetree fragment:

```
n1: node-1 {
    foo = <&n2 &n3>;
};

n2: node-2 {
    bar = <42>;
};

n3: node-3 {
    baz = <43>;
};
```

Example usage:

```
#define N1 DT_NODELABEL(n1)

DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar) // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz) // 43
```

#### Parameters

- `node_id` – node identifier
- `phs` – lowercase-and-underscores property with type “phandle”, “phandles”, or “phandle-array”
- `idx` – logical index into “`phs`”, which must be zero if “`phs`” has type “phandle”
- `prop` – lowercase-and-underscores property of the phandle’s node

**Returns** the property’s value

`DT_PROP_BY_PHANDLE_IDX_OR(node_id, phs, idx, prop, default_value)`

Like [`DT\_PROP\_BY\_PHANDLE\_IDX\(\)`](#), but with a fallback to `default_value`.

If the value exists, this expands to [`DT\_PROP\_BY\_PHANDLE\_IDX\(node\_id, phs, idx, prop\)`](#). The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

#### Parameters

- `node_id` – node identifier
- `phs` – lowercase-and-underscores property with type “phandle”, “phandles”, or “phandle-array”
- `idx` – logical index into “`phs`”, which must be zero if “`phs`” has type “phandle”

- `prop` – lowercase-and-underscores property of the phandle’s node
- `default_value` – a fallback value to expand to

**Returns** the property’s value

`DT_PROP_BY_PHANDLE(node_id, ph, prop)`

Get a property value from a phandle’s node.

This is equivalent to `DT_PROP_BY_PHANDLE_IDX(node_id, ph, 0, prop)`.

#### Parameters

- `node_id` – node identifier
- `ph` – lowercase-and-underscores property of “node\_id” with type “phandle”
- `prop` – lowercase-and-underscores property of the phandle’s node

**Returns** the property’s value

`DT_PHA_BY_IDX(node_id, pha, idx, cell)`

Get a phandle-array specifier cell value at an index.

It might help to read the argument order as being similar to “node->phandle\_array[index].cell”. That is, the cell value is in the “pha” property of “node\_id”, inside the specifier at index “idx”.

Example devicetree fragment:

```
gpio0: gpio@... {
    #gpio-cells = <2>;
};

gpio1: gpio@... {
    #gpio-cells = <2>;
};

led: led_0 {
    gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```

Bindings fragment for the gpio0 and gpio1 nodes:

```
gpio-cells:
- pin
- flags
```

Above, “gpios” has two elements:

- index 0 has specifier <17 0x1>, so its “pin” cell is 17, and its “flags” cell is 0x1
- index 1 has specifier <5 0x3>, so “pin” is 5 and “flags” is 0x3

Example usage:

```
#define LED DT_NODELABEL(led)

DT_PHA_BY_IDX(LED, gpios, 0, pin) // 17
DT_PHA_BY_IDX(LED, gpios, 1, flags) // 0x3
```

#### Parameters

- `node_id` – node identifier

- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – logical index into “pha”
- `cell` – lowercase-and-underscores cell name within the specifier at “pha” index “idx”

**Returns** the cell’s value

`DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)`

Like [`DT\_PHA\_BY\_IDX\(\)`](#), but with a fallback to `default_value`.

If the value exists, this expands to [`DT\_PHA\_BY\_IDX\(node\_id, pha, idx, cell\)`](#). The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – logical index into “pha”
- `cell` – lowercase-and-underscores cell name within the specifier at “pha” index “idx”
- `default_value` – a fallback value to expand to

**Returns** the cell’s value or “default\_value”

`DT_PHA(node_id, pha, cell)`

Equivalent to [`DT\_PHA\_BY\_IDX\(node\_id, pha, 0, cell\)`](#)

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – lowercase-and-underscores cell name

**Returns** the cell’s value

`DT_PHA_OR(node_id, pha, cell, default_value)`

Like [`DT\_PHA\(\)`](#), but with a fallback to `default_value`.

If the value exists, this expands to [`DT\_PHA\(node\_id, pha, cell\)`](#). The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – lowercase-and-underscores cell name
- `default_value` – a fallback value to expand to

**Returns** the cell’s value or `default_value`

`DT_PHA_BY_NAME(node_id, pha, name, cell)`

Get a value within a phandle-array specifier by name.

This is like [`DT\_PHA\_BY\_IDX\(\)`](#), except it treats “pha” as a structure where each array element has a name.

It might help to read the argument order as being similar to “node->phandle\_struct.name.cell”. That is, the cell value is in the “pha” property of “node\_id”, treated as a data structure where each array element has a name.

Example devicetree fragment:

```
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the “adc1” and “adc2” nodes:

```
io-channel-cells:
- input
```

Example usage:

```
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input) // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input) // 20
```

### Parameters

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of a specifier in “pha”
- `cell` – lowercase-and-underscores cell name in the named specifier

**Returns** the cell’s value

`DT_PHA_BY_NAME_OR(node_id, pha, name, cell, default_value)`

Like [DT\\_PHA\\_BY\\_NAME\(\)](#), but with a fallback to `default_value`.

If the value exists, this expands to [DT\\_PHA\\_BY\\_NAME\(node\\_id, pha, name, cell\)](#). The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

### Parameters

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of a specifier in “pha”
- `cell` – lowercase-and-underscores cell name in the named specifier
- `default_value` – a fallback value to expand to

**Returns** the cell’s value or `default_value`

`DT_PHANDLE_BY_NAME(node_id, pha, name)`

Get a phandle’s node identifier from a phandle array by name.

It might help to read the argument order as being similar to “node->phandle\_struct.name.phandle”. That is, the phandle array is treated as a structure with named elements. The return value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

```
adc1: adc@... {
    label = "ADC_1";
};

adc2: adc@... {
    label = "ADC_2";
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Above, “io-channels” has two elements:

- the element named “SENSOR” has phandle &adc1
- the element named “BANDGAP” has phandle &adc2

Example usage:

```
#define NODE_DT_NODELABEL(n)

DT_LABEL(DT_PHANDLE_BY_NAME(NODE, io_channels, sensor)) // "ADC_1"
DT_LABEL(DT_PHANDLE_BY_NAME(NODE, io_channels, bandgap)) // "ADC_2"
```

Notice how devicetree properties and names are lowercased, and non-alphanumeric characters are converted to underscores.

#### Parameters

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of an element in “pha”

**Returns** a node identifier for the node with that phandle

`DT_PHANDLE_BY_IDX(node_id, prop, idx)`

Get a node identifier for a phandle in a property.

When a node’s value at a logical index contains a phandle, this macro returns a node identifier for the node with that phandle.

Therefore, if “prop” has type “phandle”, “idx” must be zero. (A “phandle” type is treated as a “phandles” with a fixed length of 1).

Example devicetree fragment:

```
n1: node-1 {
    foo = <&n2 &n3>;
};

n2: node-2 { ... };
n3: node-3 { ... };
```

Above, “foo” has type phandles and has two elements:

- index 0 has phandle &n2, which is node-2’s phandle
- index 1 has phandle &n3, which is node-3’s phandle

Example usage:

```
#define N1 DT_NODELABEL(n1)

DT_PHANDLE_BY_IDX(N1, foo, 0) // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1) // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name in “`node_id`” with type “phandle”, “phandles” or “phandle-array”
- `idx` – index into “`prop`”

**Returns** node identifier for the node with the phandle at that index

`DT_PHANDLE(node_id, prop)`

Get a node identifier for a phandle property’s value.

This is equivalent to `DT_PHANDLE_BY_IDX(node_id, prop, 0)`. Its primary benefit is readability when “`prop`” has type “phandle”.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property of “`node_id`” with type “phandle”

**Returns** a node identifier for the node pointed to by “`ph`”

**reg property** Use these APIs instead of [Property access](#) to access the reg property. Because this property’s semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings.

*group devicetree-reg-prop*

### Defines

`DT_NUM_REGS(node_id)`

Get the number of register blocks in the reg property.

Use this instead of `DT_PROP_LEN(node_id, reg)`.

#### Parameters

- `node_id` – node identifier

**Returns** Number of register blocks in the node’s “reg” property.

`DT_REG_HAS_IDX(node_id, idx)`

Is “`idx`” a valid register block index?

If this returns 1, then `DT_REG_ADDR_BY_IDX(node_id, idx)` or `DT_REG_SIZE_BY_IDX(node_id, idx)` are valid. If it returns 0, it is an error to use those macros with index “`idx`”.

#### Parameters

- `node_id` – node identifier
- `idx` – index to check

**Returns** 1 if “`idx`” is a valid register block index, 0 otherwise.

`DT_REG_ADDR_BY_IDX(node_id, idx)`

Get the base address of the register block at index “idx”.

**Parameters**

- `node_id` – node identifier
- `idx` – index of the register whose address to return

**Returns** address of the idx-th register block

`DT_REG_SIZE_BY_IDX(node_id, idx)`

Get the size of the register block at index “idx”.

This is the size of an individual register block, not the total number of register blocks in the property; use [`DT\_NUM\_REGS\(\)`](#) for that.

**Parameters**

- `node_id` – node identifier
- `idx` – index of the register whose size to return

**Returns** size of the idx-th register block

`DT_REG_ADDR(node_id)`

Get a node’s (only) register block address.

Equivalent to [`DT\_REG\_ADDR\_BY\_IDX\(node\_id, 0\)`](#).

**Parameters**

- `node_id` – node identifier

**Returns** node’s register block address

`DT_REG_SIZE(node_id)`

Get a node’s (only) register block size.

Equivalent to [`DT\_REG\_SIZE\_BY\_IDX\(node\_id, 0\)`](#).

**Parameters**

- `node_id` – node identifier

**Returns** node’s only register block’s size

`DT_REG_ADDR_BY_NAME(node_id, name)`

Get a register block’s base address by name.

**Parameters**

- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns** address of the register block specified by name

`DT_REG_SIZE_BY_NAME(node_id, name)`

Get a register block’s size by name.

**Parameters**

- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns** size of the register block specified by name

**interrupts property** Use these APIs instead of *Property access* to access the interrupts property.

Because this property’s semantics are defined by the devicetree specification, some of these macros can be used even for nodes without matching bindings. This does not apply to macros which take cell names as arguments.

group devicetree-interrupts-prop

## Defines

DT\_NUM\_IRQS(*node\_id*)

Get the number of interrupt sources for the node.

Use this instead of *DT\_PROP\_LEN(node\_id, interrupts)*.

### Parameters

- *node\_id* – node identifier

**Returns** Number of interrupt specifiers in the node’s “interrupts” property.

DT\_IRQ\_HAS\_IDX(*node\_id*, *idx*)

Is “*idx*” a valid interrupt index?

If this returns 1, then *DT\_IRQ\_BY\_IDX(node\_id, idx)* is valid. If it returns 0, it is an error to use that macro with this index.

### Parameters

- *node\_id* – node identifier
- *idx* – index to check

**Returns** 1 if the *idx* is valid for the interrupt property 0 otherwise.

DT\_IRQ\_HAS\_CELL\_AT\_IDX(*node\_id*, *idx*, *cell*)

Does an interrupts property have a named cell specifier at an index? If this returns 1, then *DT\_IRQ\_BY\_IDX(node\_id, idx, cell)* is valid. If it returns 0, it is an error to use that macro.

### Parameters

- *node\_id* – node identifier
- *idx* – index to check
- *cell* – named cell value whose existence to check

**Returns** 1 if the named cell exists in the interrupt specifier at index *idx* 0 otherwise.

DT\_IRQ\_HAS\_CELL(*node\_id*, *cell*)

Equivalent to *DT\_IRQ\_HAS\_CELL\_AT\_IDX(node\_id, 0, cell)*

### Parameters

- *node\_id* – node identifier
- *cell* – named cell value whose existence to check

**Returns** 1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

DT\_IRQ\_HAS\_NAME(*node\_id*, *name*)

Does an interrupts property have a named specifier value at an index? If this returns 1, then *DT\_IRQ\_BY\_NAME(node\_id, name, cell)* is valid. If it returns 0, it is an error to use that macro.

### Parameters

- *node\_id* – node identifier

- `name` – lowercase-and-underscores interrupt specifier name

**Returns** 1 if “name” is a valid named specifier 0 otherwise.

`DT_IRQ_BY_IDX(node_id, idx, cell)`

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to “node->interrupts[index].cell”.

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```
my-serial: serial@... {
    interrupts = < 33 0 >, < 34 1 >;
};
```

Assuming the node’s interrupt domain has “#interrupt-cells = <2>,” and the individual cells in each interrupt specifier are named “irq” and “priority” by the node’s binding, here are some examples:

```
#define SERIAL_DT_NODELABEL(my_serial)
```

Example usage	Value
-----	-----
<code>DT_IRQ_BY_IDX(SERIAL, 0, irq)</code>	33
<code>DT_IRQ_BY_IDX(SERIAL, 0, priority)</code>	0
<code>DT_IRQ_BY_IDX(SERIAL, 1, irq,</code>	34
<code>DT_IRQ_BY_IDX(SERIAL, 1, priority)</code>	1

#### Parameters

- `node_id` – node identifier
- `idx` – logical index into the interrupt specifier array
- `cell` – cell name specifier

**Returns** the named value at the specifier given by the index

`DT_IRQ_BY_NAME(node_id, name, cell)`

Get a value within an interrupt specifier by name.

It might help to read the argument order as being similar to “node->interrupts.name.cell”.

This can be used to get information about an individual interrupt when a device generates more than one, if the bindings give each interrupt specifier a name.

#### Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores interrupt specifier name
- `cell` – cell name specifier

**Returns** the named value at the specifier given by the index

`DT_IRQ(node_id, cell)`

Get an interrupt specifier’s value Equivalent to `DT_IRQ_BY_IDX(node_id, 0, cell)`.

#### Parameters

- `node_id` – node identifier
- `cell` – cell name specifier

**Returns** the named value at that index

`DT_IRQN(node_id)`

Get a node's (only) irq number.

Equivalent to `DT_IRQ(node_id, irq)`. This is provided as a convenience for the common case where a node generates exactly one interrupt, and the IRQ number is in a cell named "irq".

**Parameters**

- `node_id` – node identifier

**Returns** the interrupt number for the node's only interrupt

**For-each macros** There is currently only one "generic" for-each macro, `DT_FOREACH_CHILD()`, which allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like `DT_INST_FOREACH_STATUS_OKAY()`, but these require `DT_DRV_COMPAT` to be defined before use.

group devicetree-generic-foreach

## Defines

`DT_FOREACH_CHILD(node_id, fn)`

Invokes "fn" for each child of "node\_id".

The macro "fn" must take one parameter, which will be the node identifier of a child node of "node\_id".

Example devicetree fragment:

```
n: node {
    child-1 {
        label = "foo";
    };
    child-2 {
        label = "bar";
    };
};
```

Example usage:

```
#define LABEL_AND_COMMA(node_id) DT_LABEL(node_id),

const char *child_labels[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), LABEL_AND_COMMA)
};
```

This expands to:

```
const char *child_labels[] = {
    "foo", "bar",
};
```

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke

`DT_FOREACH_CHILD_VARGS(node_id, fn, ...)`

Invokes “fn” for each child of “node\_id” with multiple arguments.

The macro “fn” takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

**See also:**

[\*DT\\_FOREACH\\_CHILD\*](#)

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- ... – variable number of arguments to pass to fn

`DT_FOREACH_CHILD_STATUS_OKAY(node_id, fn)`

Call “fn” on the child nodes with status “okay”.

The macro “fn” should take one argument, which is the node identifier for the child node.

As usual, both a missing status and an “ok” status are treated as “okay”.

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke

`DT_FOREACH_CHILD_STATUS_OKAY_VARGS(node_id, fn, ...)`

Call “fn” on the child nodes with status “okay” with multiple arguments.

The macro “fn” takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

As usual, both a missing status and an “ok” status are treated as “okay”.

**See also:**

[\*DT\\_FOREACH\\_CHILD\\_STATUS\\_OKAY\*](#)

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- ... – variable number of arguments to pass to fn

`DT_FOREACH_PROP_ELEM(node_id, prop, fn)`

Invokes “fn” for each element in the value of property “prop”.

The macro “fn” must take three parameters: `fn(node_id, prop, idx)`. “node\_id” and “prop” are the same as what is passed to `DT_FOREACH_PROP_ELEM`, and “idx” is the current index into the array. The “idx” values are integer literals starting from 0.

Example devicetree fragment:

```
n: node {
    my-ints = <1 2 3>;
};
```

Example usage:

```
#define TIMES_TWO(node_id, prop, idx) \
    (2 * DT_PROP_BY_IDX(node_id, prop, idx)),

int array[] = {
    DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```

This expands to:

```
int array[] = {
    (2 * 1), (2 * 2), (2 * 3),
};
```

In general, this macro expands to:

```
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)
```

where “n” is the number of elements in “prop”, as it would be returned by [DT\\_PROP\\_LEN\(node\\_id, prop\)](#).

The “prop” argument must refer to a property with type string, array, uint8-array, string-array, phandles, or phandle-array. It is an error to use this macro with properties of other types.

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke

`DT_FOREACH_PROP_ELEM_VARGS(node_id, prop, fn, ...)`

Invokes “fn” for each element in the value of property “prop” with multiple arguments.

The macro “fn” must take multiple parameters: `fn(node_id, prop, idx, ...)`. “node\_id” and “prop” are the same as what is passed to `DT_FOREACH_PROP_ELEM`, and “idx” is the current index into the array. The “idx” values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

#### See also:

[DT\\_FOREACH\\_PROP\\_ELEM](#)

#### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- ... – variable number of arguments to pass to fn

`DT_FOREACH_STATUS_OKAY(compat, fn)`

Call “fn” on all nodes with compatible `DT_DRV_COMPAT` and status “okay”.

This macro expands to:

```
fn(node_id_1) fn(node_id_2) ... fn(node_id_n)
```

where each “node\_id\_<i>” is a node identifier for some node with compatible “compat” and status “okay”. Whitespace is added between expansions as shown above.

Example devicetree fragment:

```
/ {
    a {
        compatible = "foo";
        status = "okay";
    };
    b {
        compatible = "foo";
        status = "disabled";
    };
    c {
        compatible = "foo";
    };
};
```

Example usage:

```
DT_FOREACH_STATUS_OKAY(foo, DT_NODE_PATH)
```

This expands to one of the following:

```
"/a" "/c"
"/c" "/a"
```

“One of the following” is because no guarantees are made about the order that node identifiers are passed to “fn” in the expansion.

(The “/c” string literal is present because a missing status property is always treated as if the status were set to “okay”.)

Note also that “fn” is responsible for adding commas, semicolons, or other terminators as needed.

#### Parameters

- `compat` – lowercase-and-underscores devicetree compatible
- `fn` – Macro to call for each enabled node. Must accept a `node_id` as its only parameter.

`DT_FOREACH_STATUS_OKAY_VARS(compat, fn, ...)`

Invokes “fn” for each status “okay” node of a compatible with multiple arguments.

This is like [DT\\_FOREACH\\_STATUS\\_OKAY\(\)](#) except you can also pass additional arguments to “fn”.

Example devicetree fragment:

```
/ {
    a {
        compatible = "foo";
        val = <3>;
    };
    b {
        compatible = "foo";
        val = <4>;
    };
};
```

Example usage:

```
#define MY_FN(node_id, operator) DT_PROP(node_id, val) operator
x = DT_FOREACH_STATUS_OKAY_VARS(foo, MY_FN, +) 0;
```

This expands to one of the following:

```
x = 3 + 4 + 0;
x = 4 + 3 + 0;
```

i.e. it sets `x` to 7. As with `DT_FOREACH_STATUS_OKAY()`, there are no guarantees about the order nodes appear in the expansion.

#### Parameters

- `compat` – lowercase-and-underscores devicetree compatible
- `fn` – Macro to call for each enabled node. Must accept a `node_id` as its only parameter.
- ... – Additional arguments to pass to “fn”

**Existence checks** This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as `DT_IRQ_HAS_IDX()` and all macros which require `DT_DRV_COMPAT`) are documented elsewhere on this page.

`group devicetree-generic-exist`

#### Defines

`DT_NODE_EXISTS(node_id)`

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree.

It doesn’t matter whether or not the node has a matching binding, or what the node’s status value is. This is purely a check of whether the node exists at all.

#### Parameters

- `node_id` – a node identifier

**Returns** 1 if the node identifier refers to a node, 0 otherwise.

`DT_NODE_HAS_STATUS(node_id, status)`

Does a node identifier refer to a node with a status?

Example uses:

```
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), okay)
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), disabled)
```

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an “ok” status in the devicetree is treated as if it were “okay” instead)

#### Parameters

- `node_id` – a node identifier
- `status` – a status as one of the tokens `okay` or `disabled`, not a string

**Returns** 1 if the node has the given status, 0 otherwise.

`DT_HAS_COMPAT_STATUS_OKAY(compat)`

Does the devicetree have a status “okay” node with a compatible?

Test for whether the devicetree has any nodes with status “okay” and the given compatible. That is, this returns 1 if and only if there is at least one “node\_id” for which both of these expressions return 1:

```
DT_NODE_HAS_STATUS(node_id, okay)
DT_NODE_HAS_COMPAT(node_id, compat)
```

As usual, both a missing status and an “ok” status are treated as “okay”.

**Parameters**

- `compat` – lowercase-and-underscores compatible, without quotes

**Returns** 1 if both of the above conditions are met, 0 otherwise

`DT_NUM_INST_STATUS_OKAY(compat)`

Get the number of instances of a given compatible with status “okay”.

**Parameters**

- `compat` – lowercase-and-underscores compatible, without quotes

**Returns** Number of instances with status “okay”

`DT_NODE_HAS_COMPAT(node_id, compat)`

Does a devicetree node match a compatible?

Example devicetree fragment:

```
n: node {
    compatible = "vnd,specific-device", "generic-device";
}
```

Example usages which evaluate to 1:

```
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), vnd_specific_device)
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), generic_device)
```

This macro only uses the value of the compatible property. Whether or not a particular compatible has a matching binding has no effect on its value, nor does the node’s status.

**Parameters**

- `node_id` – node identifier
- `compat` – lowercase-and-underscores compatible, without quotes

**Returns** 1 if the node’s compatible property contains `compat`, 0 otherwise.

`DT_NODE_HAS_COMPAT_STATUS(node_id, compat, status)`

Does a devicetree node have a compatible and status?

This is equivalent to:

```
(DT_NODE_HAS_COMPAT(node_id, compat) &&
DT_NODE_HAS_STATUS(node_id, status))
```

**Parameters**

- `node_id` – node identifier
- `compat` – lowercase-and-underscores compatible, without quotes
- `status` – okay or disabled as a token, not a string

`DT_NODE_HAS_PROP(node_id, prop)`

Does a devicetree node have a property?

Tests whether a devicetree node has a property defined.

This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use [`DT\_PROP\(node\_id, prop\)`](#) instead.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns** 1 if the node has the property, 0 otherwise.

`DT_PHA_HAS_CELL_AT_IDX(node_id, pha, idx, cell)`

Does a phandle array have a named cell specifier at an index?

If this returns 1, then the phandle-array property “pha” has a cell named “cell” at index “idx”, and therefore [`DT\_PHA\_BY\_IDX\(node\_id, pha, idx, cell\)`](#) is valid. If it returns 0, it's an error to use [`DT\_PHA\_BY\_IDX\(\)`](#) with the same arguments.

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – index to check within “pha”
- `cell` – lowercase-and-underscores cell name whose existence to check at index “idx”

**Returns** 1 if the named cell exists in the specifier at index idx, 0 otherwise.

`DT_PHA_HAS_CELL(node_id, pha, cell)`

Equivalent to [`DT\_PHA\_HAS\_CELL\_AT\_IDX\(node\_id, pha, 0, cell\)`](#)

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – lowercase-and-underscores cell name whose existence to check at index “idx”

**Returns** 1 if the named cell exists in the specifier at index 0, 0 otherwise.

**Inter-node dependencies** The `devicetree.h` API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary “depends on” relation between devicetree nodes, which is defined as the [transitive closure](#) of the following “directly depends on” relation:

- every non-root node directly depends on its parent node
- a node directly depends on any nodes its properties refer to by phandle
- a node directly depends on its interrupt-parent if it has an `interrupts` property

A *dependency ordering* of a devicetree is a list of its nodes, where each node `n` appears earlier in the list than any nodes that depend on `n`. A node's *dependency ordinal* is then its zero-based index in that list. Thus, for two distinct devicetree nodes `n1` and `n2` with dependency ordinals `d1` and `d2`, we have:

- `d1 != d2`
- if `n1` depends on `n2`, then `d1 > d2`
- `d1 > d2` does **not** necessarily imply that `n1` depends on `n2`

The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see [DT\\_INST\\_DEP\\_ORD\(\)](#) and subsequent documentation.

group devicetree-dep-ord

## Defines

`DT_DEP_ORD(node_id)`

Get a node's dependency ordinal.

### Parameters

- `node_id` – Node identifier

**Returns** the node's dependency ordinal as an integer literal

`DT_REQUIRES_DEP_ORDS(node_id)`

Get a list of dependency ordinals of a node's direct dependencies.

There is a comma after each ordinal in the expansion, **including** the last one:

```
DT_REQUIRES_DEP_ORDS(my_node) // required_ord_1, ..., required_ord_n,
```

The one case [DT\\_REQUIRES\\_DEP\\_ORDS\(\)](#) expands to nothing is when given the root node identifier `DT_ROOT` as argument. The root has no direct dependencies; every other node at least depends on its parent.

### Parameters

- `node_id` – Node identifier

**Returns** a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

`DT_SUPPORTS_DEP_ORDS(node_id)`

Get a list of dependency ordinals of what depends directly on a node.

There is a comma after each ordinal in the expansion, **including** the last one:

```
DT_SUPPORTS_DEP_ORDS(my_node) // supported_ord_1, ..., supported_ord_n,
```

[DT\\_SUPPORTS\\_DEP\\_ORDS\(\)](#) may expand to nothing. This happens when `node_id` refers to a leaf node that nothing else depends on.

### Parameters

- `node_id` – Node identifier

**Returns** a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

`DT_INST_DEP_ORD(inst)`

Get a `DT_DRV_COMPAT` instance's dependency ordinal.

Equivalent to [DT\\_DEP\\_ORD\(DT\\_DRV\\_INST\(inst\)\)](#).

### Parameters

- `inst` – instance number

**Returns** The instance's dependency ordinal

`DT_INST_REQUIRES_DEP_ORDS(inst)`

Get a list of dependency ordinals of a `DT_DRV_COMPAT` instance's direct dependencies.

Equivalent to `DT_REQUIRES_DEP_ORDS(DT_DRV_INST(inst))`.

#### Parameters

- `inst` – instance number

**Returns** a list of dependency ordinals for the nodes the instance depends on directly

`DT_INST_SUPPORTS_DEP_ORDS(inst)`

Get a list of dependency ordinals of what depends directly on a `DT_DRV_COMPAT` instance.

Equivalent to `DT_SUPPORTS_DEP_ORDS(DT_DRV_INST(inst))`.

#### Parameters

- `inst` – instance number

**Returns** a list of node identifiers for the nodes that depend directly on the instance

**Bus helpers** Zephyr's devicetree bindings language supports a `bus:` key which allows bindings to declare that nodes with a given compatible describe system buses. In this case, child nodes are considered to be on a bus of the given type, and the following APIs may be used.

*group* `devicetree-generic-bus`

## Defines

`DT_BUS(node_id)`

Node's bus controller.

Get the node identifier of the node's bus controller. This can be used with `DT_PROPO` to get properties of the bus controller.

It is an error to use this with nodes which do not have bus controllers.

Example devicetree fragment:

```
i2c@deadbeef {
    label = "I2C_CTLR";
    status = "okay";
    clock-frequency = < 100000 >;

    i2c_device: accelerometer@12 {
        ...
    };
};
```

Example usage:

```
DT_PROP(DT_BUS(DT_NODELABEL(i2c_device)), clock_frequency) // 100000
```

#### Parameters

- `node_id` – node identifier

**Returns** a node identifier for the node's bus controller

`DT_BUS_LABEL(node_id)`

Node's bus controller's label property.

**Parameters**

- `node_id` – node identifier

**Returns** the label property of the node's bus controller *`DT_BUS(node)`*

`DT_ON_BUS(node_id, bus)`

Is a node on a bus of a given type?

Example devicetree overlay:

```
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming “i2c0” is an I2C bus controller node, and therefore “temp” is on an I2C bus:

```
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```

**Parameters**

- `node_id` – node identifier
- `bus` – lowercase-and-underscores bus type as a C token (i.e. without quotes)

**Returns** 1 if the node is on a bus of the given type, 0 otherwise

## Instance-based APIs

These are recommended for use within device drivers. To use them, define `DT_DRV_COMPAT` to the lowercase-and-underscores compatible the device driver implements support for. Here is an example devicetree fragment:

```
serial@40001000 {
    compatible = "vnd,serial";
    status = "okay";
    current-speed = <115200>;
};
```

Example usage, assuming `serial@40001000` is the only enabled node with compatible “vnd,serial”:

```
#define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0)           // node identifier for serial@40001000
DT_INST_PROP(0, current_speed) // 115200
```

**Warning:** Be careful making assumptions about instance numbers. See *`DT_INST()`* for the API guarantees.

As shown above, the `DT_INST_*` APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the *Generic APIs*. The equivalent generic API can be found by removing `INST_` from the macro name. For example, `DT_INST_PROP(inst,`

`prop`) is equivalent to `DT_PROP(DT_DRV_INST(inst), prop)`. Similarly, `DT_INST_REG_ADDR(inst)` is equivalent to `DT_REG_ADDR(DT_DRV_INST(inst))`, and so on. There are some exceptions: [`DT\_ANY\_INST\_ON\_BUS\_STATUS\_OKAY\(\)`](#) and [`DT\_INST\_FOREACH\_STATUS\_OKAY\(\)`](#) are special-purpose helpers without straightforward generic equivalents.

Since `DT_DRV_INST()` requires `DT_DRV_COMPAT` to be defined, it's an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in [Hardware specific APIs](#).

`group devicetree-inst`

## Defines

`DT_DRV_INST(inst)`

Node identifier for an instance of a `DT_DRV_COMPAT` compatible.

### Parameters

- `inst` – instance number

**Returns** a node identifier for the node with `DT_DRV_COMPAT` compatible and instance number “`inst`”

`DT_INST_FOREACH_CHILD(inst, fn)`

Call “`fn`” on all child nodes of [`DT\_DRV\_INST\(inst\)`](#).

The macro “`fn`” should take one argument, which is the node identifier for the child node.

**See also:**

[`DT\_FOREACH\_CHILD`](#)

### Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier

`DT_INST_FOREACH_CHILD_VARGS(inst, fn, ...)`

Call “`fn`” on all child nodes of [`DT\_DRV\_INST\(inst\)`](#).

The macro “`fn`” takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

**See also:**

[`DT\_FOREACH\_CHILD`](#)

### Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier
- `...` – variable number of arguments to pass to `fn`

`DT_INST_PROP(inst, prop)`

Get a `DT_DRV_COMPAT` instance property.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

**Returns** a representation of the property’s value

`DT_INST_PROP_LEN(inst, prop)`

Get a `DT_DRV_COMPAT` property length.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

**Returns** logical length of the property

`DT_INST_PROP_HAS_IDX(inst, prop, idx)`

Is index “`idx`” valid for an array type property on a `DT_DRV_COMPAT` instance?

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `idx` – index to check

**Returns** 1 if “`idx`” is a valid index into the given property, 0 otherwise.

`DT_INST_PROP_BY_IDX(inst, prop, idx)`

Get a `DT_DRV_COMPAT` element value in an array property.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns** a representation of the `idx`-th element of the property

`DT_INST_PROP_OR(inst, prop, default_value)`

Like [`DT\_INST\_PROP\(\)`](#), but with a fallback to `default_value`.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns** [`DT\_INST\_PROP\(inst, prop\)`](#) or `default_value`

`DT_INST_LABEL(inst)`

Get a `DT_DRV_COMPAT` instance’s “label” property.

**Parameters**

- `inst` – instance number

**Returns** instance’s label property value

`DT_INST_PROP_BY_PHANDLE(inst, ph, prop)`

Get a `DT_DRV_COMPAT` instance's property value from a phandle's node.

**Parameters**

- `inst` – instance number
- `ph` – lowercase-and-underscores property of “inst” with type “phandle”
- `prop` – lowercase-and-underscores property of the phandle's node

**Returns** the value of “prop” as described in the [DT\\_PROP\(\)](#) documentation

`DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)`

Get a `DT_DRV_COMPAT` instance's property value from a phandle in a property.

**Parameters**

- `inst` – instance number
- `phs` – lowercase-and-underscores property with type “phandle”, “handles”, or “phandle-array”
- `idx` – logical index into “phs”, which must be zero if “phs” has type “phandle”
- `prop` – lowercase-and-underscores property of the phandle's node

**Returns** the value of “prop” as described in the [DT\\_PROP\(\)](#) documentation

`DT_INST_PHA_BY_IDX(inst, pha, idx, cell)`

Get a `DT_DRV_COMPAT` instance's phandle-array specifier value at an index.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – logical index into the property “pha”
- `cell` – binding's cell name within the specifier at index “idx”

**Returns** the value of the cell inside the specifier at index “idx”

`DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)`

Like [DT\\_INST\\_PHA\\_BY\\_IDX\(\)](#), but with a fallback to `default_value`.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – logical index into the property “pha”
- `cell` – binding's cell name within the specifier at index “idx”
- `default_value` – a fallback value to expand to

**Returns** [DT\\_INST\\_PHA\\_BY\\_IDX\(inst, pha, idx, cell\)](#) or `default_value`

`DT_INST_PHA(inst, pha, cell)`

Get a `DT_DRV_COMPAT` instance's phandle-array specifier value Equivalent to [DT\\_INST\\_PHA\\_BY\\_IDX\(inst, pha, 0, cell\)](#)

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – binding's cell name for the specifier at “pha” index 0

**Returns** the cell value

`DT_INST_PHA_OR(inst, pha, cell, default_value)`

Like [`DT\_INST\_PHAQ`](#), but with a fallback to `default_value`.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – binding’s cell name for the specifier at “pha” index 0
- `default_value` – a fallback value to expand to

**Returns** [`DT\_INST\_PHA\(inst, pha, cell\)`](#) or `default_value`

`DT_INST_PHA_BY_NAME(inst, pha, name, cell)`

Get a `DT_DRV_COMPAT` instance’s value within a phandle-array specifier by name.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of a specifier in “pha”
- `cell` – binding’s cell name for the named specifier

**Returns** the cell value

`DT_INST_PHA_BY_NAME_OR(inst, pha, name, cell, default_value)`

Like [`DT\_INST\_PHA\_BY\_NAMEQ`](#), but with a fallback to `default_value`.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of a specifier in “pha”
- `cell` – binding’s cell name for the named specifier
- `default_value` – a fallback value to expand to

**Returns** [`DT\_INST\_PHA\_BY\_NAME\(inst, pha, name, cell\)`](#) or `default_value`

`DT_INST_PHANDLE_BY_NAME(inst, pha, name)`

Get a `DT_DRV_COMPAT` instance’s phandle node identifier from a phandle array by name.

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `name` – lowercase-and-underscores name of an element in “pha”

**Returns** node identifier for the phandle at the element named “name”

`DT_INST_PHANDLE_BY_IDX(inst, prop, idx)`

Get a `DT_DRV_COMPAT` instance’s node identifier for a phandle in a property.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name in “inst” with type “phandle”, “phandles” or “phandle-array”
- `idx` – index into “prop”

**Returns** a node identifier for the phandle at index “idx” in “prop”

`DT_INST_PHANDLE(inst, prop)`

Get a `DT_DRV_COMPAT` instance’s node identifier for a phandle property’s value.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property of “inst” with type “phandle”

**Returns** a node identifier for the node pointed to by “ph”

`DT_INST_REG_HAS_IDX(inst, idx)`

is “idx” a valid register block index on a `DT_DRV_COMPAT` instance?

**Parameters**

- `inst` – instance number
- `idx` – index to check

**Returns** 1 if “idx” is a valid register block index, 0 otherwise.

`DT_INST_REG_ADDR_BY_IDX(inst, idx)`

Get a `DT_DRV_COMPAT` instance’s idx-th register block’s address.

**Parameters**

- `inst` – instance number
- `idx` – index of the register whose address to return

**Returns** address of the instance’s idx-th register block

`DT_INST_REG_SIZE_BY_IDX(inst, idx)`

Get a `DT_DRV_COMPAT` instance’s idx-th register block’s size.

**Parameters**

- `inst` – instance number
- `idx` – index of the register whose size to return

**Returns** size of the instance’s idx-th register block

`DT_INST_REG_ADDR_BY_NAME(inst, name)`

Get a `DT_DRV_COMPAT`’s register block address by name.

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores register specifier name

**Returns** address of the register block with the given name

`DT_INST_REG_SIZE_BY_NAME(inst, name)`

Get a `DT_DRV_COMPAT`’s register block size by name.

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores register specifier name

**Returns** size of the register block with the given name

`DT_INST_REG_ADDR(inst)`

Get a `DT_DRV_COMPAT`'s (only) register block address.

**Parameters**

- `inst` – instance number

**Returns** instance's register block address

`DT_INST_REG_SIZE(inst)`

Get a `DT_DRV_COMPAT`'s (only) register block size.

**Parameters**

- `inst` – instance number

**Returns** instance's register block size

`DT_INST_IRQ_BY_IDX(inst, idx, cell)`

Get a `DT_DRV_COMPAT` interrupt specifier value at an index.

**Parameters**

- `inst` – instance number
- `idx` – logical index into the interrupt specifier array
- `cell` – cell name specifier

**Returns** the named value at the specifier given by the index

`DT_INST_IRQ_BY_NAME(inst, name, cell)`

Get a `DT_DRV_COMPAT` interrupt specifier value by name.

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores interrupt specifier name
- `cell` – cell name specifier

**Returns** the named value at the specifier given by the index

`DT_INST_IRQ(inst, cell)`

Get a `DT_DRV_COMPAT` interrupt specifier's value.

**Parameters**

- `inst` – instance number
- `cell` – cell name specifier

**Returns** the named value at that index

`DT_INST_IRQN(inst)`

Get a `DT_DRV_COMPAT`'s (only) irq number.

**Parameters**

- `inst` – instance number

**Returns** the interrupt number for the node's only interrupt

`DT_INST_BUS(inst)`

Get a `DT_DRV_COMPAT`'s bus node identifier.

**Parameters**

- `inst` – instance number

**Returns** node identifier for the instance's bus node

`DT_INST_BUS_LABEL(inst)`

Get a `DT_DRV_COMPAT`'s bus node's label property.

**Parameters**

- `inst` – instance number

**Returns** the label property of the instance's bus controller

`DT_INST_ON_BUS(inst, bus)`

Test if a `DT_DRV_COMPAT`'s bus type is a given type.

**Parameters**

- `inst` – instance number
- `bus` – a binding's bus type as a C token, lowercased and without quotes

**Returns** 1 if the given instance is on a bus of the given type, 0 otherwise

`DT_ANY_INST_ON_BUS_STATUS_OKAY(bus)`

Test if any `DT_DRV_COMPAT` node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:

```
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming “i2c0” is an I2C bus controller node, and therefore “temp” is on an I2C bus:

```
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
```

**Parameters**

- `bus` – a binding's bus type as a C token, lowercased and without quotes

**Returns** 1 if any enabled node with that compatible is on that bus type, 0 otherwise

`DT_INST_FOREACH_STATUS_OKAY(fn)`

Call “fn” on all nodes with compatible `DT_DRV_COMPAT` and status “okay”.

This macro calls “fn(inst)” on each “inst” number that refers to a node with status “okay”. Whitespace is added between invocations.

Example devicetree fragment:

```
a {
    compatible = "vnd,device";
    status = "okay";
    label = "DEV_A";
};

b {
```

(continues on next page)

(continued from previous page)

```
        compatible = "vnd,device";
        status = "okay";
        label = "DEV_B";
};

c {
    compatible = "vnd,device";
    status = "disabled";
    label = "DEV_C";
};
```

Example usage:

```
#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_LABEL(inst),

DT_INST_FOREACH_STATUS_OKAY(MY_FN)
```

This expands to:

```
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```
"DEV_A", "DEV_B",
```

or this:

```
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that “fn” is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver’s compatible `DT_DRV_COMPAT`.

#### Parameters

- `fn` – Macro to call for each enabled node. Must accept an instance number as its only parameter.

`DT_INST_FOREACH_STATUS_OKAY_VARGS(fn, ...)`

Call “fn” on all nodes with compatible `DT_DRV_COMPAT` and status “okay” with multiple arguments.

#### See also:

[\*DT\\_INST\\_FOREACH\\_STATUS\\_OKAY\*](#)

#### Parameters

- `fn` – Macro to call for each enabled node. Must accept an instance number as its only parameter.
- `...` – variable number of arguments to pass to `fn`

`DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)`

Invokes “fn” for each element of property “prop” for a `DT_DRV_COMPAT` instance.

Equivalent to `DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn)`.

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke

`DT_INST_FOREACH_PROP_ELEM_VARGS(inst, prop, fn, ...)`

Invokes “fn” for each element of property “prop” for a `DT_DRV_COMPAT` instance with multiple arguments.

Equivalent to `DT_FOREACH_PROP_ELEM_VARGS(DT_DRV_INST(inst), prop, fn, VA_ARGS)`

**See also:**

[`DT\_INST\_FOREACH\_PROP\_ELEM`](#)

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- ... – variable number of arguments to pass to fn

`DT_INST_NODE_HAS_PROP(inst, prop)`

Does a `DT_DRV_COMPAT` instance have a property?

**Parameters**

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

**Returns** 1 if the instance has the property, 0 otherwise.

`DT_INST_PHA_HAS_CELL_AT_IDX(inst, pha, idx, cell)`

Does a phandle array have a named cell specifier at an index for a `DT_DRV_COMPAT` instance?

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `idx` – index to check
- `cell` – named cell value whose existence to check

**Returns** 1 if the named cell exists in the specifier at index `idx`, 0 otherwise.

`DT_INST_PHA_HAS_CELL(inst, pha, cell)`

Does a phandle array have a named cell specifier at index 0 for a `DT_DRV_COMPAT` instance?

**Parameters**

- `inst` – instance number
- `pha` – lowercase-and-underscores property with type “phandle-array”
- `cell` – named cell value whose existence to check

**Returns** 1 if the named cell exists in the specifier at index 0, 0 otherwise.

`DT_INST_IRQ_HAS_IDX(inst, idx)`

is index valid for interrupt property on a `DT_DRV_COMPAT` instance?

**Parameters**

- `inst` – instance number
- `idx` – logical index into the interrupt specifier array

**Returns** 1 if the `idx` is valid for the interrupt property 0 otherwise.

`DT_INST_IRQ_HAS_CELL_AT_IDX(inst, idx, cell)`

Does a `DT_DRV_COMPAT` instance have an interrupt named cell specifier?

**Parameters**

- `inst` – instance number
- `idx` – index to check
- `cell` – named cell value whose existence to check

**Returns** 1 if the named cell exists in the interrupt specifier at index `idx` 0 otherwise.

`DT_INST_IRQ_HAS_CELL(inst, cell)`

Does a `DT_DRV_COMPAT` instance have an interrupt value?

**Parameters**

- `inst` – instance number
- `cell` – named cell value whose existence to check

**Returns** 1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

`DT_INST_IRQ_HAS_NAME(inst, name)`

Does a `DT_DRV_COMPAT` instance have an interrupt value?

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores interrupt specifier name

**Returns** 1 if “name” is a valid named specifier

## Hardware specific APIs

The following APIs can also be used by including `<devicetree.h>`; no additional include is needed.

**Clocks** These conveniences may be used for nodes which describe clock sources, and properties related to them.

*group* `devicetree-clocks`

## Defines

`DT_CLOCKS_CTLR_BY_IDX(node_id, idx)`

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };

clk2: clock-controller@... { ... };

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
};
```

Example usage:

```
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier
- `idx` – logical index into “clocks”

**Returns** the node identifier for the clock controller referenced at index “idx”

`DT_CLOCKS_CTLR(node_id)`

Equivalent to [\*DT\\_CLOCKS\\_CTLR\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_CLOCKS\\_CTLR\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier

**Returns** a node identifier for the clocks controller at index 0 in “clocks”

`DT_CLOCKS_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the controller phandle from a clocks phandle-array property at an index.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };

clk2: clock-controller@... { ... };

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
    clock-names = "alpha", "beta";
};
```

Example usage:

```
DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `node_id` – node identifier
- `name` – lowercase-and-underscores name of a clocks element as defined by the node's `clock-names` property

**Returns** the node identifier for the clock controller referenced by name

`DT_CLOCKS_LABEL_BY_IDX(node_id, idx)`

Get a label property from the node referenced by a `pwms` property at an index.

It's an error if the clock controller node referenced by the phandle in `node_id`'s `clocks` property at index “`idx`” has no label property.

Example devicetree fragment:

```
clk1: clock-controller@... {
    label = "CLK_1";
};

clk2: clock-controller@... {
    label = "CLK_2";
};

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
};
```

Example usage:

```
DT_CLOCKS_LABEL_BY_IDX(DT_NODELABEL(n), 1) // "CLK_2"
```

**See also:**

[\*DT\\_PROP\\_BY\\_PHANDLE\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a `clocks` property
- `idx` – logical index into `clocks` property

**Returns** the label property of the node referenced at index “`idx`”

`DT_CLOCKS_LABEL_BY_NAME(node_id, name)`

Get a label property from a `clocks` property by name.

It's an error if the clock controller node referenced by the phandle in `node_id`'s `clocks` property at the element named “`name`” has no label property.

Example devicetree fragment:

```
clk1: clock-controller@... {
    label = "CLK_1";
};

clk2: clock-controller@... {
    label = "CLK_2";
};

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
};
```

(continues on next page)

(continued from previous page)

```
clock-names = "alpha", "beta";
};
```

Example usage:

```
DT_CLOCKS_LABEL_BY_NAME(DT_NODELABEL(n), beta) // "CLK_2"
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a clocks property
- `name` – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property

**Returns** the label property of the node referenced at the named element

`DT_CLOCKS_LABEL(node_id)`

Equivalent to [\*DT\\_CLOCKS\\_LABEL\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_CLOCKS\\_LABEL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a clocks property

**Returns** the label property of the node referenced at index 0

`DT_CLOCKS_CELL_BY_IDX(node_id, idx, cell)`

Get a clock specifier's cell value at an index.

Example devicetree fragment:

```
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};
```

Bindings fragment for the vnd,clock compatible:

```
clock-cells:
- bus
- bits
```

Example usage:

```
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 0, bus) // 10
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 1, bits) // 40
```

**See also:**

[\*DT\\_PHA\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a clocks property
- `idx` – logical index into clocks property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_CLOCKS_CELL_BY_NAME(node_id, name, cell)`

Get a clock specifier’s cell value by name.

Example devicetree fragment:

```
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
    clock-names = "alpha", "beta";
};
```

Bindings fragment for the vnd,clock compatible:

```
clock-cells:
- bus
- bits
```

Example usage:

```
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus) // 10
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40
```

**See also:**

[\*DT\\_PHA\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a clocks property
- `name` – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_CLOCKS_CELL(node_id, cell)`

Equivalent to [\*DT\\_CLOCKS\\_CELL\\_BY\\_IDX\(node\\_id, 0, cell\)\*](#)

**See also:**

[\*DT\\_CLOCKS\\_CELL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a clocks property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index 0

`DT_INST_CLOCKS_CTLR_BY_IDX(inst, idx)`

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

**See also:**

[\*DT\\_CLOCKS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – instance number
- `idx` – logical index into “clocks”

**Returns** the node identifier for the clock controller referenced at index “idx”

`DT_INST_CLOCKS_CTLR(inst)`

Equivalent to [\*DT\\_INST\\_CLOCKS\\_CTLR\\_BY\\_IDX\(inst, 0\)\*](#)

**See also:**

[\*DT\\_CLOCKS\\_CTLR\(\)\*](#)

**Parameters**

- `inst` – instance number

**Returns** a node identifier for the clocks controller at index 0 in “clocks”

`DT_INST_CLOCKS_CTLR_BY_NAME(inst, name)`

Get the node identifier for the controller phandle from a clocks phandle-array property by name.

**See also:**

[\*DT\\_CLOCKS\\_CTLR\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

**Returns** the node identifier for the clock controller referenced by the named element

`DT_INST_CLOCKS_LABEL_BY_IDX(inst, idx)`

Get a label property from a `DT_DRV_COMPAT` instance’s clocks property at an index.

**See also:**

[\*DT\\_CLOCKS\\_LABEL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into clocks property

**Returns** the label property of the node referenced at index “idx”

`DT_INST_CLOCKS_LABEL_BY_NAME(inst, name)`

Get a label property from a `DT_DRV_COMPAT` instance’s clocks property by name.

**See also:**

[\*DT\\_CLOCKS\\_LABEL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

**Returns** the label property of the node referenced at the named element

`DT_INST_CLOCKS_LABEL(inst)`

Equivalent to [\*DT\\_INST\\_CLOCKS\\_LABEL\\_BY\\_IDX\(inst, 0\)\*](#)

**See also:**

[\*DT\\_CLOCKS\\_LABEL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** the label property of the node referenced at index 0

`DT_INST_CLOCKS_CELL_BY_IDX(inst, idx, cell)`

Get a `DT_DRV_COMPAT` instance’s clock specifier’s cell value at an index.

**See also:**

[\*DT\\_CLOCKS\\_CELL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into clocks property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)`

Get a `DT_DRV_COMPAT` instance’s clock specifier’s cell value by name.

**See also:**

[\*DT\\_CLOCKS\\_CELL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_INST_CLOCKS_CELL(inst, cell)`

Equivalent to `DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)`

#### Parameters

- `inst` – `DT_DRV_COMPAT` instance number
- `cell` – lowercase-and-underscores cell name

**Returns** the value of the cell inside the specifier at index 0

**DMA** These conveniences may be used for nodes which describe direct memory access controllers or channels, and properties related to them.

`group devicetree-dmas`

### Defines

`DT_DMAS_LABEL_BY_IDX(node_id, idx)`

Get a label property from the node referenced by a `dmas` property at an index.

It's an error if the DMA controller node referenced by the phandle in `node_id`'s `dmas` property at index “`idx`” has no label property.

Example devicetree fragment:

```
dma1: dma@... {
    label = "DMA_1";
};

dma2: dma@... {
    label = "DMA_2";
};

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
          <&dma2 6 3 0x404 0x5>;
};
```

Example usage:

```
DT_DMAS_LABEL_BY_IDX(DT_NODELABEL(n), 1) // "DMA_2"
```

#### Parameters

- `node_id` – node identifier for a node with a `dmas` property
- `idx` – logical index into `dmas` property

**Returns** the label property of the node referenced at index “`idx`”

`DT_INST_DMAS_LABEL_BY_IDX(inst, idx)`

Get a label property from a `DT_DRV_COMPAT` instance's `dmas` property at an index.

See also:

[\*DT\\_DMAS\\_LABEL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into dmas property

**Returns** the label property of the node referenced at index “idx”

`DT_DMAS_LABEL_BY_NAME(node_id, name)`

Get a label property from a dmas property by name.

It’s an error if the DMA controller node referenced by the phandle in `node_id`’s dmas property at the element named “name” has no label property.

Example devicetree fragment:

```
dma1: dma@... {
    label = "DMA_1";
};

dma2: dma@... {
    label = "DMA_2";
};

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
          <&dma2 6 3 0x404 0x5>;
    dma-names = "tx", "rx";
};
```

Example usage:

```
DT_DMAS_LABEL_BY_NAME(DT_NODELABEL(n), rx) // "DMA_2"
```

#### Parameters

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

**Returns** the label property of the node referenced at the named element

`DT_DMAS_CTLR_BY_IDX(node_id, idx)`

Get the node identifier for the DMA controller from a dmas property at an index.

Example devicetree fragment:

```
dma1: dma@... { ... };

dma2: dma@... { ... };

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
          <&dma2 6 3 0x404 0x5>;
};
```

Example usage:

```
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(dma2)
```

**See also:**

[\*DT\\_PROP\\_BY\\_PHANDLE\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a `dmass` property
- `idx` – logical index into `dmass` property

**Returns** the node identifier for the DMA controller referenced at index “`idx`”

`DT_DMAS_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the DMA controller from a `dmass` property by name.

Example devicetree fragment:

```
dma1: dma@... { ... };

dma2: dma@... { ... };

n: node {
    dmass = <&dma1 1 2 0x400 0x3>,
           <&dma2 6 3 0x404 0x5>;
    dma-names = "tx", "rx";
};
```

Example usage:

```
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a `dmass` property
- `name` – lowercase-and-underscores name of a `dmass` element as defined by the node’s `dma-names` property

**Returns** the node identifier for the DMA controller in the named element

`DT_DMAS_CTLR(node_id)`

Equivalent to [\*DT\\_DMAS\\_CTLR\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_DMAS\\_CTLR\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a `dmass` property

**Returns** the node identifier for the DMA controller at index 0 in the node’s “`dmass`” property

`DT_INST_DMAS_LABEL_BY_NAME(inst, name)`

Get a label property from a `DT_DRV_COMPAT` instance's `dmass` property by name.

**See also:**

[\*DT\\_DMAS\\_LABEL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a `dmass` element as defined by the node's `dma-names` property

**Returns** the label property of the node referenced at the named element

`DT_INST_DMAS_CTLR_BY_IDX(inst, idx)`

Get the node identifier for the DMA controller from a `DT_DRV_COMPAT` instance's `dmass` property at an index.

**See also:**

[\*DT\\_DMAS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into `dmass` property

**Returns** the node identifier for the DMA controller referenced at index “`idx`”

`DT_INST_DMAS_CTLR_BY_NAME(inst, name)`

Get the node identifier for the DMA controller from a `DT_DRV_COMPAT` instance's `dmass` property by name.

**See also:**

[\*DT\\_DMAS\\_CTLR\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a `dmass` element as defined by the node's `dma-names` property

**Returns** the node identifier for the DMA controller in the named element

`DT_INST_DMAS_CTLR(inst)`

Equivalent to [\*DT\\_INST\\_DMAS\\_CTLR\\_BY\\_IDX\(inst, 0\)\*](#)

**See also:**

[\*DT\\_DMAS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** the node identifier for the DMA controller at index 0 in the instance’s “dmas” property

`DT_DMAS_CELL_BY_IDX(node_id, idx, cell)`

Get a DMA specifier’s cell value at an index.

Example devicetree fragment:

```
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
          <&dma2 6 0x404>;
};
```

Bindings fragment for the vnd,dma compatible:

```
dma-cells:
- channel
- config
```

Example usage:

```
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 6
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, config) // 0x400
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, config) // 0x404
```

**See also:**

[\*DT\\_PHA\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a dmas property
- `idx` – logical index into dmas property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_INST_DMAS_CELL_BY_IDX(inst, idx, cell)`

Get a DT\_DRV\_COMPAT instance’s DMA specifier’s cell value at an index.

**See also:**

[\*DT\\_DMAS\\_CELL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into dmas property

- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_DMAS_CELL_BY_NAME(node_id, name, cell)`

Get a DMA specifier’s cell value by name.

Example devicetree fragment:

```
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
          <&dma2 6 0x404>;
    dma-names = "tx", "rx";
};
```

Bindings fragment for the vnd,dma compatible:

```
dma-cells:
- channel
- config
```

Example usage:

```
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

**See also:**

[\*DT\\_PHA\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_INST_DMAS_CELL_BY_NAME(inst, name, cell)`

Get a DT\_DRV\_COMPAT instance’s DMA specifier’s cell value by name.

**See also:**

[\*DT\\_DMAS\\_CELL\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `inst` – DT\_DRV\_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's `dma-names` property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_DMAS_HAS_IDX(node_id, idx)`

Is index “`idx`” valid for a dmas property?

**Parameters**

- `node_id` – node identifier for a node with a dmas property
- `idx` – logical index into dmas property

**Returns** 1 if the “dmas” property has index “`idx`”, 0 otherwise

`DT_INST_DMAS_HAS_IDX(inst, idx)`

Is index “`idx`” valid for a DT\_DRV\_COMPAT instance's dmas property?

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into dmas property

**Returns** 1 if the “dmas” property has a specifier at index “`idx`”, 0 otherwise

`DT_DMAS_HAS_NAME(node_id, name)`

Does a dmas property have a named element?

**Parameters**

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's `dma-names` property

**Returns** 1 if the dmas property has the named element, 0 otherwise

`DT_INST_DMAS_HAS_NAME(inst, name)`

Does a DT\_DRV\_COMPAT instance's dmas property have a named element?

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's `dma-names` property

**Returns** 1 if the dmas property has the named element, 0 otherwise

**Fixed flash partitions** These conveniences may be used for the special-purpose `fixed-partitions` compatible used to encode information about flash memory partitions in the device tree. See [dts/bindings/mtd/partition.yaml](#) for this compatible's binding.

*group* `devicetree-fixed-partition`

**Defines**

`DT_NODE_BY_FIXED_PARTITION_LABEL(label)`

Get a node identifier for a fixed partition with a given label property.

Example devicetree fragment:

```
flash@... {
    partitions {
        compatible = "fixed-partitions";
        boot_partition: partition@0 {
            label = "mcuboot";
        };
        slot0_partition: partition@c000 {
            label = "image-0";
        };
        ...
    };
};
```

Example usage:

```
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_
↪partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_
↪partition
```

#### Parameters

- `label` – lowercase-and-underscores label property value

**Returns** a node identifier for the partition with that label property

`DT_HAS_FIXED_PARTITION_LABEL(label)`

Test if a fixed partition with a given label property exists.

#### Parameters

- `label` – lowercase-and-underscores label property value

**Returns** 1 if any “fixed-partitions” child node has the given label, 0 otherwise.

`DT_FIXED_PARTITION_ID(node_id)`

Get a numeric identifier for a fixed partition.

#### Parameters

- `node_id` – node identifier for a fixed-partitions child node

**Returns** the partition’s ID, a unique zero-based index number

`DT_MTD_FROM_FIXED_PARTITION(node_id)`

Get the node identifier of the flash device for a partition.

#### Parameters

- `node_id` – node identifier for a fixed-partitions child node

**Returns** the node identifier of the memory technology device that contains the fixed-partitions node.

**GPIO** These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

*group devicetree-gpio*

## Defines

`DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, idx)`

Get the node identifier for the controller phandle from a gpio phandle-array property at an index.

Example devicetree fragment:

```
gpio1: gpio@... { };
gpio2: gpio@... { };

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```
DT_GPIO_CTLR_BY_IDX(DT_NODELABEL(n), gpios, 1) // DT_NODELABEL(gpio2)
```

**See also:**

[`DT\_PHANDLE\_BY\_IDX\(\)`](#)

### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the node identifier for the gpio controller referenced at index “idx”

`DT_GPIO_CTLR(node_id, gpio_pha)`

Equivalent to [`DT\_GPIO\_CTLR\_BY\_IDX\(node\_id, gpio\_pha, 0\)`](#)

**See also:**

[`DT\_GPIO\_CTLR\_BY\_IDX\(\)`](#)

### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** a node identifier for the gpio controller at index 0 in “gpio\_pha”

`DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, idx)`

Get a label property from a gpio phandle-array property at an index.

It’s an error if the GPIO controller node referenced by the phandle in `node_id`’s “gpio\_pha” property at index “idx” has no label property.

Example devicetree fragment:

```
gpio1: gpio@... {
    label = "GPIO_1";
};

gpio2: gpio@... {
    label = "GPIO_2";
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```
DT_GPIO_LABEL_BY_IDX(DT_NODELABEL(n), gpios, 1) // "GPIO_2"
```

See also:

[\*DT\\_PHANDLE\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the label property of the node referenced at index “idx”

`DT_GPIO_LABEL(node_id, gpio_pha)`

Equivalent to [\*DT\\_GPIO\\_LABEL\\_BY\\_IDX\(node\\_id, gpio\\_pha, 0\)\*](#)

See also:

[\*DT\\_GPIO\\_LABEL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the label property of the node referenced at index 0

`DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)`

Get a GPIO specifier’s pin cell at an index.

This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
```

(continues on next page)

(continued from previous page)

```

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};

```

Bindings fragment for the vnd,gpio compatible:

```

gpio-cells:
- pin
- flags

```

Example usage:

```

DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30

```

See also:

[DT\\_PHA\\_BY\\_IDX\(\)](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the pin cell value at index “idx”

`DT_GPIO_PIN(node_id, gpio_pha)`

Equivalent to [DT\\_GPIO\\_PIN\\_BY\\_IDX\(node\\_id, gpio\\_pha, 0\)](#)

See also:

[DT\\_GPIO\\_PIN\\_BY\\_IDX\(\)](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the pin cell value at index 0

`DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, idx)`

Get a GPIO specifier’s flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
- pin
- flags
```

Example usage:

```
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 0) // GPIO_ACTIVE_LOW
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 1) // GPIO_ACTIVE_HIGH
```

**See also:**

[DT\\_PHA\\_BY\\_IDX\(\)](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the flags cell value at index “idx”, or zero if there is none

`DT_GPIO_FLAGS(node_id, gpio_pha)`

Equivalent to [DT\\_GPIO\\_FLAGS\\_BY\\_IDX\(node\\_id, gpio\\_pha, 0\)](#)

**See also:**

[DT\\_GPIO\\_FLAGS\\_BY\\_IDX\(\)](#)

#### Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the flags cell value at index 0, or zero if there is none

`DT_INST_GPIO_LABEL_BY_IDX(inst, gpio_pha, idx)`

Get a label property from a `DT_DRV_COMPAT` instance’s GPIO property at an index.

#### Parameters

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the label property of the node referenced at index “idx”

`DT_INST_GPIO_LABEL(inst, gpio_pha)`

Equivalent to [`DT\_INST\_GPIO\_LABEL\_BY\_IDX\(inst, gpio\_pha, 0\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the label property of the node referenced at index 0

`DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, idx)`

Get a DT\_DRV\_COMPAT instance’s GPIO specifier’s pin cell value at an index.

**See also:**

[`DT\_GPIO\_PIN\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the pin cell value at index “idx”

`DT_INST_GPIO_PIN(inst, gpio_pha)`

Equivalent to [`DT\_INST\_GPIO\_PIN\_BY\_IDX\(inst, gpio\_pha, 0\)`](#)

**See also:**

[`DT\_INST\_GPIO\_PIN\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the pin cell value at index 0

`DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, idx)`

Get a DT\_DRV\_COMPAT instance’s GPIO specifier’s flags cell at an index.

**See also:**

[`DT\_GPIO\_FLAGS\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio\_pha”

**Returns** the flags cell value at index “idx”, or zero if there is none

`DT_INST_GPIO_FLAGS(inst, gpio_pha)`

Equivalent to [`DT\_INST\_GPIO\_FLAGS\_BY\_IDX\(inst, gpio\_pha, 0\)`](#)

**See also:**

[`DT\_INST\_GPIO\_FLAGS\_BY\_IDX\(\)`](#)

#### Parameters

- `inst` – DT\_DRV\_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns** the flags cell value at index 0, or zero if there is none

**IO channels** These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

*group* `devicetree-io-channels`

#### Defines

`DT_IO_CHANNELS_LABEL_BY_IDX(node_id, idx)`

Get a label property from the node referenced by an io-channels property at an index.

It’s an error if the node referenced by the phandle in `node_id`’s io-channels property at index “idx” has no label property.

Example devicetree fragment:

```
adc1: adc@... {
    label = "ADC_1";
};

adc2: adc@... {
    label = "ADC_2";
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:

```
DT_IO_CHANNELS_LABEL_BY_IDX(DT_NODELABEL(n), 1) // "ADC_2"
```

**See also:**

[`DT\_PROP\_BY\_PHANDLE\_IDX\(\)`](#)

**Parameters**

- `node_id` – node identifier for a node with an `io-channels` property
- `idx` – logical index into `io-channels` property

**Returns** the label property of the node referenced at index “`idx`”

`DT_IO_CHANNELS_LABEL_BY_NAME(node_id, name)`

Get a label property from an `io-channels` property by name.

It’s an error if the node referenced by the phandle in `node_id`’s `io-channels` property at the element named “`name`” has no label property.

Example devicetree fragment:

```
adc1: adc@... {
    label = "ADC_1";
};

adc2: adc@... {
    label = "ADC_2";
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Example usage:

```
DT_IO_CHANNELS_LABEL_BY_NAME(DT_NODELABEL(n), bandgap) // "ADC_2"
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with an `io-channels` property
- `name` – lowercase-and-underscores name of an `io-channels` element as defined by the node’s `io-channel-names` property

**Returns** the label property of the node referenced at the named element

`DT_IO_CHANNELS_LABEL(node_id)`

Equivalent to [\*DT\\_IO\\_CHANNELS\\_LABEL\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_IO\\_CHANNELS\\_LABEL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with an `io-channels` property

**Returns** the label property of the node referenced at index 0

`DT_IO_CHANNELS_CTLR_BY_IDX(node_id, idx)`

Get the node identifier for the node referenced by an `io-channels` property at an index.

Example devicetree fragment:

```
adc1: adc@... { ... };

adc2: adc@... { ... };

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:

```
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)
```

**See also:**

[\*DT\\_PROP\\_BY\\_PHANDLE\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with an io-channels property
- `idx` – logical index into io-channels property

**Returns** the node identifier for the node referenced at index “idx”

`DT_IO_CHANNELS_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the node referenced by an io-channels property by name.

Example devicetree fragment:

```
adc1: adc@... { ... };

adc2: adc@... { ... };

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Example usage:

```
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), sensor) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), bandgap) // DT_NODELABEL(adc2)
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with an io-channels property
- `name` – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

**Returns** the node identifier for the node referenced at the named element

`DT_IO_CHANNELS_CTLR(node_id)`

Equivalent to [\*DT\\_IO\\_CHANNELS\\_CTLR\\_BY\\_IDX\(node\\_id, 0\)\*](#)

See also:

[\*DT\\_IO\\_CHANNELS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with an `io-channels` property

**Returns** the node identifier for the node referenced at index 0 in the node’s “`io-channels`” property

`DT_INST_IO_CHANNELS_LABEL_BY_IDX(inst, idx)`

Get a label property from a `DT_DRV_COMPAT` instance’s `io-channels` property at an index.

See also:

[\*DT\\_IO\\_CHANNELS\\_LABEL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into `io-channels` property

**Returns** the label property of the node referenced at index “`idx`”

`DT_INST_IO_CHANNELS_LABEL_BY_NAME(inst, name)`

Get a label property from a `DT_DRV_COMPAT` instance’s `io-channels` property by name.

See also:

[\*DT\\_IO\\_CHANNELS\\_LABEL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of an `io-channels` element as defined by the instance’s `io-channel-names` property

**Returns** the label property of the node referenced at the named element

`DT_INST_IO_CHANNELS_LABEL(inst)`

Equivalent to [\*DT\\_INST\\_IO\\_CHANNELS\\_LABEL\\_BY\\_IDX\(inst, 0\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** the label property of the node referenced at index 0

`DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, idx)`

Get the node identifier from a `DT_DRV_COMPAT` instance’s `io-channels` property at an index.

See also:

[\*DT\\_IO\\_CHANNELS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into `io-channels` property

**Returns** the node identifier for the node referenced at index “idx”

`DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)`

Get the node identifier from a `DT_DRV_COMPAT` instance’s `io-channels` property by name.

**See also:**

[\*DT\\_IO\\_CHANNELS\\_CTLR\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of an `io-channels` element as defined by the node’s `io-channel-names` property

**Returns** the node identifier for the node referenced at the named element

`DT_INST_IO_CHANNELS_CTLR(inst)`

Equivalent to [\*DT\\_INST\\_IO\\_CHANNELS\\_CTLR\\_BY\\_IDX\(inst, 0\)\*](#)

**See also:**

[\*DT\\_IO\\_CHANNELS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** the node identifier for the node referenced at index 0 in the node’s “`io-channels`” property

`DT_IO_CHANNELS_INPUT_BY_IDX(node_id, idx)`

Get an `io-channels` specifier input cell at an index.

This macro only works for `io-channels` specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```
adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Bindings fragment for the `vnd,adc` compatible:

`io-channel-cells`:

- `input`

Example usage:

```
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 0) // 10
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 1) // 20
```

**See also:**

[\*DT\\_PHA\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with an io-channels property
- `idx` – logical index into io-channels property

**Returns** the input cell in the specifier at index “idx”

`DT_IO_CHANNELS_INPUT_BY_NAME(node_id, name)`

Get an io-channels specifier input cell by name.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```
adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

- input

Example usage:

```
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), sensor) // 10
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), bandgap) // 20
```

**See also:**

[\*DT\\_PHA\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with an io-channels property
- `name` – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

**Returns** the input cell in the specifier at the named element

`DT_IO_CHANNELS_INPUT(node_id)`

Equivalent to [`DT\_IO\_CHANNELS\_INPUT\_BY\_IDX\(node\_id, 0\)`](#)

**See also:**

[`DT\_IO\_CHANNELS\_INPUT\_BY\_IDX\(\)`](#)

**Parameters**

- `node_id` – node identifier for a node with an `io-channels` property

**Returns** the input cell in the specifier at index 0

`DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, idx)`

Get an input cell from the “`DT_DRV_INST(inst)`” `io-channels` property at an index.

**See also:**

[`DT\_IO\_CHANNELS\_INPUT\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into `io-channels` property

**Returns** the input cell in the specifier at index “`idx`”

`DT_INST_IO_CHANNELS_INPUT_BY_NAME(inst, name)`

Get an input cell from the “`DT_DRV_INST(inst)`” `io-channels` property by name.

**See also:**

[`DT\_IO\_CHANNELS\_INPUT\_BY\_NAME\(\)`](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of an `io-channels` element as defined by the instance’s `io-channel-names` property

**Returns** the input cell in the specifier at the named element

`DT_INST_IO_CHANNELS_INPUT(inst)`

Equivalent to [`DT\_INST\_IO\_CHANNELS\_INPUT\_BY\_IDX\(inst, 0\)`](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** the input cell in the specifier at index 0

**Pinctrl (pin control)** These are used to access pin control properties by name or index.

Devicetree nodes may have properties which specify pin control (sometimes known as pin mux) settings. These are expressed using `pinctrl-<index>` properties within the node, where the `<index>` values are contiguous integers starting from 0. These may also be named using the `pinctrl-names` property.

Here is an example:

```
node {
    ...
    pinctrl-0 = <&foo &bar ...>;
    pinctrl-1 = <&baz ...>;
    pinctrl-names = "default", "sleep";
};
```

Above, pinctrl-0 has name "default", and pinctrl-1 has name "sleep". The pinctrl-<index> property values contain handles. The &foo, &bar, etc. handles within the properties point to nodes whose contents vary by platform, and which describe a pin configuration for the node.

group devicetree-pinctrl

## Defines

DT\_PINCTRL\_BY\_IDX(node\_id, pc\_idx, idx)

Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
}
```

Example usage:

```
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

### Parameters

- node\_id – node with a pinctrl-‘pc\_idx’ property
- pc\_idx – index of the pinctrl property itself
- idx – index into the value of the pinctrl property

**Returns** node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc\_idx’”

DT\_PINCTRL\_0(node\_id, idx)

Get a node identifier from a pinctrl-0 property.

This is equivalent to:

```
DT_PINCTRL_BY_IDX(node_id, 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

### Parameters

- node\_id – node with a pinctrl-0 property
- idx – index into the pinctrl-0 property

**Returns** node identifier for the phandle at index idx in the pinctrl-0 property of that node

DT\_PINCTRL\_BY\_NAME(node\_id, name, idx)

Get a node identifier for a phandle inside a pinctrl node by name.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0) // DT_NODELABEL(baz)
```

#### Parameters

- `node_id` – node with a named pinctrl property
- `name` – lowercase-and-underscores pinctrl property name
- `idx` – index into the value of the named pinctrl property

**Returns** node identifier for the handle at that index in the pinctrl property

`DT_PINCTRL_NAME_TO_IDX(node_id, name)`

Convert a pinctrl name to its corresponding index.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), default) // 0
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), sleep) // 1
```

#### Parameters

- `node_id` – node identifier with a named pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl whose index to get

**Returns** integer literal for the index of the pinctrl property with that name

`DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)`

Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property’s name, and “remove the quotes” from it.

[`DT\_PINCTRL\_IDX\_TO\_NAME\_TOKEN\(\)`](#) can only be used if the node has a pinctrl-‘pc\_idx’ property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // f_o_o2
```

The same caveats and restrictions that apply to [DT\\_STRING\\_TOKEN\(\)](#)'s return value also apply here.

#### Parameters

- `node_id` – node identifier
- `pc_idx` – index of a pinctrl property in that node

**Returns** name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

`DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(node_id, pc_idx)`

Like [DT\\_PINCTRL\\_IDX\\_TO\\_NAME\\_TOKEN\(\)](#), but with an uppercased result.

This does the a similar conversion as [DT\\_PINCTRL\\_IDX\\_TO\\_NAME\\_TOKEN\(node\\_id, pc\\_idx\)](#). The only difference is that alphabetical characters in the result are uppercased.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_O_O2
```

The same caveats and restrictions that apply to [DT\\_STRING\\_UPPER\\_TOKEN\(\)](#)'s return value also apply here.

`DT_NUM_PINCTRLS_BY_IDX(node_id, pc_idx)`

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <&foo &bar>;
};

n2: node-2 {
    pinctrl-0 = <&baz>;
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

**Parameters**

- `node_id` – node identifier with a `pinctrl` property
- `pc_idx` – index of the `pinctrl` property itself

**Returns** number of phandles in the property with that index

`DT_NUM_PINCTRLS_BY_NAME(node_id, name)`

Like [DT\\_NUM\\_PINCTRLS\\_BY\\_IDX\(\)](#), but by name instead.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz>
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep)    // 1
```

**Parameters**

- `node_id` – node identifier with a `pinctrl` property
- `name` – lowercase-and-underscores name name of the `pinctrl` property

**Returns** number of phandles in the property with that name

`DT_NUM_PINCTRL_STATES(node_id)`

Get the number of `pinctrl` properties in a node.

This expands to 0 if there are no `pinctrl-i` properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n2)) // 0
```

**Parameters**

- `node_id` – node identifier; may or may not have any `pinctrl` properties

**Returns** number of `pinctrl` properties in the node

`DT_PINCTRL_HAS_IDX(node_id, pc_idx)`

Test if a node has a `pinctrl` property with an index.

This expands to 1 if the `pinctrl-idx` property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0
```

#### Parameters

- `node_id` – node identifier; may or may not have any pinctrl properties
- `pc_idx` – index of a pinctrl property whose existence to check

**Returns** 1 if the property exists, 0 otherwise

`DT_PINCTRL_HAS_NAME(node_id, name)`

Test if a node has a pinctrl property with a name.

This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-names = "default";
};

n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep)    // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

#### Parameters

- `node_id` – node identifier; may or may not have any pinctrl properties
- `name` – lowercase-and-underscores pinctrl property name to check

**Returns** 1 if the property exists, 0 otherwise

`DT_INST_PINCTRL_BY_IDX(inst, pc_idx, idx)`

Get a node identifier for a phandle in a pinctrl property by index for a `DT_DRV_COMPAT` instance.

This is equivalent to `DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx)`.

#### Parameters

- `inst` – instance number

- `pc_idx` – index of the pinctrl property itself
- `idx` – index into the value of the pinctrl property

**Returns** node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc\_idx’”

`DT_INST_PINCTRL_0(inst, idx)`

Get a node identifier from a pinctrl-0 property for a `DT_DRV_COMPAT` instance.

This is equivalent to:

```
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

**Parameters**

- `inst` – instance number
- `idx` – index into the pinctrl-0 property

**Returns** node identifier for the phandle at index `idx` in the pinctrl-0 property of that instance

`DT_INST_PINCTRL_BY_NAME(inst, name, idx)`

Get a node identifier for a phandle inside a pinctrl node for a `DT_DRV_COMPAT` instance.

This is equivalent to [`DT\_PINCTRL\_BY\_NAME\(DT\_DRV\_INST\(inst\), name, idx\)`](#).

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores pinctrl property name
- `idx` – index into the value of the named pinctrl property

**Returns** node identifier for the phandle at that index in the pinctrl property

`DT_INST_PINCTRL_NAME_TO_IDX(inst, name)`

Convert a pinctrl name to its corresponding index for a `DT_DRV_COMPAT` instance.

This is equivalent to [`DT\_PINCTRL\_NAME\_TO\_IDX\(DT\_DRV\_INST\(inst\), name\)`](#).

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores name of the pinctrl whose index to get

**Returns** integer literal for the index of the pinctrl property with that name

`DT_INST_PINCTRL_IDX_TO_NAME_TOKEN(inst, pc_idx)`

Convert a pinctrl index to its name as an uppercased token.

This is equivalent to [`DT\_PINCTRL\_IDX\_TO\_NAME\_TOKEN\(DT\_DRV\_INST\(inst\), pc\_idx\)`](#).

**Parameters**

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

**Returns** name of the pin control property as a token

`DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(inst, pc_idx)`

Convert a pinctrl index to its name as an uppercased token.

This is equivalent to [`DT\_PINCTRL\_IDX\_TO\_NAME\_UPPER\_TOKEN\(DT\_DRV\_INST\(inst\), idx\)`](#).

**Parameters**

- `inst` – instance number

- `pc_idx` – index of the pinctrl property itself

**Returns** name of the pin control property as an uppercase token

`DT_INST_NUM_PINCTRLS_BY_IDX(inst, pc_idx)`

Get the number of phandles in a pinctrl property for a `DT_DRV_COMPAT` instance.

This is equivalent to `DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst), pc_idx)`.

**Parameters**

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

**Returns** number of phandles in the property with that index

`DT_INST_NUM_PINCTRLS_BY_NAME(inst, name)`

Like `DT_INST_NUM_PINCTRLS_BY_IDX()`, but by name instead.

This is equivalent to `DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst), name)`.

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores name of the pinctrl property

**Returns** number of phandles in the property with that name

`DT_INST_NUM_PINCTRL_STATES(inst)`

Get the number of pinctrl properties in a `DT_DRV_COMPAT` instance.

This is equivalent to `DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst))`.

**Parameters**

- `inst` – instance number

**Returns** number of pinctrl properties in the instance

`DT_INST_PINCTRL_HAS_IDX(inst, pc_idx)`

Test if a `DT_DRV_COMPAT` instance has a pinctrl property with an index.

This is equivalent to `DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx)`.

**Parameters**

- `inst` – instance number
- `pc_idx` – index of a pinctrl property whose existence to check

**Returns** 1 if the property exists, 0 otherwise

`DT_INST_PINCTRL_HAS_NAME(inst, name)`

Test if a `DT_DRV_COMPAT` instance has a pinctrl property with a name.

This is equivalent to `DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name)`.

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores pinctrl property name to check

**Returns** 1 if the property exists, 0 otherwise

**PWM** These conveniences may be used for nodes which describe PWM controllers and properties related to them.

group devicetree-pwms

## Defines

`DT_PWMS_LABEL_BY_IDX(node_id, idx)`

Get a label property from a pwms property at an index.

It's an error if the PWM controller node referenced by the phandle in `node_id`'s pwms property at index “idx” has no label property.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    label = "PWM_1";
};

pwm2: pwm-controller@... {
    label = "PWM_2";
};

n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
          <&pwm2 3 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```
DT_PWMS_LABEL_BY_IDX(DT_NODELABEL(n), 0) // "PWM_1"
DT_PWMS_LABEL_BY_IDX(DT_NODELABEL(n), 1) // "PWM_2"
```

**See also:**

[\*DT\\_PROP\\_BY\\_PHANDLE\\_IDX\(\)\*](#)

### Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns** the label property of the node referenced at index “idx”

`DT_PWMS_LABEL_BY_NAME(node_id, name)`

Get a label property from a pwms property by name.

It's an error if the PWM controller node referenced by the phandle in `node_id`'s pwms property at the element named “name” has no label property.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    label = "PWM_1";
};

pwm2: pwm-controller@... {
    label = "PWM_2";
};

n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
          <&pwm2 3 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

Example usage:

```
DT_PWMS_LABEL_BY_NAME(DT_NODELABEL(n), alpha) // "PWM_1"
DT_PWMS_LABEL_BY_NAME(DT_NODELABEL(n), beta)  // "PWM_2"
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the label property of the node referenced at the named element

`DT_PWMS_LABEL(node_id)`

Equivalent to [\*DT\\_PWMS\\_LABEL\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_PWMS\\_LABEL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property

**Returns** the label property of the node referenced at index 0

`DT_PWMS_CTLR_BY_IDX(node_id, idx)`

Get the node identifier for the PWM controller from a pwms property at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };

n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
          <&pwm2 3 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)
```

**See also:**

[\*DT\\_PROP\\_BY\\_PHANDLE\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns** the node identifier for the PWM controller referenced at index “idx”

`DT_PWMS_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... { ... };
```

```
pwm2: pwm-controller... { ... };
```

```
n: node { pwms = <&pwm1 1 PWM_POLARITY_NORMAL>, <&pwm2 3  
PWM_POLARITY_INVERTED>; pwm-names = "alpha", "beta"; };
```

Example usage:

```
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)  
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), beta)  // DT_NODELABEL(pwm2)
```

**See also:**

[\*DT\\_PHANDLE\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's `pwm-names` property

**Returns** the node identifier for the PWM controller in the named element

`DT_PWMS_CTLR(node_id)`

Equivalent to [\*DT\\_PWMS\\_CTLR\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_PWMS\\_CTLR\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property

**Returns** the node identifier for the PWM controller at index 0 in the node's "pwms" property

`DT_PWMS_CELL_BY_IDX(node_id, idx, cell)`

Get PWM specifier's cell value at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... {  
    compatible = "vnd,pwm";  
    label = "PWM_1";  
    #pwm-cells = <2>;  
};
```

```
pwm2: pwm-controller@... {  
    compatible = "vnd,pwm";  
    label = "PWM_2";  
    #pwm-cells = <2>;  
};
```

```
n: node {
```

(continues on next page)

(continued from previous page)

```

        pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
               <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
};

```

Bindings fragment for the “vnd,pwm” compatible:

```

pwm-cells:
- channel
- period
- flags

```

Example usage:

```

DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period)  // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period)  // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags)    // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags)    // PWM_POLARITY_INVERTED

```

See also:

[DT\\_PHA\\_BY\\_IDX\(\)](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_PWMS_CELL_BY_NAME(node_id, name, cell)`

Get a PWM specifier’s cell value by name.

Example devicetree fragment:

```

pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    label = "PWM_1";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    label = "PWM_2";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};

```

Bindings fragment for the “vnd,pwm” compatible:

```
pwm-cells:
- channel
- period
- flags
```

Example usage:

```
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel)   // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period)   // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period)    // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags)    // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, flags)     // PWM_POLARITY_
↪ INVERTED
```

See also:

[\*DT\\_PHA\\_BY\\_NAME\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_PWMS_CELL(node_id, cell)`

Equivalent to [\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(node\\_id, 0, cell\)\*](#)

See also:

[\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index 0

`DT_PWMS_CHANNEL_BY_IDX(node_id, idx)`

Get a PWM specifier’s channel cell value at an index.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.

This is equivalent to [\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(node\\_id, idx, channel\)\*](#).

See also:

[\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(\)\*](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns** the channel cell value at index “idx”

`DT_PWMS_CHANNEL_BY_NAME(node_id, name)`

Get a PWM specifier’s channel cell value by name.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_NAME(node_id, name, channel)`.

**See also:**

[`DT\_PWMS\_CELL\_BY\_NAME\(\)`](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the channel cell value in the specifier at the named element

`DT_PWMS_CHANNEL(node_id)`

Equivalent to `DT_PWMS_CHANNEL_BY_IDX(node_id, 0)`

**See also:**

[`DT\_PWMS\_CHANNEL\_BY\_IDX\(\)`](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property

**Returns** the channel cell value at index 0

`DT_PWMS_PERIOD_BY_IDX(node_id, idx)`

Get PWM specifier’s period cell value at an index.

This macro only works for PWM specifiers with cells named “period”. Refer to the node’s binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_IDX(node_id, idx, period)`.

**See also:**

[`DT\_PWMS\_CELL\_BY\_IDX\(\)`](#)

#### Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns** the period cell value at index “idx”

`DT_PWMS_PERIOD_BY_NAME(node_id, name)`

Get a PWM specifier’s period cell value by name.

This macro only works for PWM specifiers with cells named “period”. Refer to the node’s binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_NAME(node_id, name, period)`.

**See also:**

[\*DT\\_PWMS\\_CELL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the period cell value in the specifier at the named element

`DT_PWMS_PERIOD(node_id)`

Equivalent to [\*DT\\_PWMS\\_PERIOD\\_BY\\_IDX\(node\\_id, 0\)\*](#)

**See also:**

[\*DT\\_PWMS\\_PERIOD\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a pwms property

**Returns** the period cell value at index 0

`DT_PWMS_FLAGS_BY_IDX(node_id, idx)`

Get a PWM specifier’s flags cell value at an index.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the PWM specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

This is equivalent to [\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(node\\_id, idx, flags\)\*](#).

**See also:**

[\*DT\\_PWMS\\_CELL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns** the flags cell value at index “idx”, or zero if there is none

`DT_PWMS_FLAGS_BY_NAME(node_id, name)`

Get a PWM specifier’s flags cell value by name.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the PWM specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

This is equivalent to [\*DT\\_PWMS\\_CELL\\_BY\\_NAME\(node\\_id, name, flags\)\*](#) if there is a flags cell, but expands to zero if there is none.

**See also:**

[\*DT\\_PWMS\\_CELL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's `pwm-names` property

**Returns** the flags cell value in the specifier at the named element, or zero if there is none

`DT_PWMS_FLAGS(node_id)`

Equivalent to [`DT\_PWMS\_FLAGS\_BY\_IDX\(node\_id, 0\)`](#)

**See also:**

[`DT\_PWMS\_FLAGS\_BY\_IDX\(\)`](#)

**Parameters**

- `node_id` – node identifier for a node with a pwms property

**Returns** the flags cell value at index 0, or zero if there is none

`DT_INST_PWMS_LABEL_BY_IDX(inst, idx)`

Get a label property from a `DT_DRV_COMPAT` instance's pwms property by name.

**See also:**

[`DT\_PWMS\_LABEL\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into pwms property

**Returns** the label property of the node referenced at index “idx”

`DT_INST_PWMS_LABEL_BY_NAME(inst, name)`

Get a label property from a `DT_DRV_COMPAT` instance's pwms property by name.

**See also:**

[`DT\_PWMS\_LABEL\_BY\_NAME\(\)`](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's `pwm-names` property

**Returns** the label property of the node referenced at the named element

`DT_INST_PWMS_LABEL(inst)`

Equivalent to [`DT\_INST\_PWMS\_LABEL\_BY\_IDX\(inst, 0\)`](#)

**See also:**

[`DT\_PWMS\_LABEL\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number

**Returns** the label property of the node referenced at index 0

`DT_INST_PWMS_CTLR_BY_IDX(inst, idx)`

Get the node identifier for the PWM controller from a DT\_DRV\_COMPAT instance's pwms property at an index.

**See also:**

[\*DT\\_PWMS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into pwms property

**Returns** the node identifier for the PWM controller referenced at index “idx”

`DT_INST_PWMS_CTLR_BY_NAME(inst, name)`

Get the node identifier for the PWM controller from a DT\_DRV\_COMPAT instance's pwms property by name.

**See also:**

[\*DT\\_PWMS\\_CTLR\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

**Returns** the node identifier for the PWM controller in the named element

`DT_INST_PWMS_CTLR(inst)`

Equivalent to [\*DT\\_INST\\_PWMS\\_CTLR\\_BY\\_IDX\(inst, 0\)\*](#)

**See also:**

[\*DT\\_PWMS\\_CTLR\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number

**Returns** the node identifier for the PWM controller at index 0 in the instance's “pwms” property

`DT_INST_PWMS_CELL_BY_IDX(inst, idx, cell)`

Get a DT\_DRV\_COMPAT instance's PWM specifier's cell value at an index.

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into pwms property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index “idx”

`DT_INST_PWMS_CELL_BY_NAME(inst, name, cell)`

Get a `DT_DRV_COMPAT` instance’s PWM specifier’s cell value by name.

**See also:**

[\*DT\\_PWMS\\_CELL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value in the specifier at the named element

`DT_INST_PWMS_CELL(inst, cell)`

Equivalent to [\*DT\\_INST\\_PWMS\\_CELL\\_BY\\_IDX\(inst, 0, cell\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `cell` – lowercase-and-underscores cell name

**Returns** the cell value at index 0

`DT_INST_PWMS_CHANNEL_BY_IDX(inst, idx)`

Equivalent to [\*DT\\_INST\\_PWMS\\_CELL\\_BY\\_IDX\(inst, idx, channel\)\*](#)

**See also:**

[\*DT\\_INST\\_PWMS\\_CELL\\_BY\\_IDX\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `idx` – logical index into pwms property

**Returns** the channel cell value at index “idx”

`DT_INST_PWMS_CHANNEL_BY_NAME(inst, name)`

Equivalent to [\*DT\\_INST\\_PWMS\\_CELL\\_BY\\_NAME\(inst, name, channel\)\*](#)

**See also:**

[\*DT\\_INST\\_PWMS\\_CELL\\_BY\\_NAME\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the channel cell value in the specifier at the named element

`DT_INST_PWMS_CHANNEL(inst)`

Equivalent to `DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)`

**See also:**

`DT_INST_PWMS_CHANNEL_BY_IDX()`

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number

**Returns** the channel cell value at index 0

`DT_INST_PWMS_PERIOD_BY_IDX(inst, idx)`

Equivalent to `DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)`

**See also:**

`DT_INST_PWMS_CELL_BY_IDX()`

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into pwms property

**Returns** the period cell value at index “idx”

`DT_INST_PWMS_PERIOD_BY_NAME(inst, name)`

Equivalent to `DT_INST_PWMS_CELL_BY_NAME(inst, name, period)`

**See also:**

`DT_INST_PWMS_CELL_BY_NAME()`

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the period cell value in the specifier at the named element

`DT_INST_PWMS_PERIOD(inst)`

Equivalent to `DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)`

**See also:**

`DT_INST_PWMS_PERIOD_BY_IDX()`

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number

**Returns** the period cell value at index 0

`DT_INST_PWMS_FLAGS_BY_IDX(inst, idx)`

Equivalent to [`DT\_INST\_PWMS\_CELL\_BY\_IDX\(inst, idx, flags\)`](#)

**See also:**

[`DT\_INST\_PWMS\_CELL\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `idx` – logical index into pwms property

**Returns** the flags cell value at index “idx”, or zero if there is none

`DT_INST_PWMS_FLAGS_BY_NAME(inst, name)`

Equivalent to [`DT\_INST\_PWMS\_CELL\_BY\_NAME\(inst, name, flags\)`](#)

**See also:**

[`DT\_INST\_PWMS\_CELL\_BY\_NAME\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s `pwm-names` property

**Returns** the flags cell value in the specifier at the named element, or zero if there is none

`DT_INST_PWMS_FLAGS(inst)`

Equivalent to [`DT\_INST\_PWMS\_FLAGS\_BY\_IDX\(inst, 0\)`](#)

**See also:**

[`DT\_INST\_PWMS\_FLAGS\_BY\_IDX\(\)`](#)

**Parameters**

- `inst` – DT\_DRV\_COMPAT instance number

**Returns** the flags cell value at index 0, or zero if there is none

**SPI** These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

*group* `devicetree-spi`

## Defines

`DT_SPI_HAS_CS_GPIOS(spi)`

Does a SPI controller node have chip select GPIOs configured?

SPI bus controllers use the “`cs-gpios`” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};

spi2: spi@... {
    compatible = "vnd,spi";
};
```

Example usage:

```
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

### Parameters

- spi – a SPI bus controller node identifier

**Returns** 1 if “spi” has a cs-gpios property, 0 otherwise

DT\_SPI\_NUM\_CS\_GPIOS(spi)

Number of chip select GPIOs in a SPI controller’s cs-gpios property.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};

spi2: spi@... {
    compatible = "vnd,spi";
};
```

Example usage:

```
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

### Parameters

- spi – a SPI bus controller node identifier

**Returns** Logical length of spi’s cs-gpios property, or 0 if “spi” doesn’t have a cs-gpios property

DT\_SPI\_DEV\_HAS\_CS\_GPIOS(spi\_dev)

Does a SPI device have a chip select line configured? Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
```

(continues on next page)

(continued from previous page)

```

        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

spi2: spi@... {
    compatible = "vnd,spi";
    c: spi-dev-c@0 {
        reg = <0>;
    };
};

```

Example usage:

```

DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0

```

### Parameters

- `spi_dev` – a SPI device node identifier

**Returns** 1 if `spi_dev`'s bus node [DT\\_BUS\(`spi\_dev`\)](#) has a chip select pin at index [DT\\_REG\\_ADDR\(`spi\_dev`\)](#), 0 otherwise

`DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)`

Get a SPI device's chip select GPIO controller's node identifier.

Example devicetree fragment:

```

gpio1: gpio@... { ... };

gpio2: gpio@... { ... };

spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

```

Example usage:

```

DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)

```

### Parameters

- `spi_dev` – a SPI device node identifier

**Returns** node identifier for spi\_dev's chip select GPIO controller

DT\_SPI\_DEV\_CS\_GPIOS\_LABEL(spi\_dev)

Get a SPI device's chip select GPIO controller's label property.

Example devicetree fragment:

```
gpio1: gpio@... {
    label = "GPIO_1";
};

gpio2: gpio@... {
    label = "GPIO_2";
};

spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_LABEL(DT_Nodelabel(a)) // "GPIO_1"
DT_SPI_DEV_CS_GPIOS_LABEL(DT_Nodelabel(b)) // "GPIO_2"
```

### Parameters

- spi\_dev – a SPI device node identifier

**Returns** label property of spi\_dev's chip select GPIO controller

DT\_SPI\_DEV\_CS\_GPIOS\_PIN(spi\_dev)

Get a SPI device's chip select GPIO pin number.

It's an error if the GPIO specifier for spi\_dev's entry in its bus node's cs-gpios property has no pin cell.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```

(continues on next page)

(continued from previous page)

```
};
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODLABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODLABEL(b)) // 20
```

### Parameters

- `spi_dev` – a SPI device node identifier

**Returns** pin number of `spi_dev`'s chip select GPIO

`DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)`

Get a SPI device's chip select GPIO flags.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_NODLABEL(a)) // GPIO_ACTIVE_LOW
```

If the GPIO specifier for `spi_dev`'s entry in its bus node's `cs-gpios` property has no flags cell, this expands to zero.

### Parameters

- `spi_dev` – a SPI device node identifier

**Returns** flags value of `spi_dev`'s chip select GPIO specifier, or zero if there is none

`DT_INST_SPI_DEV_HAS_CS_GPIOS(inst)`

Equivalent to [DT\\_SPI\\_DEV\\_HAS\\_CS\\_GPIOS\(DT\\_DRV\\_INST\(inst\)\)](#).

**See also:**

[DT\\_SPI\\_DEV\\_HAS\\_CS\\_GPIOS\(\)](#)

### Parameters

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** 1 if the instance's bus has a CS pin at index [DT\\_INST\\_REG\\_ADDR\(inst\)](#), 0 otherwise

`DT_INST_SPI_DEV_CS_GPIOS_CTLR(inst)`

Get GPIO controller node identifier for a SPI device instance This is equivalent to [DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_CTLR\(DT\\_DRV\\_INST\(inst\)\)](#).

See also:

[\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_CTLR\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** node identifier for instance's chip select GPIO controller

`DT_INST_SPI_DEV_CS_GPIOS_LABEL(inst)`

Get GPIO controller name for a SPI device instance. This is equivalent to [\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_LABEL\(DT\\_DRV\\_INST\(inst\)\)\*](#).

See also:

[\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_LABEL\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** label property of the instance's chip select GPIO controller

`DT_INST_SPI_DEV_CS_GPIOS_PIN(inst)`

Equivalent to [\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_PIN\(DT\\_DRV\\_INST\(inst\)\)\*](#).

See also:

[\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_PIN\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** pin number of the instance's chip select GPIO

`DT_INST_SPI_DEV_CS_GPIOS_FLAGS(inst)`

[\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_FLAGS\(DT\\_DRV\\_INST\(inst\)\)\*](#).

See also:

[\*DT\\_SPI\\_DEV\\_CS\\_GPIOS\\_FLAGS\(\)\*](#)

**Parameters**

- `inst` – `DT_DRV_COMPAT` instance number

**Returns** flags value of the instance's chip select GPIO specifier, or zero if there is none

## Chosen nodes

The special `/chosen` node contains properties whose values describe system-wide settings. The [\*DT\\_CHOSEN\(\)\*](#) macro can be used to get a node identifier for a chosen node.

`group devicetree-generic-chosen`

## Defines

`DT_CHOSEN(prop)`

Get a node identifier for a /chosen node property.

This is only valid to call if `DT_HAS_CHOSEN(prop)` is 1.

### Parameters

- `prop` – lowercase-and-underscores property name for the /chosen node

**Returns** a node identifier for the chosen node property

`DT_HAS_CHOSEN(prop)`

Test if the devicetree has a /chosen node.

### Parameters

- `prop` – lowercase-and-underscores devicetree property

**Returns** 1 if the chosen property exists and refers to a node, 0 otherwise

There are also conveniences for commonly used zephyr-specific properties of the /chosen node.

*group* devicetree-zephyr

## Defines

`DT_CHOSEN_ZEPHYR_ENTROPY_LABEL`

If there is a chosen node `zephyr,entropy` property which has a `label` property, that property's value. Undefined otherwise.

`DT_CHOSEN_ZEPHYR_FLASH_CONTROLLER_LABEL`

If there is a chosen node `zephyr,flash-controller` property which has a `label` property, that property's value. Undefined otherwise.

`DT_CHOSEN_ZEPHYR_CAN_PRIMARY_LABEL`

If there is a chosen node `zephyr,can-primary` property which has a `label` property, that property's value. Undefined otherwise.

The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node's `label` property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.

Table 4: Zephyr-specific chosen properties

Property	Purpose
zephyr,bt-c2h-uart	Selects the UART used for host communication in the bluetooth-hci-uart-sample
zephyr,bt-mon-uart	Sets UART device used for the Bluetooth monitor logging
zephyr,bt-uart	Sets UART device used by Bluetooth
zephyr,can-primary	Sets the primary CAN controller
zephyr,ccm	Core-Coupled Memory node on some STM32 SoCs
zephyr,code-partition	Flash partition that the Zephyr image's text section should be linked into
zephyr,console	Sets UART device used by console driver
zephyr,dtcm	Data Tightly Coupled Memory node on some Arm SoCs
zephyr,entropy	A device which can be used as a system-wide entropy source
zephyr,flash	A node whose <code>reg</code> is sometimes used to set the defaults for <code>:kconfig: `CONFIG_FLASH_BASE_ADDRESS`</code> and <code>:kconfig: `CONFIG_FLASH_SIZE`</code>
zephyr,flash-controller	The node corresponding to the flash controller device for the <code>zephyr,flash</code> node
zephyr,ipc	Used by the OpenAMP subsystem to specify the inter-process communication (IPC) device
zephyr,ipc_shm	A node whose <code>reg</code> is used by the OpenAMP subsystem to determine the base address and size of the shared memory (SHM) usable for interprocess-communication (IPC)
zephyr,itcm	Instruction Tightly Coupled Memory node on some Arm SoCs
zephyr,ot-uart	Used by the OpenThread to specify UART device for Spinel protocol
zephyr,shell-uart	Sets UART device used by serial shell backend
zephyr,sram	A node whose <code>reg</code> sets the base address and size of SRAM memory available to the Zephyr image, used during linking
zephyr,uart-mcumgr	UART used for <a href="#">Device Management</a>
zephyr,uart-pipe	Sets default <code>:kconfig: `CONFIG_UART_PIPE_ON_DEV_NAME`</code>
zephyr,usb-device	USB device node. If defined and has a <code>vbus-gpios</code> property, these will be used by the USB subsystem to enable/disable VBUS

## 7.6.2 Bindings index

This page documents the available devicetree bindings. See [Devicetree bindings](#) for an introduction to the Zephyr bindings file format.

### Vendor index

This section contains an index of hardware vendors. Click on a vendor's name to go to the list of bindings for that vendor.

### Bindings by vendor

This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the “compatible” property they apply to, like this:

#### Vendor name (vendor prefix)

- <compatible-A>
- <compatible-B> (on <bus-name> bus)
- <compatible-C>
- ...

The text “(on <bus-name> bus)” appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

## 7.7 Device Driver Model

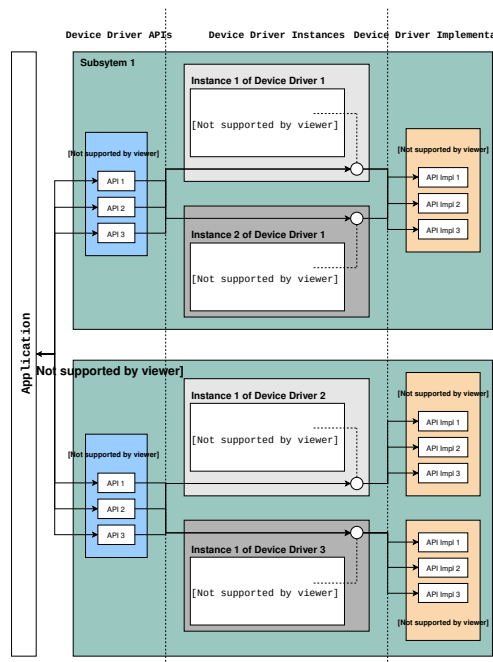

### 7.7.1 Introduction

The Zephyr kernel supports a variety of device drivers. Whether a driver is available depends on the board and the driver.

The Zephyr device model provides a consistent device model for configuring the drivers that are part of a system. The device model is responsible for initializing all the drivers configured into the system.

Each type of driver (e.g. UART, SPI, I2C) is supported by a generic type API.

In this model the driver fills in the pointer to the structure containing the function pointers to its API functions during driver initialization. These structures are placed into the RAM section in initialization level order.

## 7.7.2 Standard Drivers

Device drivers which are present on all supported board configurations are listed below.

- **Interrupt controller:** This device driver is used by the kernel's interrupt management subsystem.
- **Timer:** This device driver is used by the kernel's system clock and hardware clock subsystem.
- **Serial communication:** This device driver is used by the kernel's system console subsystem.
- **Entropy:** This device driver provides a source of entropy numbers for the random number generator subsystem.

---

**Important:** Use the [random API functions](#) for random values. [Entropy functions](#) should not be directly used as a random number generator source as some hardware implementations are designed to be an entropy seed source for random number generators and will not provide cryptographically secure random number streams.

---

## 7.7.3 Synchronous Calls

Zephyr provides a set of device drivers for multiple boards. Each driver should support an interrupt-based implementation, rather than polling, unless the specific hardware does not provide any interrupt.

High-level calls accessed through device-specific APIs, such as `i2c.h` or `spi.h`, are usually intended as synchronous. Thus, these calls should be blocking.

## 7.7.4 Driver APIs

The following APIs for device drivers are provided by `device.h`. The APIs are intended for use in device drivers only and should not be used in applications.

`DEVICE_DEFINE()` Create device object and related data structures including setting it up for boot-time initialization.

`DEVICE_NAME_GET()` Converts a device identifier to the global identifier for a device object.

`DEVICE_GET()` Obtain a pointer to a device object by name.

`DEVICE_DECLARE()` Declare a device object. Use this when you need a forward reference to a device that has not yet been defined.

### 7.7.5 Driver Data Structures

The device initialization macros populate some data structures at build time which are split into read-only and runtime-mutable parts. At a high level we have:

```
struct device {
    const char *name;
    const void *config;
    const void *api;
    void * const data;
};
```

The config member is for read-only configuration data set at build time. For example, base memory mapped IO addresses, IRQ line numbers, or other fixed physical characteristics of the device. This is the config pointer passed to `DEVICE_DEFINE()` and related macros.

The data struct is kept in RAM, and is used by the driver for per-instance runtime housekeeping. For example, it may contain reference counts, semaphores, scratch buffers, etc.

The api struct maps generic subsystem APIs to the device-specific implementations in the driver. It is typically read-only and populated at build time. The next section describes this in more detail.

### 7.7.6 Subsystems and API Structures

Most drivers will be implementing a device-independent subsystem API. Applications can simply program to that generic API, and application code is not specific to any particular driver implementation.

A subsystem API definition typically looks like this:

```
typedef int (*subsystem_do_this_t)(const struct device *dev, int foo, int bar);
typedef void (*subsystem_do_that_t)(const struct device *dev, void *baz);

struct subsystem_api {
    subsystem_do_this_t do_this;
    subsystem_do_that_t do_that;
};

static inline int subsystem_do_this(const struct device *dev, int foo, int bar)
{
    struct subsystem_api *api;

    api = (struct subsystem_api *)dev->api;
    return api->do_this(dev, foo, bar);
}

static inline void subsystem_do_that(const struct device *dev, void *baz)
{
    struct subsystem_api *api;
```

(continues on next page)

(continued from previous page)

```
    api = (struct subsystem_api *)dev->api;
    api->do_that(dev, baz);
}
```

A driver implementing a particular subsystem will define the real implementation of these APIs, and populate an instance of `subsystem_api` structure:

```
static int my_driver_do_this(const struct device *dev, int foo, int bar)
{
    ...
}

static void my_driver_do_that(const struct device *dev, void *baz)
{
    ...
}

static struct subsystem_api my_driver_api_funcs = {
    .do_this = my_driver_do_this,
    .do_that = my_driver_do_that
};
```

The driver would then pass `my_driver_api_funcs` as the `api` argument to `DEVICE_DEFINE()`.

---

**Note:** Since pointers to the API functions are referenced in the `api` struct, they will always be included in the binary even if unused; `gc-sections` linker option will always see at least one reference to them. Providing for link-time size optimizations with driver APIs in most cases requires that the optional feature be controlled by a Kconfig option.

---

### 7.7.7 Device-Specific API Extensions

Some devices can be cast as an instance of a driver subsystem such as GPIO, but provide additional functionality that cannot be exposed through the standard API. These devices combine subsystem operations with device-specific APIs, described in a device-specific header.

A device-specific API definition typically looks like this:

```
#include <drivers/subsystem.h>

/* When extensions need not be invoked from user mode threads */
int specific_do_that(const struct device *dev, int foo);

/* When extensions must be invocable from user mode threads */
__syscall int specific_from_user(const struct device *dev, int bar);

/* Only needed when extensions include syscalls */
#include <syscalls/specific.h>
```

A driver implementing extensions to the subsystem will define the real implementation of both the subsystem API and the specific APIs:

```
static int generic_do_this(const struct device *dev, void *arg)
{
    ...
}
```

(continues on next page)

(continued from previous page)

```

static struct generic_api api {
    ...
    .do_this = generic_do_this,
    ...
};

/* supervisor-only API is globally visible */
int specific_do_that(const struct device *dev, int foo)
{
    ...
}

/* syscall API passes through a translation */
int z_impl_specific_from_user(const struct device *dev, int bar)
{
    ...
}

#ifdef CONFIG_USERSPACE

#include <syscall_handler.h>

int z_vrfy_specific_from_user(const struct device *dev, int bar)
{
    Z_OOPS(Z_SYSCALL_SPECIFIC_DRIVER(dev, K_OBJ_DRIVER_GENERIC, &api));
    return z_impl_specific_do_that(dev, bar)
}

#include <syscalls/specific_from_user_mrsh.c>

#endif /* CONFIG_USERSPACE */

```

Applications use the device through both the subsystem and specific APIs.

---

**Note:** Public API for device-specific extensions should be prefixed with the compatible for the device to which it applies. For example, if adding special functions to support the Maxim DS3231 the identifier fragment specific in the examples above would be `maxim_ds3231`.

---

### 7.7.8 Single Driver, Multiple Instances

Some drivers may be instantiated multiple times in a given system. For example there can be multiple GPIO banks, or multiple UARTS. Each instance of the driver will have a different config struct and data struct.

Configuring interrupts for multiple drivers instances is a special case. If each instance needs to configure a different interrupt line, this can be accomplished through the use of per-instance configuration functions, since the parameters to `IRQ_CONNECT()` need to be resolvable at build time.

For example, let's say we need to configure two instances of `my_driver`, each with a different interrupt line. In `drivers/subsystem/subsystem_my_driver.h`:

```

typedef void (*my_driver_config_irq_t)(const struct device *dev);

struct my_driver_config {

```

(continues on next page)

(continued from previous page)

```
    DEVICE_MMIO_ROM;
    my_driver_config_irq_t config_func;
};
```

In the implementation of the common init function:

```
void my_driver_isr(const struct device *dev)
{
    /* Handle interrupt */
    ...
}

int my_driver_init(const struct device *dev)
{
    const struct my_driver_config *config = dev->config;

    DEVICE_MMIO_MAP(dev, K_MEM_CACHE_NONE);

    /* Do other initialization stuff */
    ...

    config->config_func(dev);

    return 0;
}
```

Then when the particular instance is declared:

```
#if CONFIG_MY_DRIVER_0

DEVICE_DECLARE(my_driver_0);

static void my_driver_config_irq_0(void)
{
    IRQ_CONNECT(MY_DRIVER_0_IRQ, MY_DRIVER_0_PRI, my_driver_isr,
                DEVICE_GET(my_driver_0), MY_DRIVER_0_FLAGS);
}

const static struct my_driver_config my_driver_config_0 = {
    DEVICE_MMIO_ROM_INIT(DT_DRV_INST(0)),
    .config_func = my_driver_config_irq_0
}

static struct my_data_0;

DEVICE_DEFINE(my_driver_0, MY_DRIVER_0_NAME, my_driver_init,
              NULL, &my_data_0, &my_driver_config_0,
              POST_KERNEL, MY_DRIVER_0_PRIORITY, &my_api_funcs);

#endif /* CONFIG_MY_DRIVER_0 */
```

Note the use of `DEVICE_DECLARE()` to avoid a circular dependency on providing the IRQ handler argument and the definition of the device itself.

### 7.7.9 Initialization Levels

Drivers may depend on other drivers being initialized first, or require the use of kernel services. `DEVICE_DEFINE()` and related APIs allow the user to specify at what time during the boot sequence the init function will be executed. Any driver will specify one of four initialization levels:

`PRE_KERNEL_1` Used for devices that have no dependencies, such as those that rely solely on hardware present in the processor/SOC. These devices cannot use any kernel services during configuration, since the kernel services are not yet available. The interrupt subsystem will be configured however so it's OK to set up interrupts. Init functions at this level run on the interrupt stack.

`PRE_KERNEL_2` Used for devices that rely on the initialization of devices initialized as part of the `PRE_KERNEL_1` level. These devices cannot use any kernel services during configuration, since the kernel services are not yet available. Init functions at this level run on the interrupt stack.

`POST_KERNEL` Used for devices that require kernel services during configuration. Init functions at this level run in context of the kernel main task.

`APPLICATION` Used for application components (i.e. non-kernel components) that need automatic configuration. These devices can use all services provided by the kernel during configuration. Init functions at this level run on the kernel main task.

Within each initialization level you may specify a priority level, relative to other devices in the same initialization level. The priority level is specified as an integer value in the range 0 to 99; lower values indicate earlier initialization. The priority level must be a decimal integer literal without leading zeroes or sign (e.g. 32), or an equivalent symbolic name (e.g. `\#define MY_INIT_PRIORITY 32`); symbolic expressions are *not* permitted (e.g. `CONFIG_KERNEL_INIT_PRIORITY_DEFAULT + 5`).

Drivers and other system utilities can determine whether startup is still in pre-kernel states by using the `k_is_pre_kernel()` function.

### 7.7.10 System Drivers

In some cases you may just need to run a function at boot. Special `SYS_*` macros exist that map to `DEVICE_DEFINE()` calls. For `SYS_INIT()` there are no config or runtime data structures and there isn't a way to later get a device pointer by name. The same policies for initialization level and priority apply.

For `SYS_DEVICE_DEFINE()` you can obtain pointers by name, see [power management](#) section.

`SYS_INIT()` Run an initialization function at boot at specified priority.

`SYS_DEVICE_DEFINE()` Like `DEVICE_DEFINE()` without an API table and constructing the device name from the init function name.

### 7.7.11 Error handling

In general, it's best to use `__ASSERT()` macros instead of propagating return values unless the failure is expected to occur during the normal course of operation (such as a storage device full). Bad parameters, programming errors, consistency checks, pathological/unrecoverable failures, etc., should be handled by assertions.

When it is appropriate to return error conditions for the caller to check, 0 should be returned on success and a POSIX `errno.h` code returned on failure. See <https://github.com/zephyrproject-rtos/zephyr/wiki/Naming-Conventions#return-codes> for details about this.

### 7.7.12 Memory Mapping

On some systems, the linear address of peripheral memory-mapped I/O (MMIO) regions cannot be known at build time:

- The I/O ranges must be probed at runtime from the bus, such as with PCI express
- A memory management unit (MMU) is active, and the physical address of the MMIO range must be mapped into the page tables at some virtual memory location determined by the kernel.

These systems must maintain storage for the MMIO range within RAM and establish the mapping within the driver's init function. Other systems do not care about this and can use MMIO physical addresses directly from DTS and do not need any RAM-based storage for it.

For drivers that may need to deal with this situation, a set of APIs under the `DEVICE_MMIO` scope are defined, along with a mapping function `device_map()`.

### Device Model Drivers with one MMIO region

The simplest case is for drivers which need to maintain one MMIO region. These drivers will need to use the `DEVICE_MMIO_ROM` and `DEVICE_MMIO_RAM` macros in the definitions for their `config_info` and `driver_data` structures, with initialization of the `config_info` from DTS using `DEVICE_MMIO_ROM_INIT`. A call to `DEVICE_MMIO_MAP()` is made within the init function:

```
struct my_driver_config {
    DEVICE_MMIO_ROM; /* Must be first */
    ...
}

struct my_driver_dev_data {
    DEVICE_MMIO_RAM; /* Must be first */
    ...
}

const static struct my_driver_config my_driver_config_0 = {
    DEVICE_MMIO_ROM_INIT(DT_DRV_INST(...)),
    ...
}

int my_driver_init(const struct device *dev)
{
    ...
    DEVICE_MMIO_MAP(dev, K_MEM_CACHE_NONE);
    ...
}

int my_driver_some_function(const struct device *dev)
{
    ...
    /* Write some data to the MMIO region */
    sys_write32(0xDEADBEEF, DEVICE_MMIO_GET(dev));
    ...
}
```

The particular expansion of these macros depends on configuration. On a device with no MMU or PCI-e, `DEVICE_MMIO_MAP` and `DEVICE_MMIO_RAM` expand to nothing.

### Device Model Drivers with multiple MMIO regions

Some drivers may have multiple MMIO regions. In addition, some drivers may already be implementing a form of inheritance which requires some other data to be placed first in the `config_info` and `driver_data` structures.

This can be managed with the `DEVICE_MMIO_NAMED` variant macros. These require that `DEV_CFG()` and `DEV_DATA()` macros be defined to obtain a properly typed pointer to the driver's `config_info` or `dev_data` structs. For example:

```
struct my_driver_config {
    ...
    DEVICE_MMIO_NAMED_ROM(corge);
    DEVICE_MMIO_NAMED_ROM(grault);
    ...
}

struct my_driver_dev_data {
    ...
    DEVICE_MMIO_NAMED_RAM(corge);
    DEVICE_MMIO_NAMED_RAM(grault);
    ...
}

#define DEV_CFG(_dev) \
    ((const struct my_driver_config *)((_dev)->config))

#define DEV_DATA(_dev) \
    ((struct my_driver_dev_data *)((_dev)->data))

const static struct my_driver_config my_driver_config_0 = {
    ...
    DEVICE_MMIO_NAMED_ROM_INIT(corge, DT_DRV_INST(...)),
    DEVICE_MMIO_NAMED_ROM_INIT(grault, DT_DRV_INST(...)),
    ...
}

int my_driver_init(const struct device *dev)
{
    ...
    DEVICE_MMIO_NAMED_MAP(dev, corge, K_MEM_CACHE_NONE);
    DEVICE_MMIO_NAMED_MAP(dev, grault, K_MEM_CACHE_NONE);
    ...
}

int my_driver_some_function(const struct device *dev)
{
    ...
    /* Write some data to the MMIO regions */
    sys_write32(0xDEADBEEF, DEVICE_MMIO_GET(dev, grault));
    sys_write32(0xF0CCAC1A, DEVICE_MMIO_GET(dev, corge));
    ...
}
```

### Drivers that do not use Zephyr Device Model

Some drivers or driver-like code may not use Zephyr's device model, and alternative storage must be arranged for the MMIO data. An example of this are timer drivers, or interrupt controller code.

This can be managed with the `DEVICE_MMIO_TOPLEVEL` set of macros, for example:

```
DEVICE_MMIO_TOPLEVEL_STATIC(my_regs, DT_DRV_INST(...));
```

(continues on next page)

(continued from previous page)

```
void some_init_code(...)
{
    ...
    DEVICE_MMIO_TOPLEVEL_MAP(my_regs, K_MEM_CACHE_NONE);
    ...
}

void some_function(...)
{
    ...
    sys_write32(DEVICE_MMIO_TOPLEVEL_GET(my_regs), 0xDEADBEEF);
    ...
}
```

### Drivers that do not use DTS

Some drivers may not obtain the MMIO physical address from DTS, such as is the case with PCI-E. In this case the `device_map()` function may be used directly:

```
void some_init_code(...)
{
    ...
    struct pcie_mbar mbar;
    bool bar_found = pcie_get_mbar(bdf, index, &mbar);

    device_map(DEVICE_MMIO_RAM_PTR(dev), mbar.phys_addr, mbar.size, K_MEM_CACHE_NONE);
    ...
}
```

For these cases, `DEVICE_MMIO_ROM` directives may be omitted.

## 7.7.13 API Reference

*group* device\_model

Device Model APIs.

### Defines

`DEVICE_HANDLE_SEP`

Flag value used in lists of device handles to separate distinct groups.

This is the minimum value for the `device_handle_t` type.

`DEVICE_HANDLE_ENDS`

Flag value used in lists of device handles to indicate the end of the list.

This is the maximum value for the `device_handle_t` type.

`DEVICE_HANDLE_NULL`

Flag value used to identify an unknown device.

`DEVICE_NAME_GET(name)`

Expands to the full name of a global device object.

Return the full name of a device object symbol created by [DEVICE\\_DEFINE\(\)](#), using the `dev_name` provided to [DEVICE\\_DEFINE\(\)](#).

It is meant to be used for declaring extern symbols pointing on device objects before using the `DEVICE_GET` macro to get the device object.

#### Parameters

- `name` – The same as `dev_name` provided to [DEVICE\\_DEFINE\(\)](#)

**Returns** The expanded name of the device object created by [DEVICE\\_DEFINE\(\)](#)

`SYS_DEVICE_DEFINE(drv_name, init_fn, pm_control_fn, level, prio)`

Run an initialization function at boot at specified priority, and define device PM control function.

Invokes [DEVICE\\_DEFINE\(\)](#) with no power management support (`pm_control_fn`), no API (`api_ptr`), and a device name derived from the `init_fn` name (`dev_name`).

`DEVICE_DEFINE(dev_name, drv_name, init_fn, pm_control_fn, data_ptr, cfg_ptr, level, prio, api_ptr)`

Create device object and set it up for boot time initialization, with the option to `pm_control`. In case of Device Idle Power Management is enabled, make sure the device is in suspended state after initialization.

This macro defines a device object that is automatically configured by the kernel during system initialization. Note that devices set up with this macro will not be accessible from user mode since the API is not specified;

#### Parameters

- `dev_name` – Device name. This must be less than `Z_DEVICE_MAX_NAME_LEN` characters (including terminating NUL) in order to be looked up from user mode with [device\\_get\\_binding\(\)](#).
- `drv_name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm_control_fn` – Pointer to `pm_control` function. Can be NULL if not implemented.
- `data_ptr` – Pointer to the device's private data.
- `cfg_ptr` – The address to the structure containing the configuration information for this instance of the driver.
- `level` – The initialization level. See [SYS\\_INIT\(\)](#) for details.
- `prio` – Priority within the selected initialization level. See [SYS\\_INIT\(\)](#) for details.
- `api_ptr` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

`DEVICE_DT_NAME(node_id)`

Return a string name for a devicetree node.

This macro returns a string literal usable as a device name from a devicetree node. If the node has a “label” property, its value is returned. Otherwise, the node's full “node-name@@unit-address” name is returned.

#### Parameters

- `node_id` – The devicetree node identifier.

`DEVICE_DT_DEFINE(node_id, init_fn, pm_control_fn, data_ptr, cfg_ptr, level, prio, api_ptr, ...)`

Like `DEVICE_DEFINE` but taking metadata from a devicetree node.

This macro defines a device object that is automatically configured by the kernel during system initialization. The device object name is derived from the node identifier (encoding the devicetree path to the node), and the driver name is from the `label` property of the devicetree node.

The device is declared with extern visibility, so device objects defined through this API can be obtained directly through `DEVICE_DT_GET()` using `node_id`. Before using the pointer the referenced object should be checked using `device_is_ready()`.

#### Parameters

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm_control_fn` – Pointer to `pm_control` function. Can be NULL if not implemented.
- `data_ptr` – Pointer to the device's private data.
- `cfg_ptr` – The address to the structure containing the configuration information for this instance of the driver.
- `level` – The initialization level. See `SYS_INIT()` for details.
- `prio` – Priority within the selected initialization level. See `SYS_INIT()` for details.
- `api_ptr` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

`DEVICE_DT_INST_DEFINE(inst, ...)`

Like `DEVICE_DT_DEFINE` for an instance of a `DT_DRV_COMPAT` compatible.

#### Parameters

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `DEVICE_DT_DEFINE`.
- ... – other parameters as expected by `DEVICE_DT_DEFINE`.

`DEVICE_DT_NAME_GET(node_id)`

The name of the struct device object for `node_id`.

Return the full name of a device object symbol created by `DEVICE_DT_DEFINE()`, using the `dev_name` derived from `node_id`

It is meant to be used for declaring extern symbols pointing on device objects before using the `DEVICE_DT_GET` macro to get the device object.

#### Parameters

- `node_id` – The same as `node_id` provided to `DEVICE_DT_DEFINE()`

**Returns** The expanded name of the device object created by `DEVICE_DT_DEFINE()`

`DEVICE_DT_GET(node_id)`

Obtain a pointer to a device object by `node_id`.

Return the address of a device object created by `DEVICE_DT_INIT()`, using the `dev_name` derived from `node_id`

#### Parameters

- `node_id` – The same as `node_id` provided to `DEVICE_DT_DEFINE()`

**Returns** A pointer to the device object created by `DEVICE_DT_DEFINE()`

`DEVICE_DT_INST_GET(inst)`

Obtain a pointer to a device object for an instance of a `DT_DRV_COMPAT` compatible.

**Parameters**

- `inst` – instance number

`DEVICE_DT_GET_ANY(compat)`

Obtain a pointer to a device object by devicetree compatible.

If any enabled devicetree node has the given compatible and a device object was created from it, this returns that device.

If there no such devices, this returns `NULL`.

If there are multiple, this returns an arbitrary one.

If this returns non-`NULL`, the device must be checked for readiness before use, e.g. with [`device\_is\_ready\(\)`](#).

**Parameters**

- `compat` – lowercase-and-underscores devicetree compatible

**Returns** a pointer to a device, or `NULL`

`DEVICE_DT_GET_ONE(compat)`

Obtain a pointer to a device object by devicetree compatible.

If any enabled devicetree node has the given compatible and a device object was created from it, this returns that device.

If there no such devices, this throws a compilation error.

If there are multiple, this returns an arbitrary one.

If this returns non-`NULL`, the device must be checked for readiness before use, e.g. with [`device\_is\_ready\(\)`](#).

**Parameters**

- `compat` – lowercase-and-underscores devicetree compatible

**Returns** a pointer to a device

`DEVICE_GET(name)`

Obtain a pointer to a device object by name.

Return the address of a device object created by [`DEVICE\_DEFINE\(\)`](#), using the `dev_name` provided to [`DEVICE\_DEFINE\(\)`](#).

**Parameters**

- `name` – The same as `dev_name` provided to [`DEVICE\_DEFINE\(\)`](#)

**Returns** A pointer to the device object created by [`DEVICE\_DEFINE\(\)`](#)

`DEVICE_DECLARE(name)`

Declare a static device object.

This macro can be used at the top-level to declare a device, such that [`DEVICE\_GET\(\)`](#) may be used before the full declaration in [`DEVICE\_DEFINE\(\)`](#).

This is often useful when configuring interrupts statically in a device's init or per-instance config function, as the init function itself is required by [`DEVICE\_DEFINE\(\)`](#) and use of [`DEVICE\_GET\(\)`](#) inside it creates a circular dependency.

**Parameters**

- `name` – Device name

`SYS_INIT(_init_fn, _level, _prio)`

Run an initialization function at boot at specified priority.

This macro lets you run a function at system boot.

#### Parameters

- `_init_fn` – Pointer to the boot function to run
- `_level` – The initialization level at which configuration occurs. Must be one of the following symbols, which are listed in the order they are performed by the kernel:
  - `PRE_KERNEL_1`: Used for initialization objects that have no dependencies, such as those that rely solely on hardware present in the processor/SOC. These objects cannot use any kernel services during configuration, since they are not yet available.
  - `PRE_KERNEL_2`: Used for initialization objects that rely on objects initialized as part of the `PRE_KERNEL_1` level. These objects cannot use any kernel services during configuration, since they are not yet available.
  - `POST_KERNEL`: Used for initialization objects that require kernel services during configuration.
  - `POST_KERNEL_SMP`: Used for initialization objects that require kernel services during configuration after SMP initialization.
  - `APPLICATION`: Used for application components (i.e. non-kernel components) that need automatic configuration. These objects can use all services provided by the kernel during configuration.
- `_prio` – The initialization priority of the object, relative to other objects of the same initialization level. Specified as an integer value in the range 0 to 99; lower values indicate earlier initialization. Must be a decimal integer literal without leading zeroes or sign (e.g. 32), or an equivalent symbolic name (e.g. `#define MY_INIT_PRIO 32`); symbolic expressions are *not* permitted (e.g. `CONFIG_KERNEL_INIT_PRIORITY_DEFAULT + 5`).

## Typedefs

`typedef int16_t device_handle_t`

Type used to represent devices and functions.

The extreme values and zero have special significance. Negative values identify functionality that does not correspond to a Zephyr device, such as the system clock or a [SYS\\_INIT\(\)](#) function.

`typedef int (*device_visitor_callback_t)(const struct device *dev, void *context)`

Prototype for functions used when iterating over a set of devices.

Such a function may be used in API that identifies a set of devices and provides a visitor API supporting caller-specific interaction with each device in the set.

The visit is said to succeed if the visitor returns a non-negative value.

**Param dev** a device in the set being iterated

**Param context** state used to support the visitor function

**Return** A non-negative number to allow walking to continue, and a negative error code to case the iteration to stop.

## Functions

static inline [device\\_handle\\_t](#) device\_handle\_get(const struct [device](#) \*dev)

Get the handle for a given device.

### Parameters

- dev – the device for which a handle is desired.

**Returns** the handle for the device, or DEVICE\_HANDLE\_NULL if the device does not have an associated handle.

static inline const struct [device](#) \*device\_from\_handle([device\\_handle\\_t](#) dev\_handle)

Get the device corresponding to a handle.

### Parameters

- dev\_handle – the device handle

**Returns** the device that has that handle, or a null pointer if dev\_handle does not identify a device.

static inline const [device\\_handle\\_t](#) \*device\_required\_handles\_get(const struct [device](#) \*dev,  
size\_t \*count)

Get the set of handles for devicetree dependencies of this device.

These are the device dependencies inferred from devicetree.

### Parameters

- dev – the device for which dependencies are desired.
- count – pointer to a place to store the number of devices provided at the returned pointer. The value is not set if the call returns a null pointer. The value may be set to zero.

**Returns** a pointer to a sequence of \*count device handles, or a null pointer if dev does not provide dependency information.

static inline const [device\\_handle\\_t](#) \*device\_supported\_handles\_get(const struct [device](#) \*dev,  
size\_t \*count)

Get the set of handles that this device supports.

The set of supported devices is inferred from devicetree, and does not include any software constructs that may depend on the device.

### Parameters

- dev – the device for which supports are desired.
- count – pointer to a place to store the number of devices provided at the returned pointer. The value is not set if the call returns a null pointer. The value may be set to zero.

**Returns** a pointer to a sequence of \*count device handles, or a null pointer if dev does not provide dependency information.

int device\_required\_foreach(const struct [device](#) \*dev, [device\\_visitor\\_callback\\_t](#) visitor\_cb, void  
\*context)

Visit every device that dev directly requires.

Zephyr maintains information about which devices are directly required by another device; for example an I2C-based sensor driver will require an I2C controller for communication. Required devices can derive from statically-defined devicetree relationships or dependencies registered at runtime.

This API supports operating on the set of required devices. Example uses include making sure required devices are ready before the requiring device is used, and releasing them when the requiring device is no longer needed.

There is no guarantee on the order in which required devices are visited.

If the `visitor` function returns a negative value iteration is halted, and the returned value from the visitor is returned from this function.

---

**Note:** This API is not available to unprivileged threads.

---

#### Parameters

- `dev` – a device of interest. The devices that this device depends on will be used as the set of devices to visit. This parameter must not be null.
- `visitor_cb` – the function that should be invoked on each device in the dependency set. This parameter must not be null.
- `context` – state that is passed through to the visitor function. This parameter may be null if `visitor` tolerates a null `context`.

**Returns** The number of devices that were visited if all visits succeed, or the negative value returned from the first visit that did not succeed.

```
int device_supported_foreach(const struct device *dev, device\_visitor\_callback\_t visitor_cb, void *context)
```

Visit every device that `dev` directly supports.

Zephyr maintains information about which devices are directly supported by another device; for example an I2C controller will support an I2C-based sensor driver. Supported devices can derive from statically-defined devicetree relationships.

This API supports operating on the set of supported devices. Example uses include iterating over the devices connected to a regulator when it is powered on.

There is no guarantee on the order in which required devices are visited.

If the `visitor` function returns a negative value iteration is halted, and the returned value from the visitor is returned from this function.

---

**Note:** This API is not available to unprivileged threads.

---

#### Parameters

- `dev` – a device of interest. The devices that this device supports will be used as the set of devices to visit. This parameter must not be null.
- `visitor_cb` – the function that should be invoked on each device in the support set. This parameter must not be null.
- `context` – state that is passed through to the visitor function. This parameter may be null if `visitor` tolerates a null `context`.

**Returns** The number of devices that were visited if all visits succeed, or the negative value returned from the first visit that did not succeed.

```
const struct device *device_get_binding(const char *name)
```

Retrieve the device structure for a driver by name.

Device objects are created via the [DEVICE\\_DEFINE\(\)](#) macro and placed in memory by the linker. If a driver needs to bind to another driver it can use this function to retrieve the device structure of the lower level driver by the name the driver exposes to the system.

#### Parameters

- `name` – device name to search for. A null pointer, or a pointer to an empty string, will cause NULL to be returned.

**Returns** pointer to device structure; NULL if not found or cannot be used.

`int device_usable_check(const struct device *dev)`

Determine whether a device is ready for use.

This checks whether a device can be used, returning 0 if it can, and distinct error values that identify the reason if it cannot.

#### Return values

- 0 – if the device is usable.
- `-ENODEV` – if the device has not been initialized, the device pointer is NULL or the initialization failed.
- `other` – negative error codes to indicate additional conditions that make the device unusable.

`static inline bool device_is_ready(const struct device *dev)`

Verify that a device is ready for use.

Indicates whether the provided device pointer is for a device known to be in a state where it can be used with its standard API.

This can be used with device pointers captured from [DEVICE\\_DT\\_GET\(\)](#), which does not include the readiness checks of [device\\_get\\_binding\(\)](#). At minimum this means that the device has been successfully initialized, but it may take on further conditions (e.g. is not powered down).

#### Parameters

- `dev` – pointer to the device in question.

#### Return values

- `true` – if the device is ready for use.
- `false` – if the device is not ready for use or if a NULL device pointer is passed as argument.

`struct device_state`

*#include <device.h>* Runtime device dynamic structure (in RAM) per driver instance.

Fields in this are expected to be default-initialized to zero. The kernel driver infrastructure and driver access functions are responsible for ensuring that any non-zero initialization is done before they are accessed.

#### Public Members

`unsigned int init_res`

Non-negative result of initializing the device.

The absolute value returned when the device initialization function was invoked, or `UINT8_MAX` if the value exceeds an 8-bit integer. If `initialized` is also set, a zero value indicates initialization succeeded.

bool initialized

Indicates the device initialization function has been invoked.

struct device

*#include <device.h>* Runtime device structure (in ROM) per driver instance.

### Public Members

const char \*name

Name of the device instance

const void \*config

Address of device instance config information

const void \*api

Address of the API structure exposed by the device instance

struct [device\\_state](#) \*const state

Address of the common device state

void \*const data

Address of the device instance private data

const [device\\_handle\\_t](#) \*const handles

optional pointer to handles associated with the device.

This encodes a sequence of sets of device handles that have some relationship to this node. The individual sets are extracted with dedicated API, such as [device\\_required\\_handles\\_get\(\)](#).

## 7.8 Display Interface

### 7.8.1 API Reference

#### Generic Display Interface

group display\_interface

Display Interface.

#### Typedefs

typedef int (\*display\_blanking\_on\_api)(const struct [device](#) \*dev)

Callback API to turn on display blanking See [display\\_blanking\\_on\(\)](#) for argument description.

typedef int (\*display\_blanking\_off\_api)(const struct [device](#) \*dev)

Callback API to turn off display blanking See [display\\_blanking\\_off\(\)](#) for argument description.

```
typedef int (*display_write_api)(const struct device *dev, const uint16_t x, const uint16_t y,  
const struct display_buffer_descriptor *desc, const void *buf)
```

Callback API for writing data to the display See [display\\_write\(\)](#) for argument description.

```
typedef int (*display_read_api)(const struct device *dev, const uint16_t x, const uint16_t y,  
const struct display_buffer_descriptor *desc, void *buf)
```

Callback API for reading data from the display See [display\\_read\(\)](#) for argument description.

```
typedef void (*display_get_framebuffer_api)(const struct device *dev)
```

Callback API to get framebuffer pointer See [display\\_get\\_framebuffer\(\)](#) for argument description.

```
typedef int (*display_set_brightness_api)(const struct device *dev, const uint8_t brightness)
```

Callback API to set display brightness See [display\\_set\\_brightness\(\)](#) for argument description.

```
typedef int (*display_set_contrast_api)(const struct device *dev, const uint8_t contrast)
```

Callback API to set display contrast See [display\\_set\\_contrast\(\)](#) for argument description.

```
typedef void (*display_get_capabilities_api)(const struct device *dev, struct  
display_capabilities *capabilities)
```

Callback API to get display capabilities See [display\\_get\\_capabilities\(\)](#) for argument description.

```
typedef int (*display_set_pixel_format_api)(const struct device *dev, const enum  
display_pixel_format pixel_format)
```

Callback API to set pixel format used by the display See [display\\_set\\_pixel\\_format\(\)](#) for argument description.

```
typedef int (*display_set_orientation_api)(const struct device *dev, const enum  
display_orientation orientation)
```

Callback API to set orientation used by the display See [display\\_set\\_orientation\(\)](#) for argument description.

## Enums

```
enum display_pixel_format
```

Display pixel formats.

Display pixel format enumeration.

In case a pixel format consists out of multiple bytes the byte order is big endian.

*Values:*

```
enumerator PIXEL_FORMAT_RGB_888 = BIT(0)
```

```
enumerator PIXEL_FORMAT_MONO01 = BIT(1)
```

```
enumerator PIXEL_FORMAT_MONO10 = BIT(2)
```

```
enumerator PIXEL_FORMAT_ARGB_8888 = BIT(3)
```

enumerator PIXEL\_FORMAT\_RGB\_565 = *BIT*(4)

enumerator PIXEL\_FORMAT\_BGR\_565 = *BIT*(5)

enum display\_screen\_info

*Values:*

enumerator SCREEN\_INFO\_MONO\_VTILED = *BIT*(0)

If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.

enumerator SCREEN\_INFO\_MONO\_MSB\_FIRST = *BIT*(1)

If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.

enumerator SCREEN\_INFO\_EPD = *BIT*(2)

Electrophoretic Display.

enumerator SCREEN\_INFO\_DOUBLE\_BUFFER = *BIT*(3)

Screen has two alternating ram buffers

enumerator SCREEN\_INFO\_X\_ALIGNMENT\_WIDTH = *BIT*(4)

Screen has x alignment constrained to width.

enum display\_orientation

Enumeration with possible display orientation.

*Values:*

enumerator DISPLAY\_ORIENTATION\_NORMAL

enumerator DISPLAY\_ORIENTATION\_ROTATED\_90

enumerator DISPLAY\_ORIENTATION\_ROTATED\_180

enumerator DISPLAY\_ORIENTATION\_ROTATED\_270

## Functions

```
static inline int display_write(const struct device *dev, const uint16_t x, const uint16_t y, const
                               struct display_buffer_descriptor *desc, const void *buf)
```

Write data to display.

### Parameters

- dev – Pointer to device structure
- x – x Coordinate of the upper left corner where to write the buffer
- y – y Coordinate of the upper left corner where to write the buffer
- desc – Pointer to a structure describing the buffer layout
- buf – Pointer to buffer array

**Return values** 0 – on success else negative errno code.

```
static inline int display_read(const struct device *dev, const uint16_t x, const uint16_t y, const
                             struct display_buffer_descriptor *desc, void *buf)
```

Read data from display.

**Parameters**

- dev – Pointer to device structure
- x – x Coordinate of the upper left corner where to read from
- y – y Coordinate of the upper left corner where to read from
- desc – Pointer to a structure describing the buffer layout
- buf – Pointer to buffer array

**Return values** 0 – on success else negative errno code.

```
static inline void *display_get_framebuffer(const struct device *dev)
```

Get pointer to framebuffer for direct access.

**Parameters**

- dev – Pointer to device structure

**Return values** Pointer – to frame buffer or NULL if direct framebuffer access is not supported

```
static inline int display_blanking_on(const struct device *dev)
```

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.

In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

**Parameters**

- dev – Pointer to device structure

**Return values** 0 – on success else negative errno code.

```
static inline int display_blanking_off(const struct device *dev)
```

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

**Parameters**

- dev – Pointer to device structure

**Return values** 0 – on success else negative errno code.

```
static inline int display_set_brightness(const struct device *dev, uint8_t brightness)
```

Set the brightness of the display.

Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

**Parameters**

- dev – Pointer to device structure
- brightness – Brightness in steps of 1/256

**Return values** 0 – on success else negative errno code.

```
static inline int display_set_contrast(const struct device *dev, uint8_t contrast)
```

Set the contrast of the display.

Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

**Parameters**

- `dev` – Pointer to device structure
- `contrast` – Contrast in steps of 1/256

**Return values** 0 – on success else negative errno code.

```
static inline void display_get_capabilities(const struct device *dev, struct display_capabilities *capabilities)
```

Get display capabilities.

**Parameters**

- `dev` – Pointer to device structure
- `capabilities` – Pointer to capabilities structure to populate

```
static inline int display_set_pixel_format(const struct device *dev, const enum display_pixel_format pixel_format)
```

Set pixel format used by the display.

**Parameters**

- `dev` – Pointer to device structure
- `pixel_format` – Pixel format to be used by display

**Return values** 0 – on success else negative errno code.

```
static inline int display_set_orientation(const struct device *dev, const enum display_orientation orientation)
```

Set display orientation.

**Parameters**

- `dev` – Pointer to device structure
- `orientation` – Orientation to be used by display

**Return values** 0 – on success else negative errno code.

```
struct display_capabilities
```

*#include <display.h>* Structure holding display capabilities.

**Public Members**

```
uint16_t x_resolution
```

Display resolution in the X direction

```
uint16_t y_resolution
```

Display resolution in the Y direction

```
uint32_t supported_pixel_formats
```

Bitwise or of pixel formats supported by the display

uint32\_t screen\_info

Information about display panel

enum [display\\_pixel\\_format](#) current\_pixel\_format

Currently active pixel format for the display

enum [display\\_orientation](#) current\_orientation

Current display orientation

struct display\_buffer\_descriptor

*#include <display.h>* Structure to describe display data buffer layout.

### Public Members

uint32\_t buf\_size

Data buffer size in bytes

uint16\_t width

Data buffer row width in pixels

uint16\_t height

Data buffer column height in pixels

uint16\_t pitch

Number of pixels between consecutive rows in the data buffer

struct display\_driver\_api

*#include <display.h>* Display driver API which a display driver should expose.

## Grove LCD Display

group grove\_display

Grove display APIs.

## Functions

void glcd\_print(const struct [device](#) \*port, char \*data, uint32\_t size)

Send text to the screen.

### Parameters

- port – Pointer to device structure for driver instance.
- data – the ASCII text to display
- size – the length of the text in bytes

void glcd\_cursor\_pos\_set(const struct [device](#) \*port, uint8\_t col, uint8\_t row)

Set text cursor position for next additions.

### Parameters

- port – Pointer to device structure for driver instance.
- col – the column for the cursor to be moved to (0-15)
- row – the row it should be moved to (0 or 1)

```
void glcd_clear(const struct device *port)
```

Clear the current display.

**Parameters**

- port – Pointer to device structure for driver instance.

```
void glcd_display_state_set(const struct device *port, uint8_t opt)
```

Function to change the display state.

This function provides the user the ability to change the state of the display as per needed. Controlling things like powering on or off the screen, the option to display the cursor or not, and the ability to blink the cursor.

**Parameters**

- port – Pointer to device structure for driver instance.
- opt – An 8bit bitmask of GLCD\_DS\_\* options.

```
uint8_t glcd_display_state_get(const struct device *port)
```

return the display feature set associated with the device

**Parameters**

- port – the Grove LCD to get the display features set

**Returns** the display feature set associated with the device.

```
void glcd_input_state_set(const struct device *port, uint8_t opt)
```

Function to change the input state.

This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text

**Parameters**

- port – Pointer to device structure for driver instance.
- opt – A bitmask of GLCD\_IS\_\* options

```
uint8_t glcd_input_state_get(const struct device *port)
```

return the input set associated with the device

**Parameters**

- port – the Grove LCD to get the input features set

**Returns** the input set associated with the device.

```
void glcd_function_set(const struct device *port, uint8_t opt)
```

Function to set the functional state of the display.

This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

**Parameters**

- port – Pointer to device structure for driver instance.
- opt – A bitmask of GLCD\_FS\_\* options

```
uint8_t glcd_function_get(const struct device *port)
```

return the function set associated with the device

**Parameters**

- port – the Grove LCD to get the functions set

**Returns** the function features set associated with the device.

```
void glcd_color_select(const struct device *port, uint8_t color)
```

Set LCD background to a predefined color.

**Parameters**

- `port` – Pointer to device structure for driver instance.
- `color` – One of the predefined color options

```
void glcd_color_set(const struct device *port, uint8_t r, uint8_t g, uint8_t b)
```

Set LCD background to custom RGB color value.

**Parameters**

- `port` – Pointer to device structure for driver instance.
- `r` – A numeric value for the red color (max is 255)
- `g` – A numeric value for the green color (max is 255)
- `b` – A numeric value for the blue color (max is 255)

```
int glcd_initialize(const struct device *port)
```

Initialize the Grove LCD panel.

**Parameters**

- `port` – Pointer to device structure for driver instance.

**Returns** Returns 0 if all passes

## BBC micro:bit Display

*group* `mb_display`

BBC micro:bit display APIs.

## Defines

```
MB_IMAGE(_rows...)
```

Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row's first value, top-right is the first rows last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

**Parameters**

- `_rows` – Each of the 5 rows represented as a 5-value column array.

**Returns** Image bitmap that can be passed e.g. to [mb\\_display\\_image\(\)](#).

## Enums

enum mb\_display\_mode

Display mode.

First 16 bits are reserved for modes, last 16 for flags.

*Values:*

enumerator MB\_DISPLAY\_MODE\_DEFAULT

Default mode (“single” for images, “scroll” for text).

enumerator MB\_DISPLAY\_MODE\_SINGLE

Display images sequentially, one at a time.

enumerator MB\_DISPLAY\_MODE\_SCROLL

Display images by scrolling.

enumerator MB\_DISPLAY\_FLAG\_LOOP = *BIT*(16)

Loop back to the beginning when reaching the last image.

## Functions

struct mb\_display \*mb\_display\_get(void)

Get a pointer to the BBC micro:bit display object.

**Returns** Pointer to display object.

void mb\_display\_image(struct mb\_display \*disp, uint32\_t mode, int32\_t duration, const struct *mb\_image* \*img, uint8\_t img\_count)

Display one or more images on the BBC micro:bit LED display.

This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.

### Parameters

- *disp* – Display object.
- *mode* – One of the MB\_DISPLAY\_MODE\_\* options.
- *duration* – Duration how long to show each image (in milliseconds), or SYS\_FOREVER\_MS.
- *img* – Array of image bitmaps (struct *mb\_image* objects).
- *img\_count* – Number of images in ‘img’ array.

void mb\_display\_print(struct mb\_display \*disp, uint32\_t mode, int32\_t duration, const char \*fmt, ...)

Print a string of characters on the BBC micro:bit LED display.

This function takes a printf-style format string and outputs it in a scrolling fashion to the display.

The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

### Parameters

- `disp` – Display object.
- `mode` – One of the `MB_DISPLAY_MODE_*` options.
- `duration` – Duration how long to show each character (in milliseconds), or `SYS_FOREVER_MS`.
- `fmt` – printf-style format string
- `...` – Optional list of format arguments.

`void mb_display_stop(struct mb_display *disp)`

Stop the ongoing display of an image.

#### Parameters

- `disp` – Display object.

`struct mb_image`

*#include <mb\_display.h>* Representation of a BBC micro:bit display image.

This struct should normally not be used directly, rather created using the [MB\\_IMAGE\(\)](#) macro.

## Monochrome Character Framebuffer

*group* `monochrome_character_framebuffer`

Public Monochrome Character Framebuffer API.

### Defines

`FONT_ENTRY_DEFINE(_name, _width, _height, _caps, _data, _fc, _lc)`

Macro for creating a font entry.

#### Parameters

- `_name` – Name of the font entry.
- `_width` – Width of the font in pixels
- `_height` – Height of the font in pixels.
- `_caps` – Font capabilities.
- `_data` – Raw data of the font.
- `_fc` – Character mapped to first font element.
- `_lc` – Character mapped to last font element.

### Enums

`enum cfb_display_param`

*Values:*

enumerator `CFB_DISPLAY_HEIGHT = 0`

enumerator `CFB_DISPLAY_WIDTH`

enumerator CFB\_DISPLAY\_PPT

enumerator CFB\_DISPLAY\_ROWS

enumerator CFB\_DISPLAY\_COLS

enum cfb\_font\_caps

*Values:*

enumerator CFB\_FONT\_MONO\_VPACKED = *BIT*(0)

enumerator CFB\_FONT\_MONO\_HPACKED = *BIT*(1)

enumerator CFB\_FONT\_MSB\_FIRST = *BIT*(2)

## Functions

int cfb\_print(const struct *device* \*dev, char \*str, uint16\_t x, uint16\_t y)

Print a string into the framebuffer.

### Parameters

- dev – Pointer to device structure for driver instance
- str – String to print
- x – Position in X direction of the beginning of the string
- y – Position in Y direction of the beginning of the string

**Returns** 0 on success, negative value otherwise

int cfb\_framebuffer\_clear(const struct *device* \*dev, bool clear\_display)

Clear framebuffer.

### Parameters

- dev – Pointer to device structure for driver instance
- clear\_display – Clear the display as well

**Returns** 0 on success, negative value otherwise

int cfb\_framebuffer\_invert(const struct *device* \*dev)

Invert Pixels.

### Parameters

- dev – Pointer to device structure for driver instance

**Returns** 0 on success, negative value otherwise

int cfb\_framebuffer\_finalize(const struct *device* \*dev)

Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

### Parameters

- dev – Pointer to device structure for driver instance

**Returns** 0 on success, negative value otherwise

```
int cfb_get_display_parameter(const struct device *dev, enum cfb_display_param)
```

Get display parameter.

**Parameters**

- *dev* – Pointer to device structure for driver instance
- *cfb\_display\_param* – One of the display parameters

**Returns** Display parameter value

```
int cfb_framebuffer_set_font(const struct device *dev, uint8_t idx)
```

Set font.

**Parameters**

- *dev* – Pointer to device structure for driver instance
- *idx* – Font index

**Returns** 0 on success, negative value otherwise

```
int cfb_get_font_size(const struct device *dev, uint8_t idx, uint8_t *width, uint8_t *height)
```

Get font size.

**Parameters**

- *dev* – Pointer to device structure for driver instance
- *idx* – Font index
- *width* – Pointers to the variable where the font width will be stored.
- *height* – Pointers to the variable where the font height will be stored.

**Returns** 0 on success, negative value otherwise

```
int cfb_get_numof_fonts(const struct device *dev)
```

Get number of fonts.

**Parameters**

- *dev* – Pointer to device structure for driver instance

**Returns** number of fonts

```
int cfb_framebuffer_init(const struct device *dev)
```

Initialize Character Framebuffer.

**Parameters**

- *dev* – Pointer to device structure for driver instance

**Returns** 0 on success, negative value otherwise

```
struct cfb_font
```

```
    #include <cfb.h>
```

## 7.9 Error Detection And Correction (EDAC) API

### 7.9.1 API Reference

*group edac*

## Enums

enum edac\_error\_type

EDAC error type.

*Values:*

enumerator EDAC\_ERROR\_TYPE\_DRAM\_COR = *BIT*(0)

Correctable error type

enumerator EDAC\_ERROR\_TYPE\_DRAM\_UC = *BIT*(1)

Uncorrectable error type

## Functions

static inline int edac\_inject\_set\_param1(const struct *device* \*dev, uint64\_t value)

Set injection parameter param1.

Set first error injection parameter value.

### Parameters

- dev – Pointer to the device structure
- value – First injection parameter

### Return values

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, other error code otherwise

static inline int edac\_inject\_get\_param1(const struct *device* \*dev, uint64\_t \*value)

Get injection parameter param1.

Get first error injection parameter value.

### Parameters

- dev – Pointer to the device structure
- value – Pointer to the first injection parameter

### Return values

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

static inline int edac\_inject\_set\_param2(const struct *device* \*dev, uint64\_t value)

Set injection parameter param2.

Set second error injection parameter value.

### Parameters

- dev – Pointer to the device structure
- value – Second injection parameter

### Return values

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

```
static inline int edac_inject_get_param2(const struct device *dev, uint64_t *value)
```

Get injection parameter param2.

**Parameters**

- dev – Pointer to the device structure
- value – Pointer to the second injection parameter

**Return values**

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

```
static inline int edac_inject_set_error_type(const struct device *dev, uint32_t error_type)
```

Set error type value.

Set the value of error type to be injected

**Parameters**

- dev – Pointer to the device structure
- error\_type – Error type value

**Return values**

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

```
static inline int edac_inject_get_error_type(const struct device *dev, uint32_t *error_type)
```

Get error type value.

Get the value of error type to be injected

**Parameters**

- dev – Pointer to the device structure
- error\_type – Pointer to error type value

**Return values**

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

```
static inline int edac_inject_error_trigger(const struct device *dev)
```

Set injection control.

Trigger error injection.

**Parameters**

- dev – Pointer to the device structure

**Return values**

- -ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

```
static inline int edac_ecc_error_log_get(const struct device *dev, uint64_t *value)
```

Get ECC Error Log.

Read value of ECC Error Log.

**Parameters**

- dev – Pointer to the device structure
- value – Pointer to the ECC Error Log value

**Return values**

- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac\_ecc\_error\_log\_clear(const struct *device* \*dev)

Clear ECC Error Log.

Clear value of ECC Error Log.

**Parameters**

- dev – Pointer to the device structure

**Return values**

- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac\_parity\_error\_log\_get(const struct *device* \*dev, uint64\_t \*value)

Get Parity Error Log.

Read value of Parity Error Log.

**Parameters**

- dev – Pointer to the device structure
- value – Pointer to the parity Error Log value

**Return values**

- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac\_parity\_error\_log\_clear(const struct *device* \*dev)

Clear Parity Error Log.

Clear value of Parity Error Log.

**Parameters**

- dev – Pointer to the device structure

**Return values**

- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac\_errors\_cor\_get(const struct *device* \*dev)

Get number of correctable errors.

**Parameters**

- dev – Pointer to the device structure

**Return values**

- num – Number of correctable errors
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac\_errors\_uc\_get(const struct *device* \*dev)

Get number of uncorrectable errors.

**Parameters**

- dev – Pointer to the device structure

**Return values**

- num – Number of uncorrectable errors
- -ENOSYS – if the mandatory interface is not implemented

```
static inline int edac_notify_callback_set(const struct device *dev, edac_notify_callback_f cb)
```

Register callback function for memory error exception

This callback runs in interrupt context

#### Parameters

- dev – EDAC driver device to install callback
- cb – Callback function pointer

#### Return values

- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

```
struct edac_driver_api
```

*#include <edac.h>* EDAC driver API.

This is the mandatory API any EDAC driver needs to expose.

## 7.10 File Systems

Zephyr RTOS Virtual Filesystem Switch (VFS) allows applications to mount multiple file systems at different mount points (e.g., /fatfs and /lfs). The mount point data structure contains all the necessary information required to instantiate, mount, and operate on a file system. The File system Switch decouples the applications from directly accessing an individual file system's specific API or internal functions by introducing file system registration mechanisms.

In Zephyr, any file system implementation or library can be plugged into or pulled out through a file system registration API. Each file system implementation must have a globally unique integer identifier; use *FS\_TYPE\_EXTERNAL\_BASE* to avoid clashes with in-tree identifiers.

```
int fs_register(int type, const struct fs_file_system_t *fs);

int fs_unregister(int type, const struct fs_file_system_t *fs);
```

Zephyr RTOS supports multiple instances of a file system by making use of the mount point as the disk volume name, which is used by the file system library while formatting or mounting a disk.

A file system is declared as:

```
static struct fs_mount_t mp = {
    .type = FS_FATFS,
    .mnt_point = FATFS_MNTP,
    .fs_data = &fat_fs,
};
```

where

- FS\_FATFS is the file system type like FATFS or LittleFS.
- FATFS\_MNTP is the mount point where the file system will be mounted.
- fat\_fs is the file system data which will be used by fs\_mount() API.

### 7.10.1 Samples

Samples for the VFS are mainly supplied in `samples/subsys/fs`, although various examples of the VFS usage are provided as important functionalities in samples for different subsystems. Here is the list of samples worth looking at:

- `samples/subsys/fs/fat_fs` is an example of FAT file system usage with SDHC media;
- `samples/subsys/shell/fs` is an example of Shell fs subsystem, using internal flash partition formatted to LittleFS;
- `samples/subsys/usb/mass/` **example of USB Mass Storage device that uses FAT FS driver with RAM or SPI connected FLASH**, or LittleFS in flash, depending on the sample configuration.

### 7.10.2 API Reference

*group* `file_system_api`

File System APIs.

#### `fs_open` open and creation mode flags

`FS_O_READ`

Open for read flag

`FS_O_WRITE`

Open for write flag

`FS_O_RDWR`

Open for read-write flag combination

`FS_O_MODE_MASK`

Bitmask for read and write flags

`FS_O_CREATE`

Create file if it does not exist

`FS_O_APPEND`

Open/create file for append

`FS_O_FLAGS_MASK`

Bitmask for open/create flags

`FS_O_MASK`

Bitmask for open flags

#### `fs_seek` whence parameter values

`FS_SEEK_SET`

Seek from the beginning of file

FS\_SEEK\_CUR

Seek from a current position

FS\_SEEK\_END

Seek from the end of file

## Defines

FS\_MOUNT\_FLAG\_NO\_FORMAT

Flag prevents formatting device if requested file system not found

FS\_MOUNT\_FLAG\_READ\_ONLY

Flag makes mounted file system read-only

FS\_MOUNT\_FLAG\_AUTOMOUNT

Flag used in pre-defined mount structures that are to be mounted on startup.

This flag has no impact in user-defined mount structures.

FSTAB\_ENTRY\_DT\_MOUNT\_FLAGS(node\_id)

FS\_FSTAB\_ENTRY(node\_id)

The name under which a zephyr,fstab entry mount structure is defined.

FS\_FSTAB\_DECLARE\_ENTRY(node\_id)

Generate a declaration for the externally defined fstab entry.

This will evaluate to the name of a struct `fs_mount_t` object.

## Enums

enum fs\_dir\_entry\_type

*Values:*

enumerator FS\_DIR\_ENTRY\_FILE = 0

Identifier for file entry

enumerator FS\_DIR\_ENTRY\_DIR

Identifier for directory entry

enum [anonymous]

Enumeration to uniquely identify file system types.

Zephyr supports in-tree file systems and external ones. Each requires a unique identifier used to register the file system implementation and to associate a mount point with the file system type. This anonymous enum defines global identifiers for the in-tree file systems.

External file systems should be registered using unique identifiers starting at FS\_TYPE\_EXTERNAL\_BASE. It is the responsibility of applications that use external file systems to ensure that these identifiers are unique if multiple file system implementations are used by the application.

*Values:*

enumerator FS\_FATFS = 0

Identifier for in-tree FatFS file system.

enumerator FS\_LITTLEFS

Identifier for in-tree LittleFS file system.

enumerator FS\_TYPE\_EXTERNAL\_BASE

Base identifier for external file systems.

## Functions

static inline void fs\_file\_t\_init(struct *fs\_file\_t* \*zfp)

Initialize *fs\_file\_t* object.

Initializes the *fs\_file\_t* object; the function needs to be invoked on object before first use with fs\_open.

### Parameters

- zfp – Pointer to file object

static inline void fs\_dir\_t\_init(struct *fs\_dir\_t* \*zdp)

Initialize *fs\_dir\_t* object.

Initializes the *fs\_dir\_t* object; the function needs to be invoked on object before first use with fs\_opendir.

### Parameters

- zdp – Pointer to file object

int fs\_open(struct *fs\_file\_t* \*zfp, const char \*file\_name, fs\_mode\_t flags)

Open or create file.

Opens or possibly creates a file and associates a stream with it.

flags can be 0 or a binary combination of one or more of the following identifiers:

- FS\_O\_READ open for read
- FS\_O\_WRITE open for write
- FS\_O\_RDWR open for read/write (FS\_O\_READ | FS\_O\_WRITE)
- FS\_O\_CREATE create file if it does not exist
- FS\_O\_APPEND move to end of file before each write

If flags are set to 0 the function will attempt to open an existing file with no read/write access; this may be used to e.g. check if the file exists.

### Parameters

- zfp – Pointer to a file object
- file\_name – The name of a file to open
- flags – The mode flags

### Return values

- 0 – on success;
- -EINVAL – when a bad file name is given;

- -EROFS – when opening read-only file for write, or attempting to create a file on a system that has been mounted with the FS\_MOUNT\_FLAG\_READ\_ONLY flag;
- -ENOENT – when the file path is not possible (bad mount point);
- <0 – an other negative errno code, depending on a file system back-end.

int fs\_close(struct *fs\_file\_t* \*zfp)

Close file.

Flushes the associated stream and closes the file.

#### Parameters

- zfp – Pointer to the file object

#### Return values

- 0 – on success;
- <0 – a negative errno code on error.

int fs\_unlink(const char \*path)

Unlink file.

Deletes the specified file or directory

#### Parameters

- path – Path to the file or directory to delete

#### Return values

- 0 – on success;
- -EROFS – if file is read-only, or when file system has been mounted with the FS\_MOUNT\_FLAG\_READ\_ONLY flag;
- -ENOTSUP – when not implemented by underlying file system driver;
- <0 – an other negative errno code on error.

int fs\_rename(const char \*from, const char \*to)

Rename file or directory.

Performs a rename and / or move of the specified source path to the specified destination. The source path can refer to either a file or a directory. All intermediate directories in the destination path must already exist. If the source path refers to a file, the destination path must contain a full filename path, rather than just the new parent directory. If an object already exists at the specified destination path, this function causes it to be unlinked prior to the rename (i.e., the destination gets clobbered).

---

**Note:** Current implementation does not allow moving files between mount points.

---

#### Parameters

- from – The source path
- to – The destination path

#### Return values

- 0 – on success;
- -ENOTSUP – when not implemented by underlying file system driver;
- <0 – an other negative errno code on error.

```
ssize_t fs_read(struct fs_file_t *zfp, void *ptr, size_t size)
```

Read file.

Reads up to `size` bytes of data to `ptr` pointed buffer, returns number of bytes read. A returned value may be lower than `size` if there were fewer bytes available than requested.

#### Parameters

- `zfp` – Pointer to the file object
- `ptr` – Pointer to the data buffer
- `size` – Number of bytes to be read

#### Return values

- $\geq 0$  – a number of bytes read, on success;
- $< 0$  – a negative `errno` code on error.

```
ssize_t fs_write(struct fs_file_t *zfp, const void *ptr, size_t size)
```

Write file.

Attempts to write `size` number of bytes to the specified file. If a negative value is returned from the function, the file pointer has not been advanced. If the function returns a non-negative number that is lower than `size`, the global `errno` variable should be checked for an error code, as the device may have no free space for data.

#### Parameters

- `zfp` – Pointer to the file object
- `ptr` – Pointer to the data buffer
- `size` – Number of bytes to be written

#### Return values

- $\geq 0$  – a number of bytes written, on success;
- `-ENOTSUP` – when not implemented by underlying file system driver;
- $< 0$  – an other negative `errno` code on error.

```
int fs_seek(struct fs_file_t *zfp, off_t offset, int whence)
```

Seek file.

Moves the file position to a new location in the file. The `offset` is added to file position based on the `whence` parameter.

#### Parameters

- `zfp` – Pointer to the file object
- `offset` – Relative location to move the file pointer to
- `whence` – Relative location from where `offset` is to be calculated.
  - `FS_SEEK_SET` for the beginning of the file;
  - `FS_SEEK_CUR` for the current position;
  - `FS_SEEK_END` for the end of the file.

#### Return values

- `0` – on success;
- `-ENOTSUP` – if not supported by underlying file system driver;
- $< 0$  – an other negative `errno` code on error.

```
off_t fs_tell(struct fs_file_t *zfp)
```

Get current file position.

Retrieves and returns the current position in the file stream.

The current revision does not validate the file object.

#### Parameters

- `zfp` – Pointer to the file object

#### Return values

- $\geq 0$  – a current position in file;
- `-ENOTSUP` – if not supported by underlying file system driver;
- $< 0$  – an other negative errno code on error.

```
int fs_truncate(struct fs_file_t *zfp, off_t length)
```

Truncate or extend an open file to a given size.

Truncates the file to the new length if it is shorter than the current size of the file. Expands the file if the new length is greater than the current size of the file. The expanded region would be filled with zeroes.

---

**Note:** In the case of expansion, if the volume got full during the expansion process, the function will expand to the maximum possible length and return success. Caller should check if the expanded size matches the requested length.

---

#### Parameters

- `zfp` – Pointer to the file object
- `length` – New size of the file in bytes

#### Return values

- `0` – on success;
- `-ENOTSUP` – when not implemented by underlying file system driver;
- $< 0$  – an other negative errno code on error.

```
int fs_sync(struct fs_file_t *zfp)
```

Flush cached write data buffers of an open file.

The function flushes the cache of an open file; it can be invoked to ensure data gets written to the storage media immediately, e.g. to avoid data loss in case if power is removed unexpectedly.

---

**Note:** Closing a file will cause caches to be flushed correctly so the function need not be called when the file is being closed.

---

#### Parameters

- `zfp` – Pointer to the file object

#### Return values

- `0` – on success;
- $< 0$  – a negative errno code on error.

`int fs_mkdir(const char *path)`

Directory create.

Creates a new directory using specified path.

**Parameters**

- path – Path to the directory to create

**Return values**

- 0 – on success;
- -ENOTSUP – when not implemented by underlying file system driver;
- <0 – an other negative errno code on error

`int fs_opendir(struct fs_dir_t *zdp, const char *path)`

Directory open.

Opens an existing directory specified by the path.

**Parameters**

- zdp – Pointer to the directory object
- path – Path to the directory to open

**Return values**

- 0 – on success;
- <0 – a negative errno code on error.

`int fs_readdir(struct fs_dir_t *zdp, struct fs_dirent *entry)`

Directory read entry.

Reads directory entries of an open directory. In end-of-dir condition, the function will return 0 and set the entry->name[0] to 0.

---

**Note:** : Most existing underlying file systems do not generate POSIX special directory entries “.” or “..”. For consistency the abstraction layer will remove these from lower layer results so higher layers see consistent results.

---

**Parameters**

- zdp – Pointer to the directory object
- entry – Pointer to zfs\_dirent structure to read the entry into

**Return values**

- 0 – on success or end-of-dir;;
- <0 – a negative errno code on error.

`int fs_closedir(struct fs_dir_t *zdp)`

Directory close.

Closes an open directory.

**Parameters**

- zdp – Pointer to the directory object

**Return values**

- 0 – on success;
- <0 – a negative errno code on error.

```
int fs_mount(struct fs_mount_t *mp)
```

Mount filesystem.

Perform steps needed for mounting a file system like calling the file system specific mount function and adding the mount point to mounted file system list.

---

**Note:** Current implementation of ELM FAT driver allows only following mount points: “/RAM:”, “/NAND:”, “/CF:”, “/SD:”, “/SD2:”, “/USB:”, “/USB2:”, “/USB3:” or mount points that consist of single digit, e.g: “/0:”, “/1:” and so forth.

---

#### Parameters

- `mp` – Pointer to the `fs_mount_t` structure. Referenced object is not changed if the mount operation failed. A reference is captured in the fs infrastructure if the mount operation succeeds, and the application must not mutate the structure contents until `fs_unmount` is successfully invoked on the same pointer.

#### Return values

- 0 – on success;
- `-ENOENT` – when file system type has not been registered;
- `-ENOTSUP` – when not supported by underlying file system driver;
- `-EROFS` – if system requires formatting but `FS_MOUNT_FLAG_READ_ONLY` has been set;
- `<0` – an other negative `errno` code on error.

```
int fs_unmount(struct fs_mount_t *mp)
```

Unmount filesystem.

Perform steps needed to unmount a file system like calling the file system specific unmount function and removing the mount point from mounted file system list.

#### Parameters

- `mp` – Pointer to the `fs_mount_t` structure

#### Return values

- 0 – on success;
- `-EINVAL` – if no system has been mounted at given mount point;
- `-ENOTSUP` – when not supported by underlying file system driver;
- `<0` – an other negative `errno` code on error.

```
int fs_readmount(int *index, const char **name)
```

Get path of mount point at index.

This function iterates through the list of mount points and returns the directory name of the mount point at the given `index`. On success `index` is incremented and `name` is set to the mount directory name. If a mount point with the given `index` does not exist, `name` will be set to `NULL`.

#### Parameters

- `index` – Pointer to mount point index
- `name` – Pointer to pointer to path name

#### Return values

- 0 – on success;
- `-ENOENT` – if there is no mount point with given index.

int fs\_stat(const char \*path, struct *fs\_dirent* \*entry)

File or directory status.

Checks the status of a file or directory specified by the path.

---

**Note:** The file on a storage device may not be updated until it is closed.

---

**Parameters**

- path – Path to the file or directory
- entry – Pointer to the *zfs\_dirent* structure to fill if the file or directory exists.

**Return values**

- 0 – on success;
- <0 – negative errno code on error.

int fs\_statvfs(const char \*path, struct *fs\_statvfs* \*stat)

Retrieves statistics of the file system volume.

Returns the total and available space in the file system volume.

**Parameters**

- path – Path to the mounted directory
- stat – Pointer to the *zfs\_statvfs* structure to receive the fs statistics

**Return values**

- 0 – on success;
- -ENOTSUP – when not implemented by underlying file system driver;
- <0 – an other negative errno code on error.

int fs\_register(int type, const struct *fs\_file\_system\_t* \*fs)

Register a file system.

Register file system with virtual file system.

**Parameters**

- type – Type of file system (ex: FS\_FATFS)
- fs – Pointer to File system

**Return values**

- 0 – on success;
- <0 – negative errno code on error.

int fs\_unregister(int type, const struct *fs\_file\_system\_t* \*fs)

Unregister a file system.

Unregister file system from virtual file system.

**Parameters**

- type – Type of file system (ex: FS\_FATFS)
- fs – Pointer to File system

**Return values**

- 0 – on success;
- <0 – negative errno code on error.

struct fs\_mount\_t

*#include <fs.h>* File system mount info structure.

**Param node** Entry for the fs\_mount\_list list

**Param type** File system type

**Param mnt\_point** Mount point directory name (ex: “/fatfs”)

**Param fs\_data** Pointer to file system specific data

**Param storage\_dev** Pointer to backend storage device

**Param mountp\_len** Length of Mount point string

**Param fs** Pointer to File system interface of the mount point

**Param flags** Mount flags

struct fs\_dirent

*#include <fs.h>* Structure to receive file or directory information.

Used in functions that reads the directory entries to get file or directory information.

**Param dir\_entry\_type** Whether file or directory

- FS\_DIR\_ENTRY\_FILE
- FS\_DIR\_ENTRY\_DIR

**Param name** Name of directory or file

**Param size** Size of file. 0 if directory

struct fs\_statvfs

*#include <fs.h>* Structure to receive volume statistics.

Used to retrieve information about total and available space in the volume.

**Param f\_bsize** Optimal transfer block size

**Param f\_frsize** Allocation unit size

**Param f\_blocks** Size of FS in f\_frsize units

**Param f\_bfree** Number of free blocks

struct fs\_file\_t

*#include <fs\_interface.h>* File object representing an open file.

The object needs to be initialized with function [fs\\_file\\_t\\_init\(\)](#).

**Param Pointer** to FATFS file object structure

**Param mp** Pointer to mount point structure

struct fs\_dir\_t

*#include <fs\_interface.h>* Directory object representing an open directory.

The object needs to be initialized with function [fs\\_dir\\_t\\_init\(\)](#).

**Param dirp** Pointer to directory object structure

**Param mp** Pointer to mount point structure

```
struct fs_file_system_t
```

*#include <fs\_sys.h>* File System interface structure.

- Param open** Opens or creates a file, depending on flags given
- Param read** Reads nbytes number of bytes
- Param write** Writes nbytes number of bytes
- Param lseek** Moves the file position to a new location in the file
- Param tell** Retrieves the current position in the file
- Param truncate** Truncates/expands the file to the new length
- Param sync** Flushes the cache of an open file
- Param close** Flushes the associated stream and closes the file
- Param opendir** Opens an existing directory specified by the path
- Param readdir** Reads directory entries of an open directory
- Param closedir** Closes an open directory
- Param mount** Mounts a file system
- Param unmount** Unmounts a file system
- Param unlink** Deletes the specified file or directory
- Param rename** Renames a file or directory
- Param mkdir** Creates a new directory using specified path
- Param stat** Checks the status of a file or directory specified by the path
- Param statvfs** Returns the total and available space on the file system volume

## 7.11 Iterable Sections

This page contains the reference documentation for the iterable sections APIs, which can be used for defining iterable areas of equally-sized data structures, that can be iterated on using [\*STRUCT\\_SECTION\\_FOREACH\(\)\*](#).

### 7.11.1 Usage

Iterable section elements are typically used by defining the data structure and associated initializer in a common header file, so that they can be instantiated anywhere in the code base.

```
struct my_data {
    int a, b;
};

#define DEFINE_DATA(name, _a, _b) \
    STRUCT_SECTION_ITERABLE(my_data, name) = { \
        .a = _a, \
        .b = _b, \
    }

...

DEFINE_DATA(d1, 1, 2);
```

(continues on next page)

(continued from previous page)

```
DEFINE_DATA(d2, 3, 4);  
DEFINE_DATA(d3, 5, 6);
```

Then the linker has to be setup to place the structure in a contiguous segment using one of the linker macros such as `ITERABLE_SECTION_RAM()` or `ITERABLE_SECTION_ROM()`. Custom linker snippets are normally declared using one of the `zephyr_linker_sources()` CMake functions, using the appropriate section identifier, `DATA_SECTIONS` for RAM structures and `SECTIONS` for ROM ones.

```
# CMakeLists.txt  
zephyr_linker_sources(DATA_SECTIONS iterables.ld)
```

```
# iterables.ld  
ITERABLE_SECTION_RAM(my_data, 4)
```

The data can then be accessed using `STRUCT_SECTION_FOREACH()`.

```
STRUCT_SECTION_FOREACH(my_data, data) {  
    printk("%p: a: %d, b: %d\n", data, data->a, data->b);  
}
```

---

**Note:** The linker is going to place the entries sorted by name, so the example above would visit `d1`, `d2` and `d3` in that order, regardless of how they were defined in the code.

---

## 7.11.2 API Reference

*group* `iterable_section_apis`

Iterable Sections APIs.

### Defines

`ITERABLE_SECTION_ROM(struct_type, subalign)`

Define a read-only iterable section output.

Define an output section which will set up an iterable area of equally-sized data structures. For use with `STRUCT_SECTION_ITERABLE()`. Input sections will be sorted by name, per ld's `SORT_BY_NAME`.

This macro should be used for read-only data.

Note that this keeps the symbols in the image even though they are not being directly referenced. Use this when symbols are indirectly referenced by iterating through the section.

`ITERABLE_SECTION_ROM_GC_ALLOWED(struct_type, subalign)`

Define a garbage collectable read-only iterable section output.

Define an output section which will set up an iterable area of equally-sized data structures. For use with `STRUCT_SECTION_ITERABLE()`. Input sections will be sorted by name, per ld's `SORT_BY_NAME`.

This macro should be used for read-only data.

Note that the symbols within the section can be garbage collected.

`ITERABLE_SECTION_RAM(struct_type, subalign)`

Define a read-write iterable section output.

Define an output section which will set up an iterable area of equally-sized data structures. For use with [STRUCT\\_SECTION\\_ITERABLE\(\)](#). Input sections will be sorted by name, per ld's `SORT_BY_NAME`.

This macro should be used for read-write data that is modified at runtime.

Note that this keeps the symbols in the image even though they are not being directly referenced. Use this when symbols are indirectly referenced by iterating through the section.

`ITERABLE_SECTION_RAM_GC_ALLOWED(struct_type, subalign)`

Define a garbage collectable read-write iterable section output.

Define an output section which will set up an iterable area of equally-sized data structures. For use with [STRUCT\\_SECTION\\_ITERABLE\(\)](#). Input sections will be sorted by name, per ld's `SORT_BY_NAME`.

This macro should be used for read-write data that is modified at runtime.

Note that the symbols within the section can be garbage collected.

`STRUCT_SECTION_ITERABLE(struct_type, name)`

Defines a new iterable section.

Convenience helper combining `__in_section()` and `Z_DECL_ALIGN()`. The section name is the struct type prepended with an underscore. The subsection is "static" and the subsubsection is the variable name.

In the linker script, create output sections for these using [ITERABLE\\_SECTION\\_ROM\(\)](#) or [ITERABLE\\_SECTION\\_RAM\(\)](#).

`STRUCT_SECTION_ITERABLE_ALTERNATE(out_type, struct_type, name)`

Defines an alternate data type iterable section.

Special variant of [STRUCT\\_SECTION\\_ITERABLE\(\)](#), for placing alternate data types within the iterable section of a specific data type. The data type sizes and semantics must be equivalent!

`STRUCT_SECTION_FOREACH(struct_type, iterator)`

Iterate over a specified iterable section.

Iterator for structure instances gathered by [STRUCT\\_SECTION\\_ITERABLE\(\)](#). The linker must provide a `<struct_type>_list_start` symbol and a `<struct_type>_list_end` symbol to mark the start and the end of the list of struct objects to iterate over. This is normally done using [ITERABLE\\_SECTION\\_ROM\(\)](#) or [ITERABLE\\_SECTION\\_RAM\(\)](#) in the linker script.

## 7.12 Formatted Output

Applications as well as Zephyr itself requires infrastructure to format values for user consumption. The standard C99 library `*printf()` functionality fulfills this need for streaming output devices or memory buffers, but in an embedded system devices may not accept streamed data and memory may not be available to store the formatted output.

Internal Zephyr API traditionally provided this both for `printf()` and for Zephyr's internal minimal libc, but with separate internal interfaces. Logging, tracing, shell, and other applications made use of either these APIs or standard libc routines based on build options.

The [cbprintf\(\)](#) public APIs convert C99 format strings and arguments, providing output produced one character at a time through a callback mechanism, replacing the original internal functions and providing support for almost all C99 format specifications. Existing use of `sprintf()` C libraries in Zephyr can be converted to [snprintfcb\(\)](#) to avoid pulling in libc implementations.

Several Kconfig options control the set of features that are enabled, allowing some control over features and memory usage:

- `:kconfig: `CONFIG_CBPRINTF_FULL_INTEGRAL`` or `:kconfig: `CONFIG_CBPRINTF_REDUCED_INTEGRAL``
- `:kconfig: `CONFIG_CBPRINTF_FP_SUPPORT``
- `:kconfig: `CONFIG_CBPRINTF_FP_A_SUPPORT``
- `:kconfig: `CONFIG_CBPRINTF_FP_ALWAYS_A``
- `:kconfig: `CONFIG_CBPRINTF_N_SPECIFIER``

`:kconfig: `CONFIG_CBPRINTF_LIBC_SUBSTS`` can be used to provide functions that behave like standard libc functions but use the selected cbprintf formatter rather than pulling in another formatter from libc.

In addition `:kconfig: `CONFIG_CBPRINTF_NANO`` can be used to revert back to the very space-optimized but limited formatter used for `printf()` before this capability was added.

### 7.12.1 Cbprintf Packaging

Typically, strings are formatted synchronously when a function from `printf` family is called. However, there are cases when it is beneficial that formatting is deferred. In that case, a state (format string and arguments) must be captured. Such state forms a self-contained package which contains format string and arguments. Additionally, package contains copies of all strings which are part of a format string (format string or any `%s` argument) and are identified as the one located in the read write memory. Package primary content resembles `va_list` stack frame thus standard formatting functions are used to process a package. Since package contains data which is processed as `va_list` frame, strict alignment must be maintained. Due to required padding, size of the package depends on alignment. When package is copied, it should be copied to a memory block with the same alignment as origin.

Package can be created using two methods:

- runtime - using `cbprintf_package()` or `cbvprintf_package()`. This method scans format string and based on detected format specifiers builds the package.
- static - types of arguments are detected at compile time by the preprocessor and package is created as simple assignments to a provided memory. This method is significantly faster than runtime (more than 15 times) but has following limitations: requires `_Generic` keyword (C11 feature) to be supported by the compiler and can only create a package that is known to have no string arguments (`%s`). `CBPRINTF_MUST_RUNTIME_PACKAGE` can be used to determine at compile time if static packaging can be applied. Macro determines need for runtime packaging based on presence of char pointers in the argument list so there are cases when it will be false positive, e.g. `%p` with char pointer.

Several Kconfig options control behavior of the packaging:

- `:kconfig: `CONFIG_CBPRINTF_PACKAGE_LONGDOUBLE``
- `:kconfig: `CONFIG_CBPRINTF_STATIC_PACKAGE_CHECK_ALIGNMENT``

#### Cbprintf package format

Format of the package contains paddings which are platform specific. Package consists of header which contains size of package (excluding appended strings) and number of appended strings. It is followed by the arguments which contains alignment paddings and resembles `va_list` stack frame. Finally, package optionally contains appended strings. Each string contains 1 byte header which contains index of the location where address argument is stored. During packaging address is set to null and before string formatting it is updated to point to the current string location within the package. Updating address argument must happen just before string formatting since address changes whenever package is copied.

Header  sizeof(void *)	1 byte: Argument list size including header and <i>fmt</i> (in 32 bit words)
	1 byte: Number of appended strings
	platform specific padding to sizeof(void *)
Arguments	Pointer to <i>fmt</i> (or null if <i>fmt</i> is appended to the package)
	(optional padding for platform specific alignment)
	argument 0
	(optional padding for platform specific alignment)
	argument 1
Appended strings	...
	1 byte: Index within the package to the location of associated argument
	Null terminated string
	...

**Warning:** If `:kconfig:CONFIG_MINIMAL_LIBC` is selected in combination with `:kconfig:CONFIG_CBPRINTF_NANO` formatting with C standard library functions like `printf` or `snprintf` is limited. Among other things the `%n` specifier, most format flags, precision control, and floating point are not supported.

## 7.12.2 API Reference

group cbprintf\_apis

### Defines

CBPRINTF\_PACKAGE\_ALIGNMENT

Required alignment of the buffer used for packaging.

CBPRINTF\_MUST\_RUNTIME\_PACKAGE(skip, ...)

Determine if string must be packaged in run time.

Static packaging can be applied if size of the package can be determined at compile time. In general, package size can be determined at compile time if there are no string arguments which might be copied into package body if they are considered transient.

### Parameters

- `skip` – number of read only string arguments in the parameter list. It shall be non-zero if there are known read only string arguments present in the string (e.g. function name prefix in the log message).
- ... – String with arguments.

### Return values

- 1 – if string must be packaged in run time.
- 0 – string can be statically packaged.

CBPRINTF\_STATIC\_PACKAGE(packaged, inlen, outlen, align\_offset, flags, ...)

Statically package string.

Build string package from formatted string. It assumes that formatted string is in the read only memory.

If `_Generic` is not supported then runtime packaging is performed.

#### Parameters

- `packaged` – pointer to where the packaged data can be stored. Pass a null pointer to skip packaging but still calculate the total space required. The data stored here is relocatable, that is it can be moved to another contiguous block of memory. It must be aligned to the size of the longest argument. It is recommended to use `CBPRINTF_PACKAGE_ALIGNMENT` for alignment.
- `inlen` – set to the number of bytes available at `packaged`. If `packaged` is `NULL` the value is ignored.
- `outlen` – variable updated to the number of bytes required to completely store the packed information. If input buffer was too small it is set to `-ENOSPC`.
- `align_offset` – input buffer alignment offset in bytes. Where offset 0 means that buffer is aligned to `CBPRINTF_PACKAGE_ALIGNMENT`. Xtensa requires that `packaged` is aligned to `CBPRINTF_PACKAGE_ALIGNMENT` so it must be multiply of `CBPRINTF_PACKAGE_ALIGNMENT` or 0.
- `flags` – option flags. See Package flags..
- ... – formatted string with arguments. Format string must be constant.

#### Typedefs

typedef int (\*cbprintf\_cb)()

Signature for a `cbprintf` callback function.

This function expects two parameters:

- `c` a character to output. The output behavior should be as if this was cast to an unsigned char.
- `ctx` a pointer to an object that provides context for the output operation.

The declaration does not specify the parameter types. This allows a function like `fputc` to be used without requiring all context pointers to be to a `FILE` object.

**Return** the value of `c` cast to an unsigned char then back to int, or a negative error code that will be returned from [cbprintf\(\)](#).

#### Functions

int cbprintf\_package(void \*packaged, size\_t len, uint32\_t flags, const char \*format, ...)

Capture state required to output formatted data later.

Like [cbprintf\(\)](#) but instead of processing the arguments and emitting the formatted results immediately all arguments are captured so this can be done in a different context, e.g. when the output function can block.

In addition to the values extracted from arguments this will ensure that copies are made of the necessary portions of any string parameters that are not confirmed to be stored in read-only memory (hence assumed to be safe to refer to directly later).

### Parameters

- `packaged` – pointer to where the packaged data can be stored. Pass a null pointer to store nothing but still calculate the total space required. The data stored here is relocatable, that is it can be moved to another contiguous block of memory. However, under condition that alignment is maintained. It must be aligned to at least the size of a pointer.
- `len` – this must be set to the number of bytes available at `packaged` if it is not null. If `packaged` is null then it indicates hypothetical buffer alignment offset in bytes compared to `CBPRINTF_PACKAGE_ALIGNMENT` alignment. Buffer alignment offset impacts returned size of the package. Xtensa requires that buffer is always aligned to `CBPRINTF_PACKAGE_ALIGNMENT` so it must be multiply of `CBPRINTF_PACKAGE_ALIGNMENT` or 0 when `packaged` is null.
- `flags` – option flags. See Package flags..
- `format` – a standard ISO C format string with characters and conversion specifications.
- `...` – arguments corresponding to the conversion specifications found within `format`.

### Return values

- `nonegative` – the number of bytes successfully stored at `packaged`. This will not exceed `len`.
- `-EINVAL` – if `format` is not acceptable
- `-EFAULT` – if `packaged` alignment is not acceptable
- `-ENOSPC` – if `packaged` was not null and the space required to store exceed `len`.

`int cbvprintf_package(void *packaged, size_t len, uint32_t flags, const char *format, va_list ap)`  
Capture state required to output formatted data later.

Like `cbprintf()` but instead of processing the arguments and emitting the formatted results immediately all arguments are captured so this can be done in a different context, e.g. when the output function can block.

In addition to the values extracted from arguments this will ensure that copies are made of the necessary portions of any string parameters that are not confirmed to be stored in read-only memory (hence assumed to be safe to refer to directly later).

### Parameters

- `packaged` – pointer to where the packaged data can be stored. Pass a null pointer to store nothing but still calculate the total space required. The data stored here is relocatable, that is it can be moved to another contiguous block of memory. The pointer must be aligned to a multiple of the largest element in the argument list.
- `len` – this must be set to the number of bytes available at `packaged`. Ignored if `packaged` is NULL.
- `flags` – option flags. See Package flags..
- `format` – a standard ISO C format string with characters and conversion specifications.
- `ap` – captured stack arguments corresponding to the conversion specifications found within `format`.

### Return values

- `nonegative` – the number of bytes successfully stored at `packaged`. This will not exceed `len`.

- -EINVAL – if format is not acceptable
- -ENOSPC – if packaged was not null and the space required to store exceed len.

int cbprintf\_fsc\_package(void \*in\_packaged, size\_t in\_len, void \*packaged, size\_t len)

Convert package to fully self-contained (fsc) package.

By default, package does not contain read only strings. However, if needed it may be converted to a fully self-contained package which contains all strings. In order to allow such conversion, original package must be created with CBPRINTF\_PACKAGE\_ADD\_STRING\_IDXS flag. Such package will contain necessary data to find read only strings in the package and copy them into package body.

#### Parameters

- in\_packaged – pointer to original package created with CBPRINTF\_PACKAGE\_ADD\_STRING\_IDXS.
- in\_len – in\_packaged length.
- packaged – pointer to location where fully self-contained version of the input package will be written. Pass a null pointer to calculate space required.
- len – must be set to the number of bytes available at packaged. Not used if packaged is null.

#### Return values

- nonegative – the number of bytes successfully stored at packaged. This will not exceed len. If packaged is null, calculated length.
- -ENOSPC – if packaged was not null and the space required to store exceed len.
- -EINVAL – if in\_packaged is null.

int cbpprintf([cbprintf\\_cb](#) out, void \*ctx, void \*packaged)

Generate the output for a previously captured format operation.

---

**Note:** Memory indicated by packaged will be modified in a non-destructive way, meaning that it could still be reused with this function again.

---

#### Parameters

- out – the function used to emit each generated character.
- ctx – context provided when invoking out
- packaged – the data required to generate the formatted output, as captured by [cbprintf\\_package\(\)](#) or [cbvprintf\\_package\(\)](#). The alignment requirement on this data is the same as when it was initially created.

**Returns** the number of characters printed, or a negative error value returned from invoking out.

int cbprintf([cbprintf\\_cb](#) out, void \*ctx, const char \*format, ...)

\*printf-like output through a callback.

This is essentially printf() except the output is generated character-by-character using the provided out function. This allows formatting text of unbounded length without incurring the cost of a temporary buffer.

All formatting specifiers of C99 are recognized, and most are supported if the functionality is enabled.

---

**Note:** The functionality of this function is significantly reduced when **:kconfig: `CONFIG\_CBPRINTF\_NANO`** is selected.

---

#### Parameters

- `out` – the function used to emit each generated character.
- `ctx` – context provided when invoking `out`
- `format` – a standard ISO C format string with characters and conversion specifications.
- `...` – arguments corresponding to the conversion specifications found within `format`.

**Returns** the number of characters printed, or a negative error value returned from invoking `out`.

`int cbvprintf(cbprintf\_cb out, void *ctx, const char *format, va_list ap)`  
varargs-aware \*printf-like output through a callback.

This is essentially `vsprintf()` except the output is generated character-by-character using the provided `out` function. This allows formatting text of unbounded length without incurring the cost of a temporary buffer.

---

**Note:** This function is available only when **:kconfig: `CONFIG\_CBPRINTF\_LIBC\_SUBSTS`** is selected.

---

---

**Note:** The functionality of this function is significantly reduced when **:kconfig: `CONFIG\_CBPRINTF\_NANO`** is selected.

---

#### Parameters

- `out` – the function used to emit each generated character.
- `ctx` – context provided when invoking `out`
- `format` – a standard ISO C format string with characters and conversion specifications.
- `ap` – a reference to the values to be converted.

**Returns** the number of characters generated, or a negative error value returned from invoking `out`.

`int fprintfcb(FILE *stream, const char *format, ...)`  
`fprintf` using Zephyrs `cbprintf` infrastructure.

return The number of characters printed.

---

**Note:** This function is available only when **:kconfig: `CONFIG\_CBPRINTF\_LIBC\_SUBSTS`** is selected.

---

---

**Note:** The functionality of this function is significantly reduced when **:kconfig: `CONFIG\_CBPRINTF\_NANO`** is selected.

---

#### Parameters

- `stream` – the stream to which the output should be written.
- `format` – a standard ISO C format string with characters and conversion specifications.
- `...` – arguments corresponding to the conversion specifications found within `format`.

`int vfprintfcb(FILE *stream, const char *format, va_list ap)`  
vfprintf using Zephyrs cbprintf infrastructure.

---

**Note:** This function is available only when **:kconfig: `CONFIG\_CBPRINTF\_LIBC\_SUBSTS`** is selected.

---

---

**Note:** The functionality of this function is significantly reduced when **:kconfig: `CONFIG\_CBPRINTF\_NANO`** is selected.

---

#### Parameters

- `stream` – the stream to which the output should be written.
- `format` – a standard ISO C format string with characters and conversion specifications.
- `ap` – a reference to the values to be converted.

**Returns** The number of characters printed.

`int printfcb(const char *format, ...)`  
printf using Zephyrs cbprintf infrastructure.

---

**Note:** This function is available only when **:kconfig: `CONFIG\_CBPRINTF\_LIBC\_SUBSTS`** is selected.

---

---

**Note:** The functionality of this function is significantly reduced when **:kconfig: `CONFIG\_CBPRINTF\_NANO`** is selected.

---

#### Parameters

- `format` – a standard ISO C format string with characters and conversion specifications.
- `...` – arguments corresponding to the conversion specifications found within `format`.

**Returns** The number of characters printed.

int vprintfcb(const char \*format, va\_list ap)  
vprintf using Zephyrs cbprintf infrastructure.

---

**Note:** This function is available only when `:kconfig: `CONFIG_CBPRINTF_LIBC_SUBSTS`` is selected.

---

---

**Note:** The functionality of this function is significantly reduced when `:kconfig: `CONFIG_CBPRINTF_NANO`` is selected.

---

#### Parameters

- `format` – a standard ISO C format string with characters and conversion specifications.
- `ap` – a reference to the values to be converted.

**Returns** The number of characters printed.

int snprintfcb(char \*str, size\_t size, const char \*format, ...)  
snprintf using Zephyrs cbprintf infrastructure.

---

**Note:** This function is available only when `:kconfig: `CONFIG_CBPRINTF_LIBC_SUBSTS`` is selected.

---

---

**Note:** The functionality of this function is significantly reduced when `:kconfig: `CONFIG_CBPRINTF_NANO`` is selected.

---

#### Parameters

- `str` – where the formatted content should be written
- `size` – maximum number of characters for the formatted output, including the terminating null byte.
- `format` – a standard ISO C format string with characters and conversion specifications.
- `...` – arguments corresponding to the conversion specifications found within `format`.

**Returns** The number of characters that would have been written to `str`, excluding the terminating null byte. This is greater than the number actually written if `size` is too small.

int vsnprintfcb(char \*str, size\_t size, const char \*format, va\_list ap)  
vsnprintf using Zephyrs cbprintf infrastructure.

---

**Note:** This function is available only when `:kconfig: `CONFIG_CBPRINTF_LIBC_SUBSTS`` is selected.

---

---

**Note:** The functionality of this function is significantly reduced when `:kconfig: `CONFIG_CBPRINTF_NANO`` is selected.

---

**Parameters**

- `str` – where the formatted content should be written
- `size` – maximum number of characters for the formatted output, including the terminating null byte.
- `format` – a standard ISO C format string with characters and conversion specifications.
- `ap` – a reference to the values to be converted.

**Returns** The number of characters that would have been written to `str`, excluding the terminating null byte. This is greater than the number actually written if `size` is too small.

## 7.13 Kernel Services

The Zephyr kernel lies at the heart of every Zephyr application. It provides a low footprint, high performance, multi-threaded execution environment with a rich set of available features. The rest of the Zephyr ecosystem, including device drivers, networking stack, and application-specific code, uses the kernel's features to create a complete application.

The configurable nature of the kernel allows you to incorporate only those features needed by your application, making it ideal for systems with limited amounts of memory (as little as 2 KB!) or with simple multi-threading requirements (such as a set of interrupt handlers and a single background task). Examples of such systems include: embedded sensor hubs, environmental sensors, simple LED wearable, and store inventory tags.

Applications requiring more memory (50 to 900 KB), multiple communication devices (like Wi-Fi and Bluetooth Low Energy), and complex multi-threading, can also be developed using the Zephyr kernel. Examples of such systems include: fitness wearables, smart watches, and IoT wireless gateways.

### 7.13.1 Scheduling, Interrupts, and Synchronization

These pages cover basic kernel services related to thread scheduling and synchronization.

#### Threads

---

**Note:** There is also limited support for using [Zephyr Without Threads](#).

This section describes kernel services for creating, scheduling, and deleting independently executable threads of instructions.

A *thread* is a kernel object that is used for application processing that is too lengthy or too complex to be performed by an ISR.

Any number of threads can be defined by an application (limited only by available RAM). Each thread is referenced by a *thread id* that is assigned when the thread is spawned.

A thread has the following key properties:

- A **stack area**, which is a region of memory used for the thread's stack. The **size** of the stack area can be tailored to conform to the actual needs of the thread's processing. Special macros exist to create and work with stack memory regions.
- A **thread control block** for private kernel bookkeeping of the thread's metadata. This is an instance of type `k_thread`.
- An **entry point function**, which is invoked when the thread is started. Up to 3 **argument values** can be passed to this function.
- A **scheduling priority**, which instructs the kernel's scheduler how to allocate CPU time to the thread. (See [Scheduling](#).)
- A set of **thread options**, which allow the thread to receive special treatment by the kernel under specific circumstances. (See [Thread Options](#).)
- A **start delay**, which specifies how long the kernel should wait before starting the thread.
- An **execution mode**, which can either be supervisor or user mode. By default, threads run in supervisor mode and allow access to privileged CPU instructions, the entire memory address space, and peripherals. User mode threads have a reduced set of privileges. This depends on the **:kconfig: `CONFIG\_USERSPACE`** option. See [User Mode](#).

## Lifecycle

**Thread Creation** A thread must be created before it can be used. The kernel initializes the thread control block as well as one end of the stack portion. The remainder of the thread's stack is typically left uninitialized.

Specifying a start delay of `K_NO_WAIT` instructs the kernel to start thread execution immediately. Alternatively, the kernel can be instructed to delay execution of the thread by specifying a timeout value – for example, to allow device hardware used by the thread to become available.

The kernel allows a delayed start to be canceled before the thread begins executing. A cancellation request has no effect if the thread has already started. A thread whose delayed start was successfully canceled must be re-spawned before it can be used.

**Thread Termination** Once a thread is started it typically executes forever. However, a thread may synchronously end its execution by returning from its entry point function. This is known as **termination**.

A thread that terminates is responsible for releasing any shared resources it may own (such as mutexes and dynamically allocated memory) prior to returning, since the kernel does *not* reclaim them automatically.

In some cases a thread may want to sleep until another thread terminates. This can be accomplished with the `k_thread_join()` API. This will block the calling thread until either the timeout expires, the target thread self-exits, or the target thread aborts (either due to a `k_thread_abort()` call or triggering a fatal error).

Once a thread has terminated, the kernel guarantees that no use will be made of the thread struct. The memory of such a struct can then be re-used for any purpose, including spawning a new thread. Note that the thread must be fully terminated, which presents race conditions where a thread's own logic signals completion which is seen by another thread before the kernel processing is complete. Under normal circumstances, application code should use `k_thread_join()` or `k_thread_abort()` to synchronize on thread termination state and not rely on signaling from within application logic.

**Thread Aborting** A thread may asynchronously end its execution by **aborting**. The kernel automatically aborts a thread if the thread triggers a fatal error condition, such as dereferencing a null pointer.

A thread can also be aborted by another thread (or by itself) by calling `k_thread_abort()`. However, it is typically preferable to signal a thread to terminate itself gracefully, rather than aborting it.

As with thread termination, the kernel does not reclaim shared resources owned by an aborted thread.

---

**Note:** The kernel does not currently make any claims regarding an application's ability to respawn a thread that aborts.

---

**Thread Suspension** A thread can be prevented from executing for an indefinite period of time if it becomes **suspended**. The function `k_thread_suspend()` can be used to suspend any thread, including the calling thread. Suspending a thread that is already suspended has no additional effect.

Once suspended, a thread cannot be scheduled until another thread calls `k_thread_resume()` to remove the suspension.

---

**Note:** A thread can prevent itself from executing for a specified period of time using `k_sleep()`. However, this is different from suspending a thread since a sleeping thread becomes executable automatically when the time limit is reached.

---

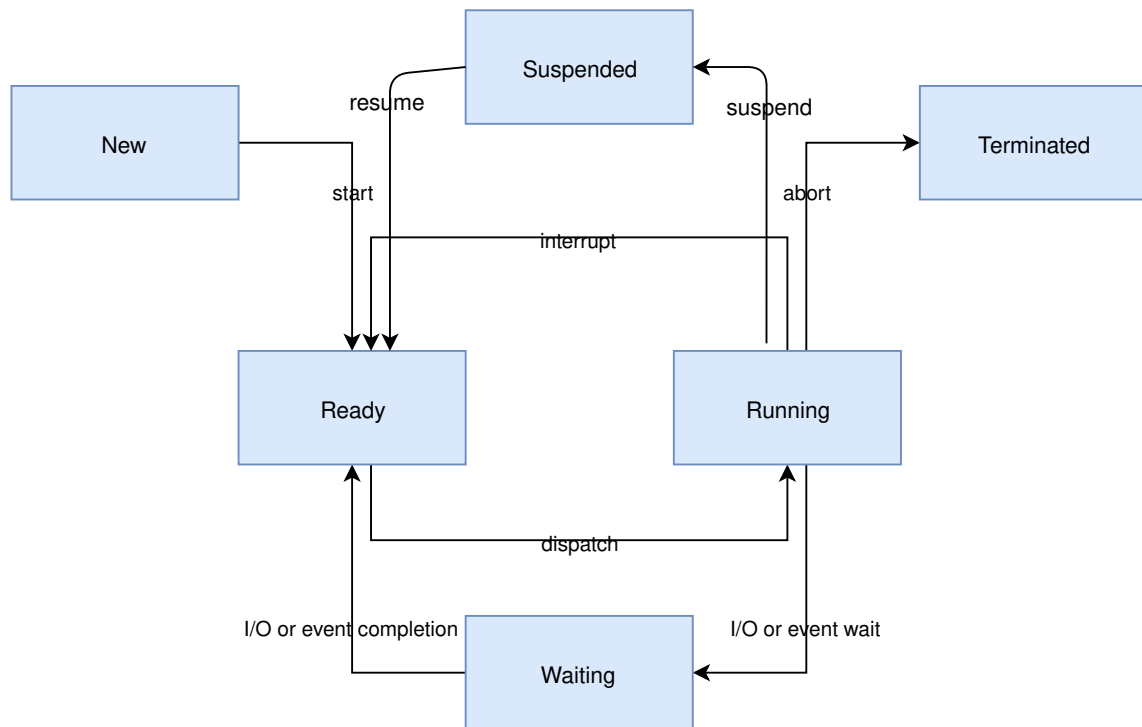

**Thread States** A thread that has no factors that prevent its execution is deemed to be **ready**, and is eligible to be selected as the current thread.

A thread that has one or more factors that prevent its execution is deemed to be **unready**, and cannot be selected as the current thread.

The following factors make a thread unready:

- The thread has not been started.
- The thread is waiting for a kernel object to complete an operation. (For example, the thread is taking a semaphore that is unavailable.)

- The thread is waiting for a timeout to occur.
- The thread has been suspended.
- The thread has terminated or aborted.

**Thread Stack objects** Every thread requires its own stack buffer for the CPU to push context. Depending on configuration, there are several constraints that must be met:

- There may need to be additional memory reserved for memory management structures
- If guard-based stack overflow detection is enabled, a small write-protected memory management region must immediately precede the stack buffer to catch overflows.
- If userspace is enabled, a separate fixed-size privilege elevation stack must be reserved to serve as a private kernel stack for handling system calls.
- If userspace is enabled, the thread's stack buffer must be appropriately sized and aligned such that a memory protection region may be programmed to exactly fit.

The alignment constraints can be quite restrictive, for example some MPUs require their regions to be of some power of two in size, and aligned to its own size.

Because of this, portable code can't simply pass an arbitrary character buffer to `k_thread_create()`. Special macros exist to instantiate stacks, prefixed with `K_KERNEL_STACK` and `K_THREAD_STACK`.

**Kernel-only Stacks** If it is known that a thread will never run in user mode, or the stack is being used for special contexts like handling interrupts, it is best to define stacks using the `K_KERNEL_STACK` macros.

These stacks save memory because an MPU region will never need to be programmed to cover the stack buffer itself, and the kernel will not need to reserve additional room for the privilege elevation stack, or memory management data structures which only pertain to user mode threads.

Attempts from user mode to use stacks declared in this way will result in a fatal error for the caller.

If `CONFIG_USERSPACE` is not enabled, the set of `K_THREAD_STACK` macros have an identical effect to the `K_KERNEL_STACK` macros.

**Thread stacks** If it is known that a stack will need to host user threads, or if this cannot be determined, define the stack with `K_THREAD_STACK` macros. This may use more memory but the stack object is suitable for hosting user threads.

If `CONFIG_USERSPACE` is not enabled, the set of `K_THREAD_STACK` macros have an identical effect to the `K_KERNEL_STACK` macros.

**Thread Priorities** A thread's priority is an integer value, and can be either negative or non-negative. Numerically lower priorities takes precedence over numerically higher values. For example, the scheduler gives thread A of priority 4 *higher* priority over thread B of priority 7; likewise thread C of priority -2 has higher priority than both thread A and thread B.

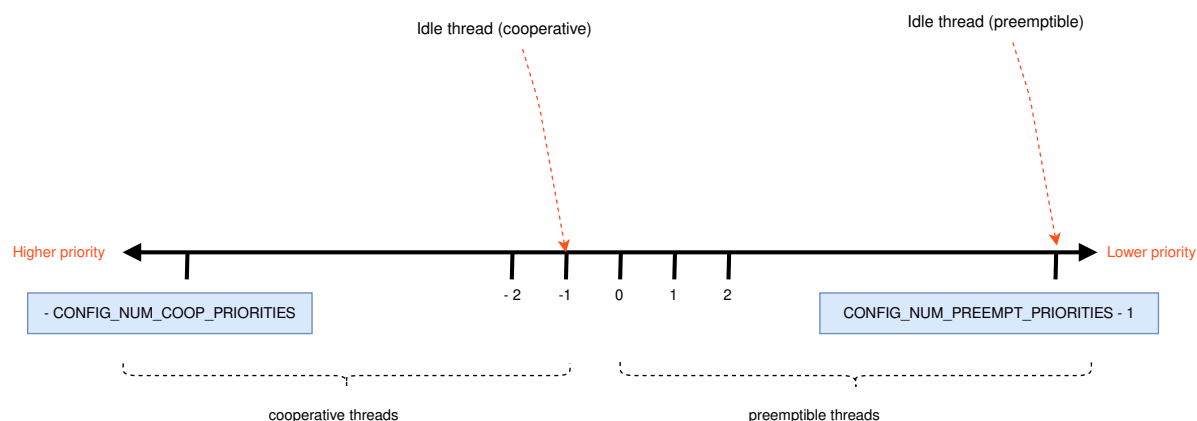

The scheduler distinguishes between two classes of threads, based on each thread's priority.

- A *cooperative thread* has a negative priority value. Once it becomes the current thread, a cooperative thread remains the current thread until it performs an action that makes it unready.
- A *preemptible thread* has a non-negative priority value. Once it becomes the current thread, a preemptible thread may be supplanted at any time if a cooperative thread, or a preemptible thread of higher or equal priority, becomes ready.

A thread's initial priority value can be altered up or down after the thread has been started. Thus it is possible for a preemptible thread to become a cooperative thread, and vice versa, by changing its priority.

The kernel supports a virtually unlimited number of thread priority levels. The configuration options `:kconfig: `CONFIG_NUM_COOP_PRIORITIES`` and `:kconfig: `CONFIG_NUM_PREEMPT_PRIORITIES`` specify the number of priority levels for each class of thread, resulting in the following usable priority ranges:

- cooperative threads: (`:kconfig: `CONFIG_NUM_COOP_PRIORITIES``) to -1
- preemptive threads: 0 to (`:kconfig: `CONFIG_NUM_PREEMPT_PRIORITIES`` - 1)

For example, configuring 5 cooperative priorities and 10 preemptive priorities results in the ranges -5 to -1 and 0 to 9, respectively.

**Meta-IRQ Priorities** When enabled (see `:kconfig: `CONFIG_NUM_METAIRQ_PRIORITIES``), there is a special subclass of cooperative priorities at the highest (numerically lowest) end of the priority space: meta-IRQ threads. These are scheduled according to their normal priority, but also have the special ability to preempt all other threads (and other meta-irq threads) at lower priorities, even if those threads are cooperative and/or have taken a scheduler lock.

This behavior makes the act of unblocking a meta-IRQ thread (by any means, e.g. creating it, calling `k_sem_give()`, etc.) into the equivalent of a synchronous system call when done by a lower priority thread, or an ARM-like “pended IRQ” when done from true interrupt context. The intent is that this feature will be used to implement interrupt “bottom half” processing and/or “tasklet” features in driver subsystems. The thread, once woken, will be guaranteed to run before the current CPU returns into application code.

Unlike similar features in other OSes, meta-IRQ threads are true threads and run on their own stack (which must be allocated normally), not the per-CPU interrupt stack. Design work to enable the use of the IRQ stack on supported architectures is pending.

Note that because this breaks the promise made to cooperative threads by the Zephyr API (namely that the OS won't schedule other thread until the current thread deliberately blocks), it should be used only with great care from application code. These are not simply very high priority threads and should not be used as such.

**Thread Options** The kernel supports a small set of *thread options* that allow a thread to receive special treatment under specific circumstances. The set of options associated with a thread are specified when the thread is spawned.

A thread that does not require any thread option has an option value of zero. A thread that requires a thread option specifies it by name, using the `|` character as a separator if multiple options are needed (i.e. combine options using the bitwise OR operator).

The following thread options are supported.

**K\_ESSENTIAL** This option tags the thread as an *essential thread*. This instructs the kernel to treat the termination or aborting of the thread as a fatal system error.

By default, the thread is not considered to be an essential thread.

**K\_SSE\_REGS** This x86-specific option indicate that the thread uses the CPU's SSE registers. Also see [K\\_FP\\_REGS](#).

By default, the kernel does not attempt to save and restore the contents of this register when scheduling the thread.

**K\_FP\_REGS** This option indicate that the thread uses the CPU's floating point registers. This instructs the kernel to take additional steps to save and restore the contents of these registers when scheduling the thread. (For more information see [Floating Point Services](#).)

By default, the kernel does not attempt to save and restore the contents of this register when scheduling the thread.

**K\_USER** If `:kconfig: `CONFIG_USERSPACE`` is enabled, this thread will be created in user mode and will have reduced privileges. See [User Mode](#). Otherwise this flag does nothing.

**K\_INHERIT\_PERMS** If `:kconfig: `CONFIG_USERSPACE`` is enabled, this thread will inherit all kernel object permissions that the parent thread had, except the parent thread object. See [User Mode](#).

**Thread Custom Data** Every thread has a 32-bit *custom data* area, accessible only by the thread itself, and may be used by the application for any purpose it chooses. The default custom data value for a thread is zero.

---

**Note:** Custom data support is not available to ISRs because they operate within a single shared kernel interrupt handling context.

---

By default, thread custom data support is disabled. The configuration option `:kconfig: `CONFIG_THREAD_CUSTOM_DATA`` can be used to enable support.

The `k_thread_custom_data_set()` and `k_thread_custom_data_get()` functions are used to write and read a thread's custom data, respectively. A thread can only access its own custom data, and not that of another thread.

The following code uses the custom data feature to record the number of times each thread calls a specific routine.

**Note:** Obviously, only a single routine can use this technique, since it monopolizes the use of the custom data feature.

---

```
int call_tracking_routine(void)
{
    uint32_t call_count;

    if (k_is_in_isr()) {
        /* ignore any call made by an ISR */
    } else {
        call_count = (uint32_t)k_thread_custom_data_get();
        call_count++;
        k_thread_custom_data_set((void *)call_count);
    }

    /* do rest of routine's processing */
    ...
}
```

Use thread custom data to allow a routine to access thread-specific information, by using the custom data as a pointer to a data structure owned by the thread.

## Implementation

**Spawning a Thread** A thread is spawned by defining its stack area and its thread control block, and then calling `k_thread_create()`.

The stack area must be defined using `K_THREAD_STACK_DEFINE` or `K_KERNEL_STACK_DEFINE` to ensure it is properly set up in memory.

The size parameter for the stack must be one of three values:

- The original requested stack size passed to `K_THREAD_STACK` or `K_KERNEL_STACK` family of stack instantiation macros.
- For a stack object defined with the `K_THREAD_STACK` family of macros, the return value of `K_THREAD_STACK_SIZEOF()` for that object.
- For a stack object defined with the `K_KERNEL_STACK` family of macros, the return value of `K_KERNEL_STACK_SIZEOF()` for that object.

The thread spawning function returns its thread id, which can be used to reference the thread.

The following code spawns a thread that starts immediately.

```
#define MY_STACK_SIZE 500
#define MY_PRIORITY 5

extern void my_entry_point(void *, void *, void *);

K_THREAD_STACK_DEFINE(my_stack_area, MY_STACK_SIZE);
struct k_thread my_thread_data;

k_tid_t my_tid = k_thread_create(&my_thread_data, my_stack_area,
                                K_THREAD_STACK_SIZEOF(my_stack_area),
                                my_entry_point,
                                NULL, NULL, NULL,
                                MY_PRIORITY, 0, K_NO_WAIT);
```

Alternatively, a thread can be declared at compile time by calling `K_THREAD_DEFINE`. Observe that the macro defines the stack area, control block, and thread id variables automatically.

The following code has the same effect as the code segment above.

```
#define MY_STACK_SIZE 500
#define MY_PRIORITY 5

extern void my_entry_point(void *, void *, void *);

K_THREAD_DEFINE(my_tid, MY_STACK_SIZE,
                my_entry_point, NULL, NULL, NULL,
                MY_PRIORITY, 0, 0);
```

**Note:** The delay parameter to `k_thread_create()` is a `k_timeout_t` value, so `K_NO_WAIT` means to start the thread immediately. The corresponding parameter to `K_THREAD_DEFINE` is a duration in integral milliseconds, so the equivalent argument is 0.

**User Mode Constraints** This section only applies if `:kconfig: `CONFIG_USERSPACE`` is enabled, and a user thread tries to create a new thread. The `k_thread_create()` API is still used, but there are additional constraints which must be met or the calling thread will be terminated:

- The calling thread must have permissions granted on both the child thread and stack parameters; both are tracked by the kernel as kernel objects.
- The child thread and stack objects must be in an uninitialized state, i.e. it is not currently running and the stack memory is unused.
- The stack size parameter passed in must be equal to or less than the bounds of the stack object when it was declared.
- The `K_USER` option must be used, as user threads can only create other user threads.
- The `K_ESSENTIAL` option must not be used, user threads may not be considered essential threads.
- The priority of the child thread must be a valid priority value, and equal to or lower than the parent thread.

**Dropping Permissions** If `:kconfig: `CONFIG_USERSPACE`` is enabled, a thread running in supervisor mode may perform a one-way transition to user mode using the `k_thread_user_mode_enter()` API. This is a one-way operation which will reset and zero the thread's stack memory. The thread will be marked as non-essential.

**Terminating a Thread** A thread terminates itself by returning from its entry point function.

The following code illustrates the ways a thread can terminate.

```
void my_entry_point(int unused1, int unused2, int unused3)
{
    while (1) {
        ...
        if (<some condition>) {
            return; /* thread terminates from mid-entry point function */
        }
        ...
    }
}
```

(continues on next page)

(continued from previous page)

```
/* thread terminates at end of entry point function */
}
```

If `:kconfig: `CONFIG_USERSPACE`` is enabled, aborting a thread will additionally mark the thread and stack objects as uninitialized so that they may be re-used.

**Runtime Statistics** Thread runtime statistics can be gathered and retrieved if `:kconfig: `CONFIG_THREAD_RUNTIME_STATS`` is enabled, for example, total number of execution cycles of a thread.

By default, the runtime statistics are gathered using the default kernel timer. For some architectures, SoCs or boards, there are timers with higher resolution available via timing functions. Using of these timers can be enabled via `:kconfig: `CONFIG_THREAD_RUNTIME_STATS_USE_TIMING_FUNCTIONS``.

Here is an example:

```
k_thread_runtime_stats_t rt_stats_thread;

k_thread_runtime_stats_get(k_current_get(), &rt_stats_thread);

printf("Cycles: %llu\n", rt_stats_thread.execution_cycles);
```

**Suggested Uses** Use threads to handle processing that cannot be handled in an ISR.

Use separate threads to handle logically distinct processing operations that can execute in parallel.

**Configuration Options** Related configuration options:

- `:kconfig: `CONFIG_MAIN_THREAD_PRIORITY``
- `:kconfig: `CONFIG_MAIN_STACK_SIZE``
- `:kconfig: `CONFIG_IDLE_STACK_SIZE``
- `:kconfig: `CONFIG_THREAD_CUSTOM_DATA``
- `:kconfig: `CONFIG_NUM_COOP_PRIORITIES``
- `:kconfig: `CONFIG_NUM_PREEMPT_PRIORITIES``
- `:kconfig: `CONFIG_TIMESLICING``
- `:kconfig: `CONFIG_TIMESLICE_SIZE``
- `:kconfig: `CONFIG_TIMESLICE_PRIORITY``
- `:kconfig: `CONFIG_USERSPACE``

## API Reference

group thread\_apis

### Defines

K\_ESSENTIAL

system thread that must not abort

**K\_FP\_REGS**

FPU registers are managed by context switch.

This option indicates that the thread uses the CPU's floating point registers. This instructs the kernel to take additional steps to save and restore the contents of these registers when scheduling the thread. No effect if `:kconfig: `CONFIG_FPU_SHARING`` is not enabled.

**K\_USER**

user mode thread

This thread has dropped from supervisor mode to user mode and consequently has additional restrictions

**K\_INHERIT\_PERMS**

Inherit Permissions.

Indicates that the thread being created should inherit all kernel object permissions from the thread that created it. No effect if `:kconfig: `CONFIG_USERSPACE`` is not enabled.

**K\_CALLBACK\_STATE**

Callback item state.

This is a single bit of state reserved for “callback manager” utilities (p4wq initially) who need to track operations invoked from within a user-provided callback they have been invoked. Effectively it serves as a tiny bit of zero-overhead TLS data.

**k\_thread\_access\_grant(thread, ...)**

Grant a thread access to a set of kernel objects.

This is a convenience function. For the provided thread, grant access to the remaining arguments, which must be pointers to kernel objects.

The thread object must be initialized (i.e. running). The objects don't need to be. Note that NULL shouldn't be passed as an argument.

**Parameters**

- `thread` – Thread to grant access to objects
- `...` – list of kernel object pointers

**K\_THREAD\_DEFINE(name, stack\_size, entry, p1, p2, p3, prio, options, delay)**

Statically define and initialize a thread.

The thread may be scheduled for immediate execution or a delayed start.

Thread options are architecture-specific, and can include `K_ESSENTIAL`, `K_FP_REGS`, and `K_SSE_REGS`. Multiple options may be specified by separating them using “|” (the logical OR operator).

The ID of the thread can be accessed using:

```
extern const k_tid_t <name>;
```

**Parameters**

- `name` – Name of the thread.
- `stack_size` – Stack size in bytes.
- `entry` – Thread entry function.

- `p1` – 1st entry point parameter.
- `p2` – 2nd entry point parameter.
- `p3` – 3rd entry point parameter.
- `prio` – Thread priority.
- `options` – Thread options.
- `delay` – Scheduling delay (in milliseconds), zero for no delay.

## Typedefs

```
typedef void (*k_thread_user_cb_t)(const struct k_thread *thread, void *user_data)
```

## Functions

```
void k_thread_foreach(k_thread_user_cb_t user_cb, void *user_data)
```

Iterate over all the threads in the system.

This routine iterates over all the threads in the system and calls the `user_cb` function for each thread.

---

**Note:** `:kconfig: `CONFIG_THREAD_MONITOR`` must be set for this function to be effective.

---

---

**Note:** This API uses `k_spin_lock` to protect the `_kernel.threads` list which means creation of new threads and terminations of existing threads are blocked until this API returns.

---

### Parameters

- `user_cb` – Pointer to the user callback function.
- `user_data` – Pointer to user data.

**Returns** N/A

```
void k_thread_foreach_unlocked(k_thread_user_cb_t user_cb, void *user_data)
```

Iterate over all the threads in the system without locking.

This routine works exactly the same like *k\_thread\_foreach* but unlocks interrupts when `user_cb` is executed.

---

**Note:** `:kconfig: `CONFIG_THREAD_MONITOR`` must be set for this function to be effective.

---

---

**Note:** This API uses `k_spin_lock` only when accessing the `_kernel.threads` queue elements. It unlocks it during user callback function processing. If a new task is created when this `foreach` function is in progress, the added new task would not be included in the enumeration. If a task is aborted during this enumeration, there would be a race here and there is a possibility that this aborted task would be included in the enumeration.

---

---

**Note:** If the task is aborted and the memory occupied by its *k\_thread* structure is reused when this `k_thread_foreach_unlocked` is in progress it might even lead to the system behave

---

unstable. This function may never return, as it would follow some next task pointers treating given pointer as a pointer to the `k_thread` structure while it is something different right now. Do not reuse the memory that was occupied by `k_thread` structure of aborted task if it was aborted after this function was called in any context.

---

### Parameters

- `user_cb` – Pointer to the user callback function.
- `user_data` – Pointer to user data.

```
k_tid_t k_thread_create(struct k_thread *new_thread, k_thread_stack_t *stack, size_t
                        stack_size, k_thread_entry_t entry, void *p1, void *p2, void *p3, int
                        prio, uint32_t options, k_timeout_t delay)
```

Create a thread.

This routine initializes a thread, then schedules it for execution.

The new thread may be scheduled for immediate execution or a delayed start. If the newly spawned thread does not have a delayed start the kernel scheduler may preempt the current thread to allow the new thread to execute.

Thread options are architecture-specific, and can include `K_ESSENTIAL`, `K_FP_REGS`, and `K_SSE_REGS`. Multiple options may be specified by separating them using “|” (the logical OR operator).

Stack objects passed to this function must be originally defined with either of these macros in order to be portable:

- `K_THREAD_STACK_DEFINE()` - For stacks that may support either user or supervisor threads.
- `K_KERNEL_STACK_DEFINE()` - For stacks that may support supervisor threads only. These stacks use less memory if `CONFIG_USERSPACE` is enabled.

The `stack_size` parameter has constraints. It must either be:

- The original size value passed to `K_THREAD_STACK_DEFINE()` or `K_KERNEL_STACK_DEFINE()`
- The return value of `K_THREAD_STACK_SIZEOF(stack)` if the stack was defined with `K_THREAD_STACK_DEFINE()`
- The return value of `K_KERNEL_STACK_SIZEOF(stack)` if the stack was defined with `K_KERNEL_STACK_DEFINE()`.

Using other values, or `sizeof(stack)` may produce undefined behavior.

### Parameters

- `new_thread` – Pointer to uninitialized struct `k_thread`
- `stack` – Pointer to the stack space.
- `stack_size` – Stack size in bytes.
- `entry` – Thread entry function.
- `p1` – 1st entry point parameter.
- `p2` – 2nd entry point parameter.
- `p3` – 3rd entry point parameter.
- `prio` – Thread priority.

- options – Thread options.
- delay – Scheduling delay, or K\_NO\_WAIT (for no delay).

**Returns** ID of new thread.

```
FUNC_NORETURN void k_thread_user_mode_enter(k_thread_entry_t entry, void *p1, void *p2, void *p3)
```

Drop a thread's privileges permanently to user mode.

This allows a supervisor thread to be re-used as a user thread. This function does not return, but control will transfer to the provided entry point as if this was a new user thread.

The implementation ensures that the stack buffer contents are erased. Any thread-local storage will be reverted to a pristine state.

Memory domain membership, resource pool assignment, kernel object permissions, priority, and thread options are preserved.

A common use of this function is to re-use the main thread as a user thread once all supervisor mode-only tasks have been completed.

#### Parameters

- entry – Function to start executing from
- p1 – 1st entry point parameter
- p2 – 2nd entry point parameter
- p3 – 3rd entry point parameter

```
static inline void k_thread_heap_assign(struct k_thread *thread, struct k_heap *heap)
```

Assign a resource memory pool to a thread.

By default, threads have no resource pool assigned unless their parent thread has a resource pool, in which case it is inherited. Multiple threads may be assigned to the same memory pool.

Changing a thread's resource pool will not migrate allocations from the previous pool.

#### Parameters

- thread – Target thread to assign a memory pool for resource requests.
- heap – Heap object to use for resources, or NULL if the thread should no longer have a memory pool.

```
void k_thread_system_pool_assign(struct k_thread *thread)
```

Assign the system heap as a thread's resource pool.

Similar to `z_thread_heap_assign()`, but the thread will use the kernel heap to draw memory.

Use with caution, as a malicious thread could perform DoS attacks on the kernel heap.

#### Parameters

- thread – Target thread to assign the system heap for resource requests

```
int k_thread_join(struct k_thread *thread, k_timeout_t timeout)
```

Sleep until a thread exits.

The caller will be put to sleep until the target thread exits, either due to being aborted, self-exiting, or taking a fatal error. This API returns immediately if the thread isn't running.

This API may only be called from ISRs with a K\_NO\_WAIT timeout, where it can be useful as a predicate to detect when a thread has aborted.

#### Parameters

- thread – Thread to wait to exit

- `timeout` – upper bound time to wait for the thread to exit.

**Return values**

- 0 – success, target thread has exited or wasn't running
- `-EBUSY` – returned without waiting
- `-EAGAIN` – waiting period timed out
- `-EDEADLK` – target thread is joining on the caller, or target thread is the caller

`int32_t k_sleep(k_timeout_t timeout)`

Put the current thread to sleep.

This routine puts the current thread to sleep for *duration*, specified as a `k_timeout_t` object.

---

**Note:** if *timeout* is set to `K_FOREVER` then the thread is suspended.

---

**Parameters**

- `timeout` – Desired duration of sleep.

**Returns** Zero if the requested time has elapsed or the number of milliseconds left to sleep, if thread was woken up by `k_wakeup` call.

`static inline int32_t k_msleep(int32_t ms)`

Put the current thread to sleep.

This routine puts the current thread to sleep for *duration* milliseconds.

**Parameters**

- `ms` – Number of milliseconds to sleep.

**Returns** Zero if the requested time has elapsed or the number of milliseconds left to sleep, if thread was woken up by `k_wakeup` call.

`int32_t k_usleep(int32_t us)`

Put the current thread to sleep with microsecond resolution.

This function is unlikely to work as expected without kernel tuning. In particular, because the lower bound on the duration of a sleep is the duration of a tick, **:kconfig: `CONFIG_SYS_CLOCK_TICKS_PER_SEC`** must be adjusted to achieve the resolution desired. The implications of doing this must be understood before attempting to use `k_usleep()`. Use with caution.

**Parameters**

- `us` – Number of microseconds to sleep.

**Returns** Zero if the requested time has elapsed or the number of microseconds left to sleep, if thread was woken up by `k_wakeup` call.

`void k_busy_wait(uint32_t usec_to_wait)`

Cause the current thread to busy wait.

This routine causes the current thread to execute a “do nothing” loop for *usec\_to\_wait* microseconds.

---

**Note:** The clock used for the microsecond-resolution delay here may be skewed relative to the clock used for system timeouts like `k_sleep()`. For example `k_busy_wait(1000)` may take slightly more or less time than `k_sleep(K_MSEC(1))`, with the offset dependent on clock tolerances.

---

**Returns** N/A

`void k_yield(void)`

Yield the current thread.

This routine causes the current thread to yield execution to another thread of the same or higher priority. If there are no other ready threads of the same or higher priority, the routine returns immediately.

**Returns** N/A

`void k_wakeup(k_tid_t thread)`

Wake up a sleeping thread.

This routine prematurely wakes up *thread* from sleeping.

If *thread* is not currently sleeping, the routine has no effect.

**Parameters**

- *thread* – ID of thread to wake.

**Returns** N/A

`__attribute__((const)) static inline k_tid_t k_current_get(void)`

Get thread ID of the current thread.

**Returns** ID of current thread.

`void k_thread_abort(k_tid_t thread)`

Abort a thread.

This routine permanently stops execution of *thread*. The thread is taken off all kernel queues it is part of (i.e. the ready queue, the timeout queue, or a kernel object wait queue). However, any kernel resources the thread might currently own (such as mutexes or memory blocks) are not released. It is the responsibility of the caller of this routine to ensure all necessary cleanup is performed.

After `k_thread_abort()` returns, the thread is guaranteed not to be running or to become runnable anywhere on the system. Normally this is done via blocking the caller (in the same manner as `k_thread_join()`), but in interrupt context on SMP systems the implementation is required to spin for threads that are running on other CPUs. Note that as specified, this means that on SMP platforms it is possible for application code to create a deadlock condition by simultaneously aborting a cycle of threads using at least one termination from interrupt context. Zephyr cannot detect all such conditions.

**Parameters**

- *thread* – ID of thread to abort.

**Returns** N/A

`void k_thread_start(k_tid_t thread)`

Start an inactive thread.

If a thread was created with `K_FOREVER` in the delay parameter, it will not be added to the scheduling queue until this function is called on it.

**Parameters**

- *thread* – thread to start

`k_ticks_t k_thread_timeout_expires_ticks(const struct k_thread *t)`

Get time when a thread wakes up, in system ticks.

This routine computes the system uptime when a waiting thread next executes, in units of system ticks. If the thread is not waiting, it returns current system time.

`k_ticks_t k_thread_timeout_remaining_ticks(const struct k\_thread *t)`

Get time remaining before a thread wakes up, in system ticks.

This routine computes the time remaining before a waiting thread next executes, in units of system ticks. If the thread is not waiting, it returns zero.

`int k_thread_priority_get(k_tid_t thread)`

Get a thread's priority.

This routine gets the priority of *thread*.

#### Parameters

- *thread* – ID of thread whose priority is needed.

**Returns** Priority of *thread*.

`void k_thread_priority_set(k_tid_t thread, int prio)`

Set a thread's priority.

This routine immediately changes the priority of *thread*.

Rescheduling can occur immediately depending on the priority *thread* is set to:

- If its priority is raised above the priority of the caller of this function, and the caller is preemptible, *thread* will be scheduled in.
- If the caller operates on itself, it lowers its priority below that of other threads in the system, and the caller is preemptible, the thread of highest priority will be scheduled in.

Priority can be assigned in the range of `-CONFIG_NUM_COOP_PRIORITIES` to `CONFIG_NUM_PREEMPT_PRIORITIES-1`, where `-CONFIG_NUM_COOP_PRIORITIES` is the highest priority.

**Warning:** Changing the priority of a thread currently involved in mutex priority inheritance may result in undefined behavior.

#### Parameters

- *thread* – ID of thread whose priority is to be set.
- *prio* – New priority.

**Returns** N/A

`void k_thread_deadline_set(k_tid_t thread, int deadline)`

Set deadline expiration time for scheduler.

This sets the “deadline” expiration as a time delta from the current time, in the same units used by [k\\_cycle\\_get\\_32\(\)](#). The scheduler (when deadline scheduling is enabled) will choose the next expiring thread when selecting between threads at the same static priority. Threads at different priorities will be scheduled according to their static priority.

---

**Note:** Deadlines are stored internally using 32 bit unsigned integers. The number of cycles between the “first” deadline in the scheduler queue and the “last” deadline must be less than  $2^{31}$  (i.e a signed non-negative quantity). Failure to adhere to this rule may result in scheduled threads running in an incorrect deadline order.

---

---

**Note:** Despite the API naming, the scheduler makes no guarantees the thread WILL be scheduled within that deadline, nor does it take extra metadata (like e.g. the “runtime” and

---

“period” parameters in Linux sched\_setattr()) that allows the kernel to validate the scheduling for achievability. Such features could be implemented above this call, which is simply input to the priority selection logic.

---

**Note:** You should enable `:kconfig: `CONFIG_SCHED_DEADLINE`` in your project configuration.

---

#### Parameters

- thread – A thread on which to set the deadline
- deadline – A time delta, in cycle units

```
int k_thread_cpu_mask_clear(k_tid_t thread)
```

Sets all CPU enable masks to zero.

After this returns, the thread will no longer be schedulable on any CPUs. The thread must not be currently runnable.

---

**Note:** You should enable `:kconfig: `CONFIG_SCHED_DEADLINE`` in your project configuration.

---

#### Parameters

- thread – Thread to operate upon

**Returns** Zero on success, otherwise error code

```
int k_thread_cpu_mask_enable_all(k_tid_t thread)
```

Sets all CPU enable masks to one.

After this returns, the thread will be schedulable on any CPU. The thread must not be currently runnable.

---

**Note:** You should enable `:kconfig: `CONFIG_SCHED_DEADLINE`` in your project configuration.

---

#### Parameters

- thread – Thread to operate upon

**Returns** Zero on success, otherwise error code

```
int k_thread_cpu_mask_enable(k_tid_t thread, int cpu)
```

Enable thread to run on specified CPU.

The thread must not be currently runnable.

---

**Note:** You should enable `:kconfig: `CONFIG_SCHED_DEADLINE`` in your project configuration.

---

#### Parameters

- thread – Thread to operate upon
- cpu – CPU index

**Returns** Zero on success, otherwise error code

```
int k_thread_cpu_mask_disable(k_tid_t thread, int cpu)
```

Prevent thread to run on specified CPU.

The thread must not be currently runnable.

---

**Note:** You should enable **:kconfig: `CONFIG\_SCHED\_DEADLINE`** in your project configuration.

---

#### Parameters

- `thread` – Thread to operate upon
- `cpu` – CPU index

**Returns** Zero on success, otherwise error code

```
void k_thread_suspend(k_tid_t thread)
```

Suspend a thread.

This routine prevents the kernel scheduler from making *thread* the current thread. All other internal operations on *thread* are still performed; for example, kernel objects it is waiting on are still handed to it. Note that any existing timeouts (e.g. `k_sleep()`, or a timeout argument to `k_sem_take()` et. al.) will be canceled. On resume, the thread will begin running immediately and return from the blocked call.

If *thread* is already suspended, the routine has no effect.

#### Parameters

- `thread` – ID of thread to suspend.

**Returns** N/A

```
void k_thread_resume(k_tid_t thread)
```

Resume a suspended thread.

This routine allows the kernel scheduler to make *thread* the current thread, when it is next eligible for that role.

If *thread* is not currently suspended, the routine has no effect.

#### Parameters

- `thread` – ID of thread to resume.

**Returns** N/A

```
void k_sched_time_slice_set(int32_t slice, int prio)
```

Set time-slicing period and scope.

This routine specifies how the scheduler will perform time slicing of preemptible threads.

To enable time slicing, *slice* must be non-zero. The scheduler ensures that no thread runs for more than the specified time limit before other threads of that priority are given a chance to execute. Any thread whose priority is higher than *prio* is exempted, and may execute as long as desired without being preempted due to time slicing.

Time slicing only limits the maximum amount of time a thread may continuously execute. Once the scheduler selects a thread for execution, there is no minimum guaranteed time the thread will execute before threads of greater or equal priority are scheduled.

When the current thread is the only one of that priority eligible for execution, this routine has no effect; the thread is immediately rescheduled after the slice period expires.

To disable timeslicing, set both *slice* and *prio* to zero.

**Parameters**

- *slice* – Maximum time slice length (in milliseconds).
- *prio* – Highest thread priority level eligible for time slicing.

**Returns** N/A

void `k_sched_lock(void)`

Lock the scheduler.

This routine prevents the current thread from being preempted by another thread by instructing the scheduler to treat it as a cooperative thread. If the thread subsequently performs an operation that makes it unready, it will be context switched out in the normal manner. When the thread again becomes the current thread, its non-preemptible status is maintained.

This routine can be called recursively.

---

**Note:** `k_sched_lock()` and `k_sched_unlock()` should normally be used when the operation being performed can be safely interrupted by ISRs. However, if the amount of processing involved is very small, better performance may be obtained by using `irq_lock()` and `irq_unlock()`.

---

**Returns** N/A

void `k_sched_unlock(void)`

Unlock the scheduler.

This routine reverses the effect of a previous call to `k_sched_lock()`. A thread must call the routine once for each time it called `k_sched_lock()` before the thread becomes preemptible.

**Returns** N/A

void `k_thread_custom_data_set(void *value)`

Set current thread's custom data.

This routine sets the custom data for the current thread to @ value.

Custom data is not used by the kernel itself, and is freely available for a thread to use as it sees fit. It can be used as a framework upon which to build thread-local storage.

**Parameters**

- *value* – New custom data value.

**Returns** N/A

void `*k_thread_custom_data_get(void)`

Get current thread's custom data.

This routine returns the custom data for the current thread.

**Returns** Current custom data value.

int `k_thread_name_set(k_tid_t thread, const char *str)`

Set current thread name.

Set the name of the thread to be used when `:kconfig: `CONFIG_THREAD_MONITOR`` is enabled for tracing and debugging.

**Parameters**

- *thread* – Thread to set name, or NULL to set the current thread
- *str* – Name string

**Return values**

- 0 – on success
- -EFAULT – Memory access error with supplied string
- -ENOSYS – Thread name configuration option not enabled
- -EINVAL – Thread name too long

```
const char *k_thread_name_get(k_tid_t thread)
```

Get thread name.

Get the name of a thread

**Parameters**

- thread – Thread ID

**Return values** Thread – name, or NULL if configuration not enabled

```
int k_thread_name_copy(k_tid_t thread, char *buf, size_t size)
```

Copy the thread name into a supplied buffer.

**Parameters**

- thread – Thread to obtain name information
- buf – Destination buffer
- size – Destination buffer size

**Return values**

- -ENOSPC – Destination buffer too small
- -EFAULT – Memory access error
- -ENOSYS – Thread name feature not enabled
- 0 – Success

```
const char *k_thread_state_str(k_tid_t thread_id)
```

Get thread state string.

Get the human friendly thread state string

**Parameters**

- thread\_id – Thread ID

**Return values** Thread – state string, empty if no state flag is set

```
struct k_thread
```

*#include <thread.h>* Thread Structure

**Public Members**

```
struct _callee_saved callee_saved
```

defined by the architecture, but all archs need these

```
void *init_data
```

static thread init data

`_wait_q_t join_queue`  
threads waiting in [k\\_thread\\_join\(\)](#)

`struct __thread_entry entry`  
thread entry and parameters description

`struct k_thread *next_thread`  
next item in list of all threads

`void *custom_data`  
crude thread-local storage

`struct _thread_stack_info stack_info`  
Stack Info

`struct _mem_domain_info mem_domain_info`  
memory domain info of the thread

`k_thread_stack_t *stack_obj`  
Base address of thread stack

`void *syscall_frame`  
current syscall frame pointer

`int swap_retval`  
`z_swap()` return value

`void *switch_handle`  
Context handle returned via [arch\\_switch\(\)](#)

`struct k_heap *resource_pool`  
resource pool

`struct _thread_arch arch`  
arch-specifics: must always be at the end

*group* `thread_stack_api`  
Thread Stack APIs.

## Defines

`K_KERNEL_STACK_ARRAY_EXTERN(sym, nmemb, size)`  
Obtain an extern reference to a stack array.

This macro properly brings the symbol of a stack array declared elsewhere into scope.

### Parameters

- `sym` – Thread stack symbol name
- `nmemb` – Number of stacks to declare

- `size` – Size of the stack memory region

`K_KERNEL_PINNED_STACK_ARRAY_EXTERN(sym, nmemb, size)`

Obtain an extern reference to a pinned stack array.

This macro properly brings the symbol of a pinned stack array declared elsewhere into scope.

#### Parameters

- `sym` – Thread stack symbol name
- `nmemb` – Number of stacks to declare
- `size` – Size of the stack memory region

`K_KERNEL_STACK_DEFINE(sym, size)`

Define a toplevel kernel stack memory region.

This declares a region of memory for use as a thread stack, for threads that exclusively run in supervisor mode. This is also suitable for declaring special stacks for interrupt or exception handling.

Stacks declared with this macro may not host user mode threads.

It is legal to precede this definition with the ‘static’ keyword.

It is NOT legal to take the `sizeof(sym)` and pass that to the `stackSize` parameter of `k_thread_create()`, it may not be the same as the ‘size’ parameter. Use `K_KERNEL_STACK_SIZEOF()` instead.

The total amount of memory allocated may be increased to accommodate fixed-size stack overflow guards.

#### Parameters

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

`K_KERNEL_PINNED_STACK_DEFINE(sym, size)`

Define a toplevel kernel stack memory region in pinned section.

See `K_KERNEL_STACK_DEFINE()` for more information and constraints.

This puts the stack into the pinned `noinit` linker section if `CONFIG_LINKER_USE_PINNED_SECTION` is enabled, or else it would put the stack into the same section as `K_KERNEL_STACK_DEFINE()`.

#### Parameters

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

`K_KERNEL_STACK_ARRAY_DEFINE(sym, nmemb, size)`

Define a toplevel array of kernel stack memory regions.

Stacks declared with this macro may not host user mode threads.

#### Parameters

- `sym` – Kernel stack array symbol name
- `nmemb` – Number of stacks to declare
- `size` – Size of the stack memory region

`K_KERNEL_PINNED_STACK_ARRAY_DEFINE(sym, nmemb, size)`

Define a toplevel array of kernel stack memory regions in pinned section.

See [K\\_KERNEL\\_STACK\\_ARRAY\\_DEFINE\(\)](#) for more information and constraints.

This puts the stack into the pinned noinit linker section if `CONFIG_LINKER_USE_PINNED_SECTION` is enabled, or else it would put the stack into the same section as [K\\_KERNEL\\_STACK\\_ARRAY\\_DEFINE\(\)](#).

#### Parameters

- `sym` – Kernel stack array symbol name
- `nmemb` – Number of stacks to declare
- `size` – Size of the stack memory region

`K_KERNEL_STACK_MEMBER(sym, size)`

Declare an embedded stack memory region.

Used for kernel stacks embedded within other data structures.

Stacks declared with this macro may not host user mode threads.

#### Parameters

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

`K_KERNEL_STACK_SIZEOF(sym)`

`K_THREAD_STACK_SIZEOF(sym)`

Return the size in bytes of a stack memory region.

Convenience macro for passing the desired stack size to [k\\_thread\\_create\(\)](#) since the underlying implementation may actually create something larger (for instance a guard area).

The value returned here is not guaranteed to match the ‘size’ parameter passed to `K_THREAD_STACK_DEFINE` and may be larger, but is always safe to pass to [k\\_thread\\_create\(\)](#) for the associated stack object.

#### Parameters

- `sym` – Stack memory symbol

**Returns** Size of the stack buffer

`K_THREAD_STACK_DEFINE(sym, size)`

Declare a toplevel thread stack memory region.

This declares a region of memory suitable for use as a thread’s stack.

This is the generic, historical definition. Align to `Z_THREAD_STACK_OBJ_ALIGN` and put in ‘noinit’ section so that it isn’t zeroed at boot

The declared symbol will always be a `k_thread_stack_t` which can be passed to [k\\_thread\\_create\(\)](#), but should otherwise not be manipulated. If the buffer inside needs to be examined, examine `thread->stack_info` for the associated thread object to obtain the boundaries.

It is legal to precede this definition with the ‘static’ keyword.

It is NOT legal to take the `sizeof(sym)` and pass that to the `stackSize` parameter of [k\\_thread\\_create\(\)](#), it may not be the same as the ‘size’ parameter. Use [K\\_THREAD\\_STACK\\_SIZEOF\(\)](#) instead.

Some arches may round the size of the usable stack region up to satisfy alignment constraints. [K\\_THREAD\\_STACK\\_SIZEOF\(\)](#) will return the aligned size.

**Parameters**

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

`K_THREAD_PINNED_STACK_DEFINE(sym, size)`

Define a toplevel thread stack memory region in pinned section.

This declares a region of memory suitable for use as a thread's stack.

This is the generic, historical definition. Align to `Z_THREAD_STACK_OBJ_ALIGN` and put in 'noinit' section so that it isn't zeroed at boot

The declared symbol will always be a `k_thread_stack_t` which can be passed to `k_thread_create()`, but should otherwise not be manipulated. If the buffer inside needs to be examined, examine `thread->stack_info` for the associated thread object to obtain the boundaries.

It is legal to precede this definition with the 'static' keyword.

It is NOT legal to take the `sizeof(sym)` and pass that to the `stackSize` parameter of `k_thread_create()`, it may not be the same as the 'size' parameter. Use `K_THREAD_STACK_SIZEOF()` instead.

Some arches may round the size of the usable stack region up to satisfy alignment constraints. `K_THREAD_STACK_SIZEOF()` will return the aligned size.

This puts the stack into the pinned noinit linker section if `CONFIG_LINKER_USE_PINNED_SECTION` is enabled, or else it would put the stack into the same section as `K_THREAD_STACK_DEFINE()`.

**Parameters**

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

`K_THREAD_STACK_LEN(size)`

Calculate size of stacks to be allocated in a stack array.

This macro calculates the size to be allocated for the stacks inside a stack array. It accepts the indicated "size" as a parameter and if required, pads some extra bytes (e.g. for MPU scenarios). Refer `K_THREAD_STACK_ARRAY_DEFINE` definition to see how this is used. The returned size ensures each array member will be aligned to the required stack base alignment.

**Parameters**

- `size` – Size of the stack memory region

**Returns** Appropriate size for an array member

`K_THREAD_STACK_ARRAY_DEFINE(sym, nmemb, size)`

Declare a toplevel array of thread stack memory regions.

Create an array of equally sized stacks. See `K_THREAD_STACK_DEFINE` definition for additional details and constraints.

This is the generic, historical definition. Align to `Z_THREAD_STACK_OBJ_ALIGN` and put in 'noinit' section so that it isn't zeroed at boot

**Parameters**

- `sym` – Thread stack symbol name
- `nmemb` – Number of stacks to declare
- `size` – Size of the stack memory region

`K_THREAD_PINNED_STACK_ARRAY_DEFINE(sym, nmemb, size)`

Declare a toplevel array of thread stack memory regions in pinned section.

Create an array of equally sized stacks. See `K_THREAD_STACK_DEFINE` definition for additional details and constraints.

This is the generic, historical definition. Align to `Z_THREAD_STACK_OBJ_ALIGN` and put in ‘noinit’ section so that it isn’t zeroed at boot

This puts the stack into the pinned noinit linker section if `CONFIG_LINKER_USE_PINNED_SECTION` is enabled, or else it would put the stack into the same section as [K\\_THREAD\\_STACK\\_DEFINE\(\)](#).

#### Parameters

- `sym` – Thread stack symbol name
- `nmemb` – Number of stacks to declare
- `size` – Size of the stack memory region

`K_THREAD_STACK_MEMBER(sym, size)`

Declare an embedded stack memory region.

Used for stacks embedded within other data structures. Use is highly discouraged but in some cases necessary. For memory protection scenarios, it is very important that any RAM preceding this member not be writable by threads else a stack overflow will lead to silent corruption. In other words, the containing data structure should live in RAM owned by the kernel.

A user thread can only be started with a stack defined in this way if the thread starting it is in supervisor mode.

This is now deprecated, as stacks defined in this way are not usable from user mode. Use `K_KERNEL_STACK_MEMBER`.

#### Parameters

- `sym` – Thread stack symbol name
- `size` – Size of the stack memory region

## Scheduling

The kernel’s priority-based scheduler allows an application’s threads to share the CPU.

**Concepts** The scheduler determines which thread is allowed to execute at any point in time; this thread is known as the **current thread**.

There are various points in time when the scheduler is given an opportunity to change the identity of the current thread. These points are called **reschedule points**. Some potential reschedule points are:

- transition of a thread from running state to a suspended or waiting state, for example by [k\\_sem\\_take\(\)](#) or [k\\_sleep\(\)](#).
- transition of a thread to the [ready state](#), for example by [k\\_sem\\_give\(\)](#) or [k\\_thread\\_start\(\)](#)
- return to thread context after processing an interrupt
- when a running thread invokes [k\\_yield\(\)](#)

A thread **sleeps** when it voluntarily initiates an operation that transitions itself to a suspended or waiting state.

Whenever the scheduler changes the identity of the current thread, or when execution of the current thread is replaced by an ISR, the kernel first saves the current thread’s CPU register values. These register values get restored when the thread later resumes execution.

**Scheduling Algorithm** The kernel’s scheduler selects the highest priority ready thread to be the current thread. When multiple ready threads of the same priority exist, the scheduler chooses the one that has been waiting longest.

---

**Note:** Execution of ISRs takes precedence over thread execution, so the execution of the current thread may be replaced by an ISR at any time unless interrupts have been masked. This applies to both cooperative threads and preemptive threads.

---

The kernel can be built with one of several choices for the ready queue implementation, offering different choices between code size, constant factor runtime overhead and performance scaling when many threads are added.

- Simple linked-list ready queue (**:kconfig: `CONFIG\_SCHED\_DUMB`**)

The scheduler ready queue will be implemented as a simple unordered list, with very fast constant time performance for single threads and very low code size. This implementation should be selected on systems with constrained code size that will never see more than a small number (3, maybe) of runnable threads in the queue at any given time. On most platforms (that are not otherwise using the red/black tree) this results in a savings of ~2k of code size.

- Red/black tree ready queue (**:kconfig: `CONFIG\_SCHED\_SCALABLE`**)

The scheduler ready queue will be implemented as a red/black tree. This has rather slower constant-time insertion and removal overhead, and on most platforms (that are not otherwise using the red/black tree somewhere) requires an extra ~2kb of code. The resulting behavior will scale cleanly and quickly into the many thousands of threads.

Use this for applications needing many concurrent runnable threads (> 20 or so). Most applications won’t need this ready queue implementation.

- Traditional multi-queue ready queue (**:kconfig: `CONFIG\_SCHED\_MULTIQ`**)

When selected, the scheduler ready queue will be implemented as the classic/textbook array of lists, one per priority (max 32 priorities).

This corresponds to the scheduler algorithm used in Zephyr versions prior to 1.12.

It incurs only a tiny code size overhead vs. the “dumb” scheduler and runs in O(1) time in almost all circumstances with very low constant factor. But it requires a fairly large RAM budget to store those list heads, and the limited features make it incompatible with features like deadline scheduling that need to sort threads more finely, and SMP affinity which need to traverse the list of threads.

Typical applications with small numbers of runnable threads probably want the DUMB scheduler.

The wait\_q abstraction used in IPC primitives to pend threads for later wakeup shares the same backend data structure choices as the scheduler, and can use the same options.

- Scalable wait\_q implementation (**:kconfig: `CONFIG\_WAITQ\_SCALABLE`**)

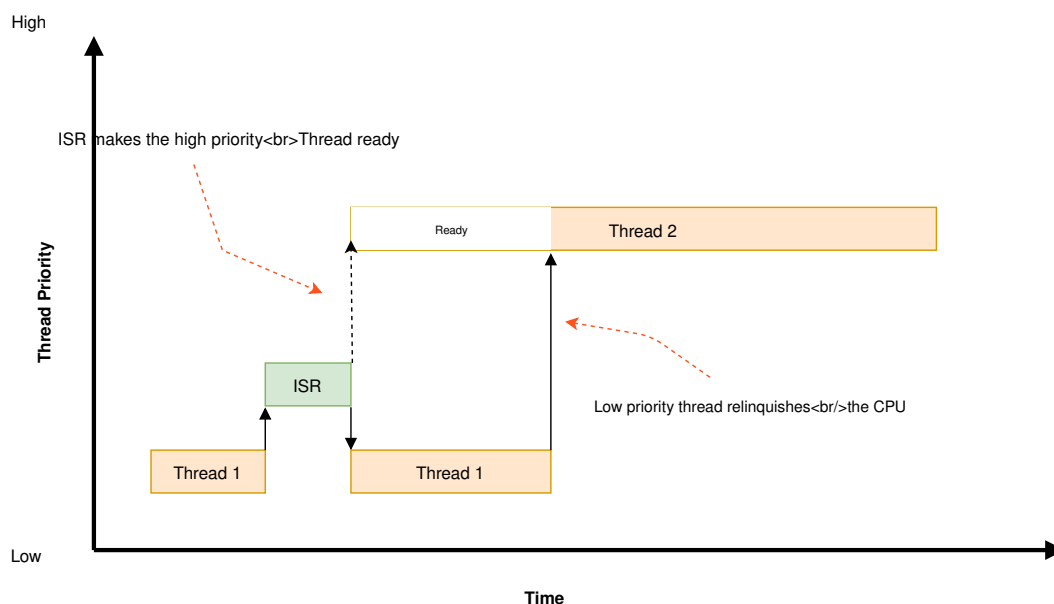

When selected, the wait\_q will be implemented with a balanced tree. Choose this if you expect to have many threads waiting on individual primitives. There is a ~2kb code size increase over **:kconfig: `CONFIG\_WAITQ\_DUMB`** (which may be shared with **:kconfig: `CONFIG\_SCHED\_SCALABLE`**) if the red/black tree is not used elsewhere in the application, and pend/unpend operations on “small” queues will be somewhat slower (though this is not generally a performance path).

- Simple linked-list wait\_q (**:kconfig: `CONFIG\_WAITQ\_DUMB`**)

When selected, the wait\_q will be implemented with a doubly-linked list. Choose this if you expect to have only a few threads blocked on any single IPC primitive.

**Cooperative Time Slicing** Once a cooperative thread becomes the current thread, it remains the current thread until it performs an action that makes it unready. Consequently, if a cooperative thread

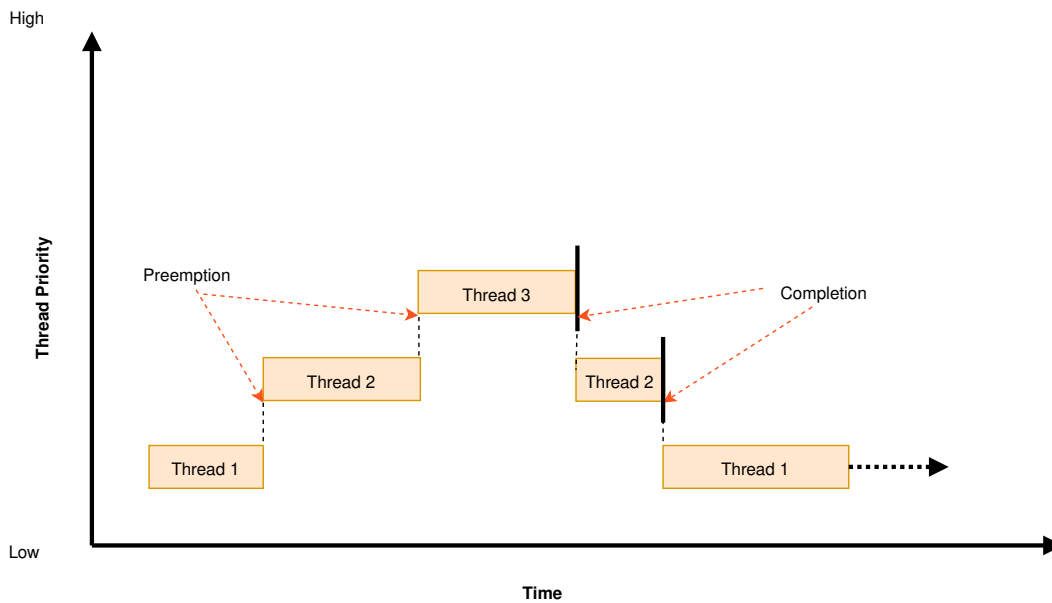

performs lengthy computations, it may cause an unacceptable delay in the scheduling of other threads, including those of higher priority and equal priority.

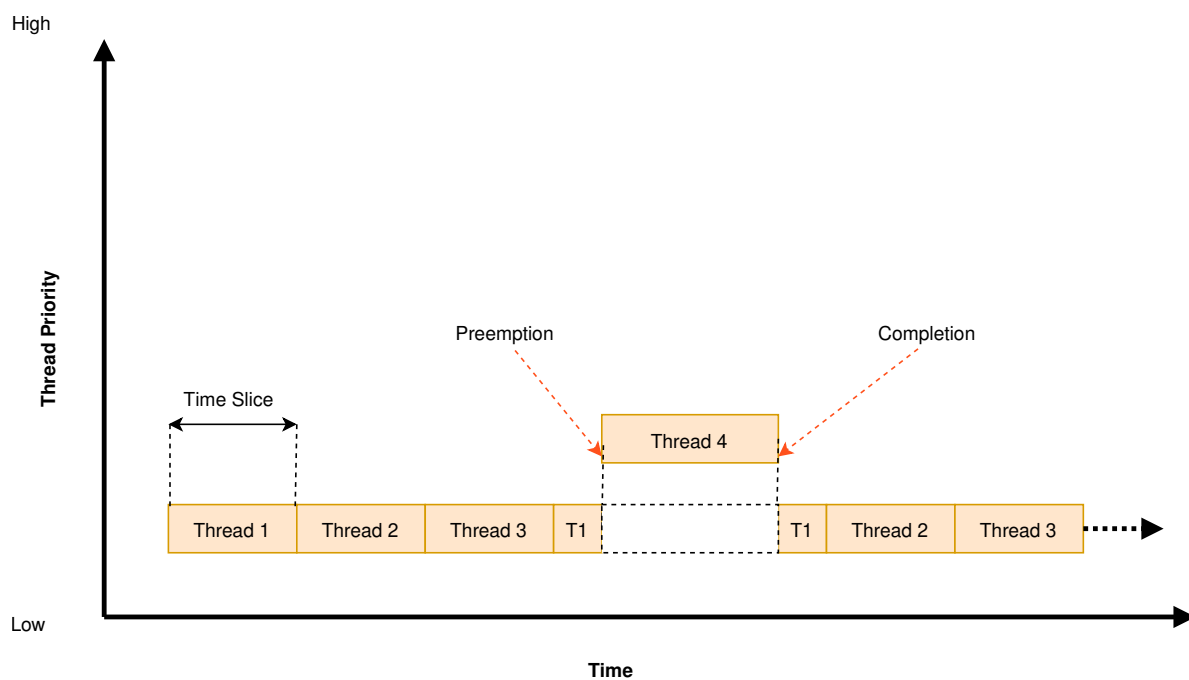

To overcome such problems, a cooperative thread can voluntarily relinquish the CPU from time to time to permit other threads to execute. A thread can relinquish the CPU in two ways:

- Calling `k_yield()` puts the thread at the back of the scheduler's prioritized list of ready threads, and then invokes the scheduler. All ready threads whose priority is higher or equal to that of the yielding thread are then allowed to execute before the yielding thread is rescheduled. If no such ready threads exist, the scheduler immediately reschedules the yielding thread without context switching.
- Calling `k_sleep()` makes the thread unready for a specified time period. Ready threads of *all* priorities are then allowed to execute; however, there is no guarantee that threads whose priority is lower than that of the sleeping thread will actually be scheduled before the sleeping thread becomes ready once again.

**Preemptive Time Slicing** Once a preemptive thread becomes the current thread, it remains the current thread until a higher priority thread becomes ready, or until the thread performs an action that makes it unready. Consequently, if a preemptive thread performs lengthy computations, it may cause an unacceptable delay in the scheduling of other threads, including those of equal priority.

To overcome such problems, a preemptive thread can perform cooperative time slicing (as described above), or the scheduler's time slicing capability can be used to allow other threads of the same priority to execute.

The scheduler divides time into a series of **time slices**, where slices are measured in system clock ticks. The time slice size is configurable, but this size can be changed while the application is running.

At the end of every time slice, the scheduler checks to see if the current thread is preemptible and, if so, implicitly invokes `k_yield()` on behalf of the thread. This gives other ready threads of the same priority the opportunity to execute before the current thread is scheduled again. If no threads of equal priority are ready, the current thread remains the current thread.

Threads with a priority higher than specified limit are exempt from preemptive time slicing, and are never preempted by a thread of equal priority. This allows an application to use preemptive time slicing only when dealing with lower priority threads that are less time-sensitive.

**Note:** The kernel's time slicing algorithm does *not* ensure that a set of equal-priority threads receive an

equitable amount of CPU time, since it does not measure the amount of time a thread actually gets to execute. However, the algorithm *does* ensure that a thread never executes for longer than a single time slice without being required to yield.

---

**Scheduler Locking** A preemptible thread that does not wish to be preempted while performing a critical operation can instruct the scheduler to temporarily treat it as a cooperative thread by calling `k_sched_lock()`. This prevents other threads from interfering while the critical operation is being performed.

Once the critical operation is complete the preemptible thread must call `k_sched_unlock()` to restore its normal, preemptible status.

If a thread calls `k_sched_lock()` and subsequently performs an action that makes it unready, the scheduler will switch the locking thread out and allow other threads to execute. When the locking thread again becomes the current thread, its non-preemptible status is maintained.

---

**Note:** Locking out the scheduler is a more efficient way for a preemptible thread to prevent preemption than changing its priority level to a negative value.

---

**Thread Sleeping** A thread can call `k_sleep()` to delay its processing for a specified time period. During the time the thread is sleeping the CPU is relinquished to allow other ready threads to execute. Once the specified delay has elapsed the thread becomes ready and is eligible to be scheduled once again.

A sleeping thread can be woken up prematurely by another thread using `k_wakeup()`. This technique can sometimes be used to permit the secondary thread to signal the sleeping thread that something has occurred *without* requiring the threads to define a kernel synchronization object, such as a semaphore. Waking up a thread that is not sleeping is allowed, but has no effect.

**Busy Waiting** A thread can call `k_busy_wait()` to perform a busy wait that delays its processing for a specified time period *without* relinquishing the CPU to another ready thread.

A busy wait is typically used instead of thread sleeping when the required delay is too short to warrant having the scheduler context switch from the current thread to another thread and then back again.

**Suggested Uses** Use cooperative threads for device drivers and other performance-critical work.

Use cooperative threads to implement mutually exclusion without the need for a kernel object, such as a mutex.

Use preemptive threads to give priority to time-sensitive processing over less time-sensitive processing.

## System Threads

- *Implementation*
  - *Writing a main() function*
- *Suggested Uses*

A *system thread* is a thread that the kernel spawns automatically during system initialization.

The kernel spawns the following system threads:

**Main thread** This thread performs kernel initialization, then calls the application’s `main()` function (if one is defined).

By default, the main thread uses the highest configured preemptible thread priority (i.e. 0). If the kernel is not configured to support preemptible threads, the main thread uses the lowest configured cooperative thread priority (i.e. -1).

The main thread is an essential thread while it is performing kernel initialization or executing the application’s `main()` function; this means a fatal system error is raised if the thread aborts. If `main()` is not defined, or if it executes and then does a normal return, the main thread terminates normally and no error is raised.

**Idle thread** This thread executes when there is no other work for the system to do. If possible, the idle thread activates the board’s power management support to save power; otherwise, the idle thread simply performs a “do nothing” loop. The idle thread remains in existence as long as the system is running and never terminates.

The idle thread always uses the lowest configured thread priority. If this makes it a cooperative thread, the idle thread repeatedly yields the CPU to allow the application’s other threads to run when they need to.

The idle thread is an essential thread, which means a fatal system error is raised if the thread aborts.

Additional system threads may also be spawned, depending on the kernel and board configuration options specified by the application. For example, enabling the system workqueue spawns a system thread that services the work items submitted to it. (See [Workqueue Threads](#).)

## Implementation

**Writing a `main()` function** An application-supplied `main()` function begins executing once kernel initialization is complete. The kernel does not pass any arguments to the function.

The following code outlines a trivial `main()` function. The function used by a real application can be as complex as needed.

```
void main(void)
{
    /* initialize a semaphore */
    ...

    /* register an ISR that gives the semaphore */
    ...

    /* monitor the semaphore forever */
    while (1) {
        /* wait for the semaphore to be given by the ISR */
        ...
        /* do whatever processing is now needed */
        ...
    }
}
```

**Suggested Uses** Use the main thread to perform thread-based processing in an application that only requires a single thread, rather than defining an additional application-specific thread.

## Workqueue Threads

- [Work Item Lifecycle](#)
- [Delayable Work](#)
- [Triggered Work](#)
- [System Workqueue](#)
- [How to Use Workqueues](#)
- [Workqueue Best Practices](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

A *workqueue* is a kernel object that uses a dedicated thread to process work items in a first in, first out manner. Each work item is processed by calling the function specified by the work item. A workqueue is typically used by an ISR or a high-priority thread to offload non-urgent processing to a lower-priority thread so it does not impact time-sensitive processing.

Any number of workqueues can be defined (limited only by available RAM). Each workqueue is referenced by its memory address.

A workqueue has the following key properties:

- A **queue** of work items that have been added, but not yet processed.
- A **thread** that processes the work items in the queue. The priority of the thread is configurable, allowing it to be either cooperative or preemptive as required.

Regardless of workqueue thread priority the workqueue thread will yield between each submitted work item, to prevent a cooperative workqueue from starving other threads.

A workqueue must be initialized before it can be used. This sets its queue to empty and spawns the workqueue's thread. The thread runs forever, but sleeps when no work items are available.

---

**Note:** The behavior described here is changed from the Zephyr workqueue implementation used prior to release 2.6. Among the changes are:

- Precise tracking of the status of cancelled work items, so that the caller need not be concerned that an item may be processing when the cancellation returns. Checking of return values on cancellation is still required.
- Direct submission of delayable work items to the queue with `K_NO_WAIT` rather than always going through the timeout API, which could introduce delays.
- The ability to wait until a work item has completed or a queue has been drained.
- Finer control of behavior when scheduling a delayable work item, specifically allowing a previous deadline to remain unchanged when a work item is scheduled again.
- Safe handling of work item resubmission when the item is being processed on another workqueue.

Using the return values of `k_work_busy_get()` or `k_work_is_pending()`, or measurements of remaining time until delayable work is scheduled, should be avoided to prevent race conditions of the type observed with the previous implementation. See also [Workqueue Best Practices](#).

---

**Work Item Lifecycle** Any number of **work items** can be defined. Each work item is referenced by its memory address.

A work item is assigned a **handler function**, which is the function executed by the workqueue's thread when the work item is processed. This function accepts a single argument, which is the address of the work item itself. The work item also maintains information about its status.

A work item must be initialized before it can be used. This records the work item's handler function and marks it as not pending.

A work item may be **queued** (`K_WORK_QUEUED`) by submitting it to a workqueue by an ISR or a thread. Submitting a work item appends the work item to the workqueue's queue. Once the workqueue's thread has processed all of the preceding work items in its queue the thread will remove the next work item from the queue and invoke the work item's handler function. Depending on the scheduling priority of the workqueue's thread, and the work required by other items in the queue, a queued work item may be processed quickly or it may remain in the queue for an extended period of time.

A delayable work item may be **scheduled** (`K_WORK_DELAYED`) to a workqueue; see [Delayable Work](#).

A work item will be **running** (`K_WORK_RUNNING`) when it is running on a work queue, and may also be **canceled** (`K_WORK_CANCELING`) if it started running before a thread has requested that it be cancelled.

A work item can be in multiple states; for example it can be:

- running on a queue;
- marked canceling (because a thread used `k_work_cancel_sync()` to wait until the work item completed);
- queued to run again on the same queue;
- scheduled to be submitted to a (possibly different) queue

*all simultaneously.* A work item that is in any of these states is **pending** (`k_work_is_pending()`) or **busy** (`k_work_busy_get()`).

A handler function can use any kernel API available to threads. However, operations that are potentially blocking (e.g. taking a semaphore) must be used with care, since the workqueue cannot process subsequent work items in its queue until the handler function finishes executing.

The single argument that is passed to a handler function can be ignored if it is not required. If the handler function requires additional information about the work it is to perform, the work item can be embedded in a larger data structure. The handler function can then use the argument value to compute the address of the enclosing data structure with `CONTAINER_OF`, and thereby obtain access to the additional information it needs.

A work item is typically initialized once and then submitted to a specific workqueue whenever work needs to be performed. If an ISR or a thread attempts to submit a work item that is already queued the work item is not affected; the work item remains in its current place in the workqueue's queue, and the work is only performed once.

A handler function is permitted to re-submit its work item argument to the workqueue, since the work item is no longer queued at that time. This allows the handler to execute work in stages, without unduly delaying the processing of other work items in the workqueue's queue.

---

**Important:** A pending work item *must not* be altered until the item has been processed by the workqueue thread. This means a work item must not be re-initialized while it is busy. Furthermore, any additional information the work item's handler function needs to perform its work must not be altered until the handler function has finished executing.

---

**Delayable Work** An ISR or a thread may need to schedule a work item that is to be processed only after a specified period of time, rather than immediately. This can be done by **scheduling a delayable work item** to be submitted to a workqueue at a future time.

A delayable work item contains a standard work item but adds fields that record when and where the item should be submitted.

A delayable work item is initialized and scheduled to a workqueue in a similar manner to a standard work item, although different kernel APIs are used. When the schedule request is made the kernel initiates a timeout mechanism that is triggered after the specified delay has elapsed. Once the timeout occurs the kernel submits the work item to the specified workqueue, where it remains queued until it is processed in the standard manner.

Note that work handler used for delayable still receives a pointer to the underlying non-delayable work structure, which is not publicly accessible from `k_work_delayable`. To get access to an object that contains the delayable work object use this idiom:

```
static void work_handler(struct k_work *work)
{
    struct k_work_delayable *dwork = k_work_delayable_from_work(work);
    struct work_context *ctx = CONTAINER_OF(dwork, struct work_context,
                                             timed_work);
    ...
}
```

**Triggered Work** The `k_work_poll_submit()` interface schedules a triggered work item in response to a **poll event** (see [Polling API](#)), that will call a user-defined function when a monitored resource becomes available or poll signal is raised, or a timeout occurs. In contrast to `k_poll()`, the triggered work does not require a dedicated thread waiting or actively polling for a poll event.

A triggered work item is a standard work item that has the following added properties:

- A pointer to an array of poll events that will trigger work item submissions to the workqueue
- A size of the array containing poll events.

A triggered work item is initialized and submitted to a workqueue in a similar manner to a standard work item, although dedicated kernel APIs are used. When a submit request is made, the kernel begins observing kernel objects specified by the poll events. Once at least one of the observed kernel object's changes state, the work item is submitted to the specified workqueue, where it remains queued until it is processed in the standard manner.

---

**Important:** The triggered work item as well as the referenced array of poll events have to be valid and cannot be modified for a complete triggered work item lifecycle, from submission to work item execution or cancellation.

---

An ISR or a thread may **cancel** a triggered work item it has submitted as long as it is still waiting for a poll event. In such case, the kernel stops waiting for attached poll events and the specified work is not executed. Otherwise the cancellation cannot be performed.

**System Workqueue** The kernel defines a workqueue known as the *system workqueue*, which is available to any application or kernel code that requires workqueue support. The system workqueue is optional, and only exists if the application makes use of it.

---

**Important:** Additional workqueues should only be defined when it is not possible to submit new work items to the system workqueue, since each new workqueue incurs a significant cost in memory footprint. A new workqueue can be justified if it is not possible for its work items to co-exist with existing system workqueue work items without an unacceptable impact; for example, if the new work items perform blocking operations that would delay other system workqueue processing to an unacceptable degree.

---

## How to Use Workqueues

**Defining and Controlling a Workqueue** A workqueue is defined using a variable of type `k_work_q`. The workqueue is initialized by defining the stack area used by its thread, initializing the `k_work_q`, either zeroing its memory or calling `k_work_queue_init()`, and then calling `k_work_queue_start()`. The stack area must be defined using `K_THREAD_STACK_DEFINE` to ensure it is properly set up in memory.

The following code defines and initializes a workqueue:

```
#define MY_STACK_SIZE 512
#define MY_PRIORITY 5

K_THREAD_STACK_DEFINE(my_stack_area, MY_STACK_SIZE);

struct k_work_q my_work_q;

k_work_queue_init(&my_work_q);

k_work_queue_start(&my_work_q, my_stack_area,
                  K_THREAD_STACK_SIZEOF(my_stack_area), MY_PRIORITY,
                  NULL);
```

In addition the queue identity and certain behavior related to thread rescheduling can be controlled by the optional final parameter; see `k_work_queue_start()` for details.

The following API can be used to interact with a workqueue:

- `k_work_queue_drain()` can be used to block the caller until the work queue has no items left. Work items resubmitted from the workqueue thread are accepted while a queue is draining, but work items from any other thread or ISR are rejected. The restriction on submitting more work can be extended past the completion of the drain operation in order to allow the blocking thread to perform additional work while the queue is “plugged”. Note that draining a queue has no effect on scheduling or processing delayable items, but if the queue is plugged and the deadline expires the item will silently fail to be submitted.
- `k_work_queue_unplug()` removes any previous block on submission to the queue due to a previous drain operation.

**Submitting a Work Item** A work item is defined using a variable of type `k_work`. It must be initialized by calling `k_work_init()`, unless it is defined using `K_WORK_DEFINE` in which case initialization is performed at compile-time.

An initialized work item can be submitted to the system workqueue by calling `k_work_submit()`, or to a specified workqueue by calling `k_work_submit_to_queue()`.

The following code demonstrates how an ISR can offload the printing of error messages to the system workqueue. Note that if the ISR attempts to resubmit the work item while it is still queued, the work item is left unchanged and the associated error message will not be printed.

```
struct device_info {
    struct k_work work;
    char name[16]
} my_device;

void my_isr(void *arg)
{
    ...
    if (error detected) {
        k_work_submit(&my_device.work);
    }
    ...
}
```

(continues on next page)

(continued from previous page)

```

void print_error(struct k_work *item)
{
    struct device_info *the_device =
        CONTAINER_OF(item, struct device_info, work);
    printk("Got error on device %s\n", the_device->name);
}

/* initialize name info for a device */
strcpy(my_device.name, "FOO_dev");

/* initialize work item for printing device's error messages */
k_work_init(&my_device.work, print_error);

/* install my_isr() as interrupt handler for the device (not shown) */
...

```

The following API can be used to check the status of or synchronize with the work item:

- `k_work_busy_get()` returns a snapshot of flags indicating work item state. A zero value indicates the work is not scheduled, submitted, being executed, or otherwise still being referenced by the workqueue infrastructure.
- `k_work_is_pending()` is a helper that indicates true if and only if the work is scheduled, queued, or running.
- `k_work_flush()` may be invoked from threads to block until the work item has completed. It returns immediately if the work is not pending.
- `k_work_cancel()` attempts to prevent the work item from being executed. This may or may not be successful. This is safe to invoke from ISRs.
- `k_work_cancel_sync()` may be invoked from threads to block until the work completes; it will return immediately if the cancellation was successful or not necessary (the work wasn't submitted or running). This can be used after `k_work_cancel()` is invoked (from an ISR) to confirm completion of an ISR-initiated cancellation.

**Scheduling a Delayable Work Item** A delayable work item is defined using a variable of type `k_work_delayable`. It must be initialized by calling `k_work_init_delayable()`.

For delayed work there are two common use cases, depending on whether a deadline should be extended if a new event occurs. An example is collecting data that comes in asynchronously, e.g. characters from a UART associated with a keyboard. There are two APIs that submit work after a delay:

- `k_work_schedule()` (or `k_work_schedule_for_queue()`) schedules work to be executed at a specific time or after a delay. Further attempts to schedule the same item with this API before the delay completes will not change the time at which the item will be submitted to its queue. Use this if the policy is to keep collecting data until a specified delay since the **first** unprocessed data was received;
- `k_work_reschedule()` (or `k_work_reschedule_for_queue()`) unconditionally sets the deadline for the work, replacing any previous incomplete delay and changing the destination queue if necessary. Use this if the policy is to keep collecting data until a specified delay since the **last** unprocessed data was received.

If the work item is not scheduled both APIs behave the same. If `K_NO_WAIT` is specified as the delay the behavior is as if the item was immediately submitted directly to the target queue, without waiting for a minimal timeout (unless `k_work_schedule()` is used and a previous delay has not completed).

Both also have variants that allow control of the queue used for submission.

The helper function `k_work_delayable_from_work()` can be used to get a pointer to the containing `k_work_delayable` from a pointer to `k_work` that is passed to a work handler function.

The following additional API can be used to check the status of or synchronize with the work item:

- `k_work_delayable_busy_get()` is the analog to `k_work_busy_get()` for delayable work.
- `k_work_delayable_is_pending()` is the analog to `k_work_is_pending()` for delayable work.
- `k_work_flush_delayable()` is the analog to `k_work_flush()` for delayable work.
- `k_work_cancel_delayable()` is the analog to `k_work_cancel()` for delayable work; similarly with `k_work_cancel_delayable_sync()`.

**Synchronizing with Work Items** While the state of both regular and delayable work items can be determined from any context using `k_work_busy_get()` and `k_work_delayable_busy_get()` some use cases require synchronizing with work items after they've been submitted. `k_work_flush()`, `k_work_cancel_sync()`, and `k_work_cancel_delayable_sync()` can be invoked from thread context to wait until the requested state has been reached.

These APIs must be provided with a `k_work_sync` object that has no application-inspectable components but is needed to provide the synchronization objects. These objects should not be allocated on a stack if the code is expected to work on architectures with `:kconfig: `CONFIG_KERNEL_COHERENCE``.

## Workqueue Best Practices

**Avoid Race Conditions** Sometimes the data a work item must process is naturally thread-safe, for example when it's put into a `k_queue` by some thread and processed in the work thread. More often external synchronization is required to avoid data races: cases where the work thread might inspect or manipulate shared state that's being accessed by another thread or interrupt. Such state might be a flag indicating that work needs to be done, or a shared object that is filled by an ISR or thread and read by the work handler.

For simple flags *Atomic Services* may be sufficient. In other cases spin locks (`k_spinlock_t`) or thread-aware locks (`k_sem`, `k_mutex`, ...) may be used to ensure data races don't occur.

If the selected lock mechanism can *sleep* then allowing the work thread to sleep will starve other work queue items, which may need to make progress in order to get the lock released. Work handlers should try to take the lock with its no-wait path. For example:

```
static void work_handler(struct work *work)
{
    struct work_context *parent = CONTAINER_OF(work, struct work_context,
                                                work_item);

    if (k_mutex_lock(&parent->lock, K_NO_WAIT) != 0) {
        /* NB: Submit will fail if the work item is being cancelled. */
        (void)k_work_submit(work);
        return;
    }

    /* do stuff under lock */
    k_mutex_unlock(&parent->lock);
    /* do stuff without lock */
}
```

Be aware that if the lock is held by a thread with a lower priority than the work queue the resubmission may starve the thread that would release the lock, causing the application to fail. Where the idiom above is required a delayable work item is preferred, and the work should be (re-)scheduled with a non-zero delay to allow the thread holding the lock to make progress.

Note that submitting from the work handler can fail if the work item had been cancelled. Generally this is acceptable, since the cancellation will complete once the handler finishes. If it is not, the code above must take other steps to notify the application that the work could not be performed.

Work items in isolation are self-locking, so you don't need to hold an external lock just to submit or schedule them. Even if you use external state protected by such a lock to prevent further resubmission, it's safe to do the resubmit as long as you're sure that eventually the item will take its lock and check that state to determine whether it should do anything. Where a delayable work item is being rescheduled in its handler due to inability to take the lock some other self-locking state, such as an atomic flag set by the application/driver when the cancel is initiated, would be required to detect the cancellation and avoid the cancelled work item being submitted again after the deadline.

**Check Return Values** All work API functions return status of the underlying operation, and in many cases it is important to verify that the intended result was obtained.

- Submitting a work item (`k_work_submit_to_queue()`) can fail if the work is being cancelled or the queue is not accepting new items. If this happens the work will not be executed, which could cause a subsystem that is animated by work handler activity to become non-responsive.
- Asynchronous cancellation (`k_work_cancel()` or `k_work_cancel_delayable()`) can complete while the work item is still being run by a handler. Proceeding to manipulate state shared with the work handler will result in data races that can cause failures.

Many race conditions have been present in Zephyr code because the results of an operation were not checked.

There may be good reason to believe that a return value indicating that the operation did not complete as expected is not a problem. In those cases the code should clearly document this, by (1) casting the return value to `void` to indicate that the result is intentionally ignored, and (2) documenting what happens in the unexpected case. For example:

```
/* If this fails, the work handler will check pub->active and  
 * exit without transmitting.  
 */  
(void)k_work_cancel_delayable(&pub->timer);
```

However in such a case the following code must still avoid data races, as it cannot guarantee that the work thread is not accessing work-related state.

**Don't Optimize Prematurely** The workqueue API is designed to be safe when invoked from multiple threads and interrupts. Attempts to externally inspect a work item's state and make decisions based on the result are likely to create new problems.

So when new work comes in, just submit it. Don't attempt to "optimize" by checking whether the work item is already submitted by inspecting snapshot state with `k_work_is_pending()` or `k_work_busy_get()`, or checking for a non-zero delay from `k_work_delayable_remaining_get()`. Those checks are fragile: a "busy" indication can be obsolete by the time the test is returned, and a "not-busy" indication can also be wrong if work is submitted from multiple contexts, or (for delayable work) if the deadline has completed but the work is still in queued or running state.

A general best practice is to always maintain in shared state some condition that can be checked by the handler to confirm whether there is work to be done. This way you can use the work handler as the standard cleanup path: rather than having to deal with cancellation and cleanup at points where items are submitted, you may be able to have everything done in the work handler itself.

A rare case where you could safely use `k_work_is_pending()` is as a check to avoid invoking `k_work_flush()` or `k_work_cancel_sync()`, if you are *certain* that nothing else might submit the work while you're checking (generally because you're holding a lock that prevents access to state used for submission).

**Suggested Uses** Use the system workqueue to defer complex interrupt-related processing from an ISR to a shared thread. This allows the interrupt-related processing to be done promptly without compromising the system's ability to respond to subsequent interrupts, and does not require the application to define and manage an additional thread to do the processing.

**Configuration Options** Related configuration options:

- `:kconfig: `CONFIG_SYSTEM_WORKQUEUE_STACK_SIZE``
- `:kconfig: `CONFIG_SYSTEM_WORKQUEUE_PRIORITY``
- `:kconfig: `CONFIG_SYSTEM_WORKQUEUE_NO_YIELD``

## API Reference

group workqueue\_apis

### Defines

`K_WORK_DELAYABLE_DEFINE(work, work_handler)`

Initialize a statically-defined delayable work item.

This macro can be used to initialize a statically-defined delayable work item, prior to its first use. For example,

```
static K_WORK_DELAYABLE_DEFINE(<dwork>, <work_handler>);
```

Note that if the runtime dependencies support initialization with [k\\_work\\_init\\_delayable\(\)](#) using that will eliminate the initialized object in ROM that is produced by this macro and copied in at system startup.

#### Parameters

- `work` – Symbol name for delayable work item object
- `work_handler` – Function to invoke each time work item is processed.

`K_WORK_USER_DEFINE(work, work_handler)`

Initialize a statically-defined user work item.

This macro can be used to initialize a statically-defined user work item, prior to its first use. For example,

```
static K_WORK_USER_DEFINE(<work>, <work_handler>);
```

#### Parameters

- `work` – Symbol name for work item object
- `work_handler` – Function to invoke each time work item is processed.

`K_WORK_DEFINE(work, work_handler)`

Initialize a statically-defined work item.

This macro can be used to initialize a statically-defined workqueue work item, prior to its first use. For example,

```
static K_WORK_DEFINE(<work>, <work_handler>);
```

#### Parameters

- `work` – Symbol name for work item object
- `work_handler` – Function to invoke each time work item is processed.

`K_DELAYED_WORK_DEFINE(work, work_handler)`

Initialize a statically-defined delayed work item.

This macro can be used to initialize a statically-defined workqueue delayed work item, prior to its first use. For example,

```
static K_DELAYED_WORK_DEFINE(<work>, <work_handler>);
```

#### Parameters

- `work` – Symbol name for delayed work item object
- `work_handler` – Function to invoke each time work item is processed.

### Typedefs

```
typedef void (*k_work_handler_t)(struct k_work *work)
```

The signature for a work item handler function.

The function will be invoked by the thread animating a work queue.

**Param `work`** the work item that provided the handler.

```
typedef void (*k_work_user_handler_t)(struct k_work_user *work)
```

Work item handler function type for user work queues.

A work item's handler function is executed by a user workqueue's thread when the work item is processed by the workqueue.

**Param `work`** Address of the work item.

**Return** N/A

### Enums

```
enum [anonymous]
```

*Values:*

enumerator `K_WORK_RUNNING` = `BIT(K_WORK_RUNNING_BIT)`

Flag indicating a work item that is running under a work queue thread.

Accessed via `k_work_busy_get()`. May co-occur with other flags.

enumerator `K_WORK_CANCELING` = `BIT(K_WORK_CANCELING_BIT)`

Flag indicating a work item that is being canceled.

Accessed via `k_work_busy_get()`. May co-occur **with** other flags.

enumerator `K_WORK_QUEUED` = `BIT(K_WORK_QUEUED_BIT)`

Flag indicating a work item that has been submitted to a queue but has not started running.

Accessed via `k_work_busy_get()`. May co-occur with other flags.

enumerator `K_WORK_DELAYED` = `BIT(K_WORK_DELAYED_BIT)`

Flag indicating a delayed work item that is scheduled for submission to a queue.

Accessed via `k_work_busy_get()`. May co-occur with other flags.

## Functions

`void k_work_init(struct k_work *work, k_work_handler_t handler)`

Initialize a (non-delayable) work structure.

This must be invoked before submitting a work structure for the first time. It need not be invoked again on the same work structure. It can be re-invoked to change the associated handler, but this must be done when the work item is idle.

**Function properties (list may not be complete)** *isr-ok*

### Parameters

- `work` – the work structure to be initialized.
- `handler` – the handler to be invoked by the work item.

`int k_work_busy_get(const struct k_work *work)`

Busy state flags from the work item.

A zero return value indicates the work item appears to be idle.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** This is a live snapshot of state, which may change before the result is checked. Use locks where appropriate.

---

### Parameters

- `work` – pointer to the work item.

**Returns** a mask of flags `K_WORK_DELAYED`, `K_WORK_QUEUED`, `K_WORK_RUNNING`, and `K_WORK_CANCELING`.

`static inline bool k_work_is_pending(const struct k_work *work)`

Test whether a work item is currently pending.

Wrapper to determine whether a work item is in a non-idle dstate.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** This is a live snapshot of state, which may change before the result is checked. Use locks where appropriate.

---

#### Parameters

- `work` – pointer to the work item.

**Returns** true if and only if `k_work_busy_get()` returns a non-zero value.

int `k_work_submit_to_queue`(struct `k_work_q` \*queue, struct `k_work` \*work)

Submit a work item to a queue.

Function properties (list may not be complete) *isr-ok*

#### Parameters

- `queue` – pointer to the work queue on which the item should run. If NULL the queue from the most recent submission will be used.
- `work` – pointer to the work item.

#### Return values

- 0 – if work was already submitted to a queue
- 1 – if work was not submitted and has been queued to queue
- 2 – if work was running and has been queued to the queue that was running it
- -EBUSY –
  - if work submission was rejected because the work item is cancelling; or
  - queue is draining; or
  - queue is plugged.
- -EINVAL – if queue is null and the work item has never been run.
- -ENODEV – if queue has not been started.

int `k_work_submit`(struct `k_work` \*work)

Submit a work item to the system queue.

Function properties (list may not be complete) *isr-ok*

#### Parameters

- `work` – pointer to the work item.

**Returns** as with `k_work_submit_to_queue()`.

bool `k_work_flush`(struct `k_work` \*work, struct `k_work_sync` \*sync)

Wait for last-submitted instance to complete.

Resubmissions may occur while waiting, including chained submissions (from within the handler).

---

**Note:** Be careful of caller and work queue thread relative priority. If this function sleeps it will not return until the work queue thread completes the tasks that allow this thread to resume.

---

---

**Note:** Behavior is undefined if this function is invoked on `work` from a work queue running `work`.

---

#### Parameters

- `work` – pointer to the work item.
- `sync` – pointer to an opaque item containing state related to the pending cancellation. The object must persist until the call returns, and be accessible from both the caller thread and the work queue thread. The object must not be used for any other flush or cancel operation until this one completes. On architectures with `CONFIG_KERNEL_COHERENCE` the object must be allocated in coherent memory.

#### Return values

- `true` – if call had to wait for completion
- `false` – if work was already idle

`int k_work_cancel(struct k\_work *work)`

Cancel a work item.

This attempts to prevent a pending (non-delayable) work item from being processed by removing it from the work queue. If the item is being processed, the work item will continue to be processed, but resubmissions are rejected until cancellation completes.

If this returns zero cancellation is complete, otherwise something (probably a work queue thread) is still referencing the item.

See also [k\\_work\\_cancel\\_sync\(\)](#).

#### Function properties (list may not be complete) [isr-ok](#)

#### Parameters

- `work` – pointer to the work item.

**Returns** the [k\\_work\\_busy\\_get\(\)](#) status indicating the state of the item after all cancellation steps performed by this call are completed.

`bool k_work_cancel_sync(struct k\_work *work, struct k\_work\_sync *sync)`

Cancel a work item and wait for it to complete.

Same as [k\\_work\\_cancel\(\)](#) but does not return until cancellation is complete. This can be invoked by a thread after [k\\_work\\_cancel\(\)](#) to synchronize with a previous cancellation.

On return the work structure will be idle unless something submits it after the cancellation was complete.

---

**Note:** Be careful of caller and work queue thread relative priority. If this function sleeps it will not return until the work queue thread completes the tasks that allow this thread to resume.

---

---

**Note:** Behavior is undefined if this function is invoked on `work` from a work queue running `work`.

---

#### Parameters

- `work` – pointer to the work item.
- `sync` – pointer to an opaque item containing state related to the pending cancellation. The object must persist until the call returns, and be accessible from both the caller thread and the work queue thread. The object must not be used for any other flush or cancel operation until this one completes. On architectures with `CONFIG_KERNEL_COHERENCE` the object must be allocated in coherent memory.

#### Return values

- `true` – if work was pending (call had to wait for cancellation of a running handler to complete, or scheduled or submitted operations were cancelled);
- `false` – otherwise

`void k_work_queue_init(struct k\_work\_q *queue)`

Initialize a work queue structure.

This must be invoked before starting a work queue structure for the first time. It need not be invoked again on the same work queue structure.

#### Function properties (list may not be complete) [isr-ok](#)

##### Parameters

- `queue` – the queue structure to be initialized.

`void k_work_queue_start(struct k\_work\_q *queue, k_thread_stack_t *stack, size_t stack_size, int prio, const struct k\_work\_queue\_config *cfg)`

Initialize a work queue.

This configures the work queue thread and starts it running. The function should not be re-invoked on a queue.

##### Parameters

- `queue` – pointer to the queue structure. It must be initialized in zeroed/bss memory or with [k\\_work\\_queue\\_init](#) before use.
- `stack` – pointer to the work thread stack area.
- `stack_size` – size of the the work thread stack area, in bytes.
- `prio` – initial thread priority
- `cfg` – optional additional configuration parameters. Pass `NULL` if not required, to use the defaults documented in [k\\_work\\_queue\\_config](#).

`static inline k_tid_t k_work_queue_thread_get(struct k\_work\_q *queue)`

Access the thread that animates a work queue.

This is necessary to grant a work queue thread access to things the work items it will process are expected to use.

##### Parameters

- `queue` – pointer to the queue structure.

**Returns** the thread associated with the work queue.

`int k_work_queue_drain(struct k\_work\_q *queue, bool plug)`

Wait until the work queue has drained, optionally plugging it.

This blocks submission to the work queue except when coming from queue thread, and blocks the caller until no more work items are available in the queue.

If `plug` is true then submission will continue to be blocked after the drain operation completes until `k_work_queue_unplug()` is invoked.

Note that work items that are delayed are not yet associated with their work queue. They must be cancelled externally if a goal is to ensure the work queue remains empty. The `plug` feature can be used to prevent delayed items from being submitted after the drain completes.

#### Parameters

- `queue` – pointer to the queue structure.
- `plug` – if true the work queue will continue to block new submissions after all items have drained.

#### Return values

- 1 – if call had to wait for the drain to complete
- 0 – if call did not have to wait
- negative – if wait was interrupted or failed

int `k_work_queue_unplug`(struct `k_work_q` \*queue)

Release a work queue to accept new submissions.

This releases the block on new submissions placed when `k_work_queue_drain()` is invoked with the `plug` option enabled. If this is invoked before the drain completes new items may be submitted as soon as the drain completes.

#### Function properties (list may not be complete) *isr-ok*

##### Parameters

- `queue` – pointer to the queue structure.

##### Return values

- 0 – if successfully unplugged
- `-EALREADY` – if the work queue was not plugged.

void `k_work_init_delayable`(struct `k_work_delayable` \*dwork, `k_work_handler_t` handler)

Initialize a delayable work structure.

This must be invoked before scheduling a delayable work structure for the first time. It need not be invoked again on the same work structure. It can be re-invoked to change the associated handler, but this must be done when the work item is idle.

#### Function properties (list may not be complete) *isr-ok*

##### Parameters

- `dwork` – the delayable work structure to be initialized.
- `handler` – the handler to be invoked by the work item.

static inline struct `k_work_delayable` \*`k_work_delayable_from_work`(struct `k_work` \*work)

Get the parent delayable work structure from a work pointer.

This function is necessary when a `k_work_handler_t` function is passed to `k_work_schedule_for_queue()` and the handler needs to access data from the container of the containing `k_work_delayable`.

##### Parameters

- `work` – Address passed to the work handler

**Returns** Address of the containing `k_work_delayable` structure.

`int k_work_delayable_busy_get(const struct k_work_delayable *dwork)`

Busy state flags from the delayable work item.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** This is a live snapshot of state, which may change before the result can be inspected. Use locks where appropriate.

---

#### Parameters

- `dwork` – pointer to the delayable work item.

**Returns** a mask of flags `K_WORK_DELAYED`, `K_WORK_QUEUED`, `K_WORK_RUNNING`, and `K_WORK_CANCELING`. A zero return value indicates the work item appears to be idle.

`static inline bool k_work_delayable_is_pending(const struct k_work_delayable *dwork)`

Test whether a delayed work item is currently pending.

Wrapper to determine whether a delayed work item is in a non-idle state.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** This is a live snapshot of state, which may change before the result can be inspected. Use locks where appropriate.

---

#### Parameters

- `dwork` – pointer to the delayable work item.

**Returns** true if and only if `k_work_delayable_busy_get()` returns a non-zero value.

`static inline k_ticks_t k_work_delayable_expires_get(const struct k_work_delayable *dwork)`

Get the absolute tick count at which a scheduled delayable work will be submitted.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** This is a live snapshot of state, which may change before the result can be inspected. Use locks where appropriate.

---

#### Parameters

- `dwork` – pointer to the delayable work item.

**Returns** the tick count when the timer that will schedule the work item will expire, or the current tick count if the work is not scheduled.

static inline [k\\_ticks\\_t](#) k\_work\_delayable\_remaining\_get(const struct [k\\_work\\_delayable](#) \*dwork)  
Get the number of ticks until a scheduled delayable work will be submitted.

**Function properties (list may not be complete)** [isr-ok](#)

---

**Note:** This is a live snapshot of state, which may change before the result can be inspected. Use locks where appropriate.

---

#### Parameters

- dwork – pointer to the delayable work item.

**Returns** the number of ticks until the timer that will schedule the work item will expire, or zero if the item is not scheduled.

int k\_work\_schedule\_for\_queue(struct [k\\_work\\_q](#) \*queue, struct [k\\_work\\_delayable](#) \*dwork,  
[k\\_timeout\\_t](#) delay)

Submit an idle work item to a queue after a delay.

Unlike [k\\_work\\_reschedule\\_for\\_queue\(\)](#) this is a no-op if the work item is already scheduled or submitted, even if delay is K\_NO\_WAIT.

**Function properties (list may not be complete)** [isr-ok](#)

#### Parameters

- queue – the queue on which the work item should be submitted after the delay.
- dwork – pointer to the delayable work item.
- delay – the time to wait before submitting the work item. If K\_NO\_WAIT and the work is not pending this is equivalent to [k\\_work\\_submit\\_to\\_queue\(\)](#).

#### Return values

- 0 – if work was already scheduled or submitted.
- 1 – if work has been scheduled.
- -EBUSY – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.
- -EINVAL – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.
- -ENODEV – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.

int k\_work\_schedule(struct [k\\_work\\_delayable](#) \*dwork, [k\\_timeout\\_t](#) delay)

Submit an idle work item to the system work queue after a delay.

This is a thin wrapper around [k\\_work\\_schedule\\_for\\_queue\(\)](#), with all the API characteristics of that function.

#### Parameters

- dwork – pointer to the delayable work item.
- delay – the time to wait before submitting the work item. If K\_NO\_WAIT this is equivalent to [k\\_work\\_submit\\_to\\_queue\(\)](#).

**Returns** as with [k\\_work\\_schedule\\_for\\_queue\(\)](#).

```
int k_work_reschedule_for_queue(struct k_work_q *queue, struct k_work_delayable *dwork,  
                               k_timeout_t delay)
```

Reschedule a work item to a queue after a delay.

Unlike [k\\_work\\_schedule\\_for\\_queue\(\)](#) this function can change the deadline of a scheduled work item, and will schedule a work item that isn't idle (e.g. is submitted or running). This function does not affect ("unsubmit") a work item that has been submitted to a queue.

#### Function properties (list may not be complete) *isr-ok*

---

**Note:** If delay is K\_NO\_WAIT ("no delay") the return values are as with [k\\_work\\_submit\\_to\\_queue\(\)](#).

---

##### Parameters

- queue – the queue on which the work item should be submitted after the delay.
- dwork – pointer to the delayable work item.
- delay – the time to wait before submitting the work item. If K\_NO\_WAIT this is equivalent to [k\\_work\\_submit\\_to\\_queue\(\)](#) after canceling any previous scheduled submission.

##### Return values

- 0 – if delay is K\_NO\_WAIT and work was already on a queue
- 1 – if
  - delay is K\_NO\_WAIT and work was not submitted but has now been queued to queue; or
  - delay not K\_NO\_WAIT and work has been scheduled
- 2 – if delay is K\_NO\_WAIT and work was running and has been queued to the queue that was running it
- -EBUSY – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.
- -EINVAL – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.
- -ENODEV – if delay is K\_NO\_WAIT and [k\\_work\\_submit\\_to\\_queue\(\)](#) fails with this code.

```
int k_work_reschedule(struct k_work_delayable *dwork, k_timeout_t delay)
```

Reschedule a work item to the system work queue after a delay.

This is a thin wrapper around [k\\_work\\_reschedule\\_for\\_queue\(\)](#), with all the API characteristics of that function.

##### Parameters

- dwork – pointer to the delayable work item.
- delay – the time to wait before submitting the work item.

**Returns** as with [k\\_work\\_reschedule\\_for\\_queue\(\)](#).

```
bool k_work_flush_delayable(struct k_work_delayable *dwork, struct k_work_sync *sync)
```

Flush delayable work.

If the work is scheduled, it is immediately submitted. Then the caller blocks until the work completes, as with [k\\_work\\_flush\(\)](#).

---

**Note:** Be careful of caller and work queue thread relative priority. If this function sleeps it will not return until the work queue thread completes the tasks that allow this thread to resume.

---

---

**Note:** Behavior is undefined if this function is invoked on `dwork` from a work queue running `dwork`.

---

#### Parameters

- `dwork` – pointer to the delayable work item.
- `sync` – pointer to an opaque item containing state related to the pending cancellation. The object must persist until the call returns, and be accessible from both the caller thread and the work queue thread. The object must not be used for any other flush or cancel operation until this one completes. On architectures with `CONFIG_KERNEL_COHERENCE` the object must be allocated in coherent memory.

#### Return values

- `true` – if call had to wait for completion
- `false` – if work was already idle

```
int k_work_cancel_delayable(struct k_work_delayable *dwork)
```

Cancel delayable work.

Similar to [k\\_work\\_cancel\(\)](#) but for delayable work. If the work is scheduled or submitted it is canceled. This function does not wait for the cancellation to complete.

#### Function properties (list may not be complete) *isr-ok*

---

**Note:** The work may still be running when this returns. Use [k\\_work\\_flush\\_delayable\(\)](#) or [k\\_work\\_cancel\\_delayable\\_sync\(\)](#) to ensure it is not running.

---

---

**Note:** Canceling delayable work does not prevent rescheduling it. It does prevent submitting it until the cancellation completes.

---

#### Parameters

- `dwork` – pointer to the delayable work item.

**Returns** the [k\\_work\\_delayable\\_busy\\_get\(\)](#) status indicating the state of the item after all cancellation steps performed by this call are completed.

```
bool k_work_cancel_delayable_sync(struct k_work_delayable *dwork, struct k_work_sync *sync)
```

Cancel delayable work and wait.

Like [k\\_work\\_cancel\\_delayable\(\)](#) but waits until the work becomes idle.

---

**Note:** Canceling delayable work does not prevent rescheduling it. It does prevent submitting it until the cancellation completes.

---

---

**Note:** Be careful of caller and work queue thread relative priority. If this function sleeps it will not return until the work queue thread completes the tasks that allow this thread to resume.

---

---

**Note:** Behavior is undefined if this function is invoked on `dwork` from a work queue running `dwork`.

---

### Parameters

- `dwork` – pointer to the delayable work item.
- `sync` – pointer to an opaque item containing state related to the pending cancellation. The object must persist until the call returns, and be accessible from both the caller thread and the work queue thread. The object must not be used for any other flush or cancel operation until this one completes. On architectures with `CONFIG_KERNEL_COHERENCE` the object must be allocated in coherent memory.

### Return values

- `true` – if work was not idle (call had to wait for cancellation of a running handler to complete, or scheduled or submitted operations were cancelled);
- `false` – otherwise

```
static inline bool k_work_pending(const struct k_work *work)

static inline void k_work_q_start(struct k_work_q *work_q, k_thread_stack_t *stack, size_t
                                stack_size, int prio)

static inline void k_delayed_work_init(struct k_delayed_work *work, k_work_handler_t
                                      handler)

static inline int k_delayed_work_submit_to_queue(struct k_work_q *work_q, struct
                                                k_delayed_work *work, k_timeout_t delay)

static inline int k_delayed_work_submit(struct k_delayed_work *work, k_timeout_t delay)

static inline int k_delayed_work_cancel(struct k_delayed_work *work)

static inline bool k_delayed_work_pending(struct k_delayed_work *work)

static inline int32_t k_delayed_work_remaining_get(struct k_delayed_work *work)

static inline k_ticks_t k_delayed_work_expires_ticks(struct k_delayed_work *work)

static inline k_ticks_t k_delayed_work_remaining_ticks(struct k_delayed_work *work)

static inline void k_work_user_init(struct k_work_user *work, k_work_user_handler_t handler)
    Initialize a userspace work item.
```

This routine initializes a user workqueue work item, prior to its first use.

### Parameters

- `work` – Address of work item.
- `handler` – Function to invoke each time work item is processed.

**Returns** N/A

```
static inline bool k_work_user_is_pending(struct k_work_user *work)
```

Check if a userspace work item is pending.

This routine indicates if user work item *work* is pending in a workqueue's queue.

**Function properties (list may not be complete)** [isr-ok](#)

---

**Note:** Checking if the work is pending gives no guarantee that the work will still be pending when this information is used. It is up to the caller to make sure that this information is used in a safe manner.

---

#### Parameters

- *work* – Address of work item.

**Returns** true if work item is pending, or false if it is not pending.

```
static inline int k_work_user_submit_to_queue(struct k_work_user_q *work_q, struct
                                             k_work_user *work)
```

Submit a work item to a user mode workqueue.

Submits a work item to a workqueue that runs in user mode. A temporary memory allocation is made from the caller's resource pool which is freed once the worker thread consumes the [k\\_work](#) item. The workqueue thread must have memory access to the [k\\_work](#) item being submitted. The caller must have permission granted on the *work\_q* parameter's queue object.

**Function properties (list may not be complete)** [isr-ok](#)

#### Parameters

- *work\_q* – Address of workqueue.
- *work* – Address of work item.

#### Return values

- -EBUSY – if the work item was already in some workqueue
- -ENOMEM – if no memory for thread resource pool allocation
- 0 – Success

```
void k_work_user_queue_start(struct k_work_user_q *work_q, k_thread_stack_t *stack, size_t
                             stack_size, int prio, const char *name)
```

Start a workqueue in user mode.

This works identically to [k\\_work\\_queue\\_start\(\)](#) except it is callable from user mode, and the worker thread created will run in user mode. The caller must have permissions granted on both the *work\_q* parameter's thread and queue objects, and the same restrictions on priority apply as [k\\_thread\\_create\(\)](#).

#### Parameters

- *work\_q* – Address of workqueue.
- *stack* – Pointer to work queue thread's stack space, as defined by [K\\_THREAD\\_STACK\\_DEFINE\(\)](#)
- *stack\_size* – Size of the work queue thread's stack (in bytes), which should either be the same constant passed to [K\\_THREAD\\_STACK\\_DEFINE\(\)](#) or the value of [K\\_THREAD\\_STACK\\_SIZEOF\(\)](#).

- `prio` – Priority of the work queue’s thread.
- `name` – optional thread name. If not null a copy is made into the thread’s name buffer.

**Returns** N/A

`void k_work_poll_init(struct k_work_poll *work, k\_work\_handler\_t handler)`

Initialize a triggered work item.

This routine initializes a workqueue triggered work item, prior to its first use.

**Parameters**

- `work` – Address of triggered work item.
- `handler` – Function to invoke each time work item is processed.

**Returns** N/A

`int k_work_poll_submit_to_queue(struct k\_work\_q *work_q, struct k_work_poll *work, struct k\_poll\_event *events, int num_events, k\_timeout\_t timeout)`

Submit a triggered work item.

This routine schedules work item `work` to be processed by workqueue `work_q` when one of the given `events` is signaled. The routine initiates internal poller for the work item and then returns to the caller. Only when one of the watched events happen the work item is actually submitted to the workqueue and becomes pending.

Submitting a previously submitted triggered work item that is still waiting for the event cancels the existing submission and reschedules it the using the new event list. Note that this behavior is inherently subject to race conditions with the pre-existing triggered work item and work queue, so care must be taken to synchronize such resubmissions externally.

**Function properties (list may not be complete)** [isr-ok](#)

**Warning:** Provided array of events as well as a triggered work item must be placed in persistent memory (valid until work handler execution or work cancellation) and cannot be modified after submission.

**Parameters**

- `work_q` – Address of workqueue.
- `work` – Address of delayed work item.
- `events` – An array of events which trigger the work.
- `num_events` – The number of events in the array.
- `timeout` – Timeout after which the work will be scheduled for execution even if not triggered.

**Return values**

- 0 – Work item started watching for events.
- -EINVAL – Work item is being processed or has completed its work.
- -EADDRINUSE – Work item is pending on a different workqueue.

`int k_work_poll_submit(struct k_work_poll *work, struct k\_poll\_event *events, int num_events, k\_timeout\_t timeout)`

Submit a triggered work item to the system workqueue.

This routine schedules work item *work* to be processed by system workqueue when one of the given *events* is signaled. The routine initiates internal poller for the work item and then returns to the caller. Only when one of the watched events happen the work item is actually submitted to the workqueue and becomes pending.

Submitting a previously submitted triggered work item that is still waiting for the event cancels the existing submission and reschedules it the using the new event list. Note that this behavior is inherently subject to race conditions with the pre-existing triggered work item and work queue, so care must be taken to synchronize such resubmissions externally.

**Function properties (list may not be complete)** [isr-ok](#)

**Warning:** Provided array of events as well as a triggered work item must not be modified until the item has been processed by the workqueue.

#### Parameters

- *work* – Address of delayed work item.
- *events* – An array of events which trigger the work.
- *num\_events* – The number of events in the array.
- *timeout* – Timeout after which the work will be scheduled for execution even if not triggered.

#### Return values

- 0 – Work item started watching for events.
- -EINVAL – Work item is being processed or has completed its work.
- -EADDRINUSE – Work item is pending on a different workqueue.

`int k_work_poll_cancel(struct k_work_poll *work)`

Cancel a triggered work item.

This routine cancels the submission of triggered work item *work*. A triggered work item can only be canceled if no event triggered work submission.

**Function properties (list may not be complete)** [isr-ok](#)

#### Parameters

- *work* – Address of delayed work item.

#### Return values

- 0 – Work item canceled.
- -EINVAL – Work item is being processed or has completed its work.

`struct k_work`

*#include <kernel.h>* A structure used to submit work.

`struct k_work_delayable`

*#include <kernel.h>* A structure used to submit work after a delay.

struct k\_work\_sync

*#include <kernel.h>* A structure holding internal state for a pending synchronous operation on a work item or queue.

Instances of this type are provided by the caller for invocation of [k\\_work\\_flush\(\)](#), [k\\_work\\_cancel\\_sync\(\)](#) and sibling flush and cancel APIs. A referenced object must persist until the call returns, and be accessible from both the caller thread and the work queue thread.

---

**Note:** If CONFIG\_KERNEL\_COHERENCE is enabled the object must be allocated in coherent memory; see [arch\\_mem\\_coherent\(\)](#). The stack on these architectures is generally not coherent. be stack-allocated. Violations are detected by runtime assertion.

---

struct k\_work\_queue\_config

*#include <kernel.h>* A structure holding optional configuration items for a work queue.

This structure, and values it references, are not retained by [k\\_work\\_queue\\_start\(\)](#).

### Public Members

const char \*name

The name to be given to the work queue thread.

If left null the thread will not have a name.

bool no\_yield

Control whether the work queue thread should yield between items.

Yielding between items helps guarantee the work queue thread does not starve other threads, including cooperative ones released by a work item. This is the default behavior.

Set this to true to prevent the work queue thread from yielding between items. This may be appropriate when a sequence of items should complete without yielding control.

struct k\_work\_q

*#include <kernel.h>* A structure used to hold work until it can be processed.

struct k\_delayed\_work

*#include <kernel.h>*

## Zephyr Without Threads

Thread support is not necessary in some applications:

- Bootloaders
- Simple event-driven applications
- Examples intended to demonstrate core functionality

Thread support can be disabled in Zephyr by setting **:kconfig: `CONFIG\_MULTITHREADING`** to n. Since this configuration has a significant impact on Zephyr's functionality and testing of it has been limited, there are conditions on what can be expected to work in this configuration.

**What Can be Expected to Work** These core capabilities shall function correctly when `:kconfig: `CONFIG_MULTITHREADING`` is disabled:

- The *build system*
- The ability to boot the application to `main()`
- *Interrupt management*
- The system clock including `k_uptime_get()`
- Timers, i.e. `k_timer()`
- Non-sleeping delays e.g. `k_busy_wait()`.
- Sleeping `k_cpu_idle()`.
- Pre `main()` drivers and subsystems initialization e.g. `SYS_INIT`.
- *Memory Management*
- Specifically identified drivers in certain subsystems, listed below.

The expectations above affect selection of other features; for example `:kconfig: `CONFIG_SYS_CLOCK_EXISTS`` cannot be set to n.

**What Cannot be Expected to Work** Functionality that will not work with `:kconfig: `CONFIG_MULTITHREADING`` includes majority of the kernel API:

- *Threads*
- *Scheduling*
- *Workqueue Threads*
- *Polling API*
- *Semaphores*
- *Mutexes*
- *Condition Variables*
- *Data Passing*

**Subsystem Behavior Without Thread Support** The sections below list driver and functional subsystems that are expected to work to some degree when `:kconfig: `CONFIG_MULTITHREADING`` is disabled. Subsystems that are not listed here should not be expected to work.

Some existing drivers within the listed subsystems do not work when threading is disabled, but are within scope based on their subsystem, or may be sufficiently isolated that supporting them on a particular platform is low-impact. Enhancements to add support to existing capabilities that were not originally implemented to work with threads disabled will be considered.

**Flash** The *Flash* is expected to work for all SoC flash peripheral drivers. Bus-accessed devices like serial memories may not be supported.

*List/table of supported drivers to go here*

**GPIO** The *GPIO* is expected to work for all SoC GPIO peripheral drivers. Bus-accessed devices like GPIO extenders may not be supported.

*List/table of supported drivers to go here*

**UART** A subset of the [UART](#) is expected to work for all SoC UART peripheral drivers.

- Applications that select `:kconfig: `CONFIG_UART_INTERRUPT_DRIVEN`` may work, depending on driver implementation.
- Applications that select `:kconfig: `CONFIG_UART_ASYNC_API`` may work, depending on driver implementation.
- Applications that do not select either `:kconfig: `CONFIG_UART_ASYNC_API`` or `:kconfig: `CONFIG_UART_INTERRUPT_DRIVEN`` are expected to work.

*List/table of supported drivers to go here, including which API options are supported*

## Interrupts

An *interrupt service routine* (ISR) is a function that executes asynchronously in response to a hardware or software interrupt. An ISR normally preempts the execution of the current thread, allowing the response to occur with very low overhead. Thread execution resumes only once all ISR work has been completed.

- [Concepts](#)
  - [Multi-level Interrupt handling](#)
  - [Preventing Interruptions](#)
  - [Offloading ISR Work](#)
- [Implementation](#)
  - [Defining a regular ISR](#)
  - [Defining a ‘direct’ ISR](#)
  - [Implementation Details](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of ISRs can be defined (limited only by available RAM), subject to the constraints imposed by underlying hardware.

An ISR has the following key properties:

- An **interrupt request (IRQ) signal** that triggers the ISR.
- A **priority level** associated with the IRQ.
- An **interrupt handler function** that is invoked to handle the interrupt.
- An **argument value** that is passed to that function.

An IDT (Interrupt Descriptor Table) or a vector table is used to associate a given interrupt source with a given ISR. Only a single ISR can be associated with a specific IRQ at any given time.

Multiple ISRs can utilize the same function to process interrupts, allowing a single function to service a device that generates multiple types of interrupts or to service multiple devices (usually of the same type). The argument value passed to an ISR’s function allows the function to determine which interrupt has been signaled.

The kernel provides a default ISR for all unused IDT entries. This ISR generates a fatal system error if an unexpected interrupt is signaled.

The kernel supports **interrupt nesting**. This allows an ISR to be preempted in mid-execution if a higher priority interrupt is signaled. The lower priority ISR resumes execution once the higher priority ISR has completed its processing.

An ISR's interrupt handler function executes in the kernel's **interrupt context**. This context has its own dedicated stack area (or, on some architectures, stack areas). The size of the interrupt context stack must be capable of handling the execution of multiple concurrent ISRs if interrupt nesting support is enabled.

---

**Important:** Many kernel APIs can be used only by threads, and not by ISRs. In cases where a routine may be invoked by both threads and ISRs the kernel provides the `k_is_in_isr()` API to allow the routine to alter its behavior depending on whether it is executing as part of a thread or as part of an ISR.

---

**Multi-level Interrupt handling** A hardware platform can support more interrupt lines than natively-provided through the use of one or more nested interrupt controllers. Sources of hardware interrupts are combined into one line that is then routed to the parent controller.

If nested interrupt controllers are supported, `:kconfig: `CONFIG_MULTI_LEVEL_INTERRUPTS`` should be set to 1, and `:kconfig: `CONFIG_2ND_LEVEL_INTERRUPTS`` and `:kconfig: `CONFIG_3RD_LEVEL_INTERRUPTS`` configured as well, based on the hardware architecture.

A unique 32-bit interrupt number is assigned with information embedded in it to select and invoke the correct Interrupt Service Routine (ISR). Each interrupt level is given a byte within this 32-bit number, providing support for up to four interrupt levels using this arch, as illustrated and explained below:

There are three interrupt levels shown here.

- ‘-’ means interrupt line and is numbered from 0 (right most).
- LEVEL 1 has 12 interrupt lines, with two lines (2 and 9) connected to nested controllers and one device ‘A’ on line 4.
- One of the LEVEL 2 controllers has interrupt line 5 connected to a LEVEL 3 nested controller and one device ‘C’ on line 3.
- The other LEVEL 2 controller has no nested controllers but has one device ‘B’ on line 2.
- The LEVEL 3 controller has one device ‘D’ on line 2.

Here’s how unique interrupt numbers are generated for each hardware interrupt. Let’s consider four interrupts shown above as A, B, C, and D:

```

A -> 0x00000004
B -> 0x00000302
C -> 0x00000409
D -> 0x00030609
  
```

---

**Note:** The bit positions for LEVEL 2 and onward are offset by 1, as 0 means that interrupt number is not present for that level. For our example, the LEVEL 3 controller has device D on line 2, connected to the LEVEL 2 controller’s line 5, that is connected to the LEVEL 1 controller’s line 9 (2 -> 5 -> 9). Because of the encoding offset for LEVEL 2 and onward, device D is given the number 0x00030609.

---

**Preventing Interruptions** In certain situations it may be necessary for the current thread to prevent ISRs from executing while it is performing time-sensitive or critical section operations.

A thread may temporarily prevent all IRQ handling in the system using an **IRQ lock**. This lock can be applied even when it is already in effect, so routines can use it without having to know if it is already in effect. The thread must unlock its IRQ lock the same number of times it was locked before interrupts can be once again processed by the kernel while the thread is running.

---

**Important:** The IRQ lock is thread-specific. If thread A locks out interrupts then performs an operation that puts itself to sleep (e.g. sleeping for N milliseconds), the thread's IRQ lock no longer applies once thread A is swapped out and the next ready thread B starts to run.

This means that interrupts can be processed while thread B is running unless thread B has also locked out interrupts using its own IRQ lock. (Whether interrupts can be processed while the kernel is switching between two threads that are using the IRQ lock is architecture-specific.)

When thread A eventually becomes the current thread once again, the kernel re-establishes thread A's IRQ lock. This ensures thread A won't be interrupted until it has explicitly unlocked its IRQ lock.

If thread A does not sleep but does make a higher-priority thread B ready, the IRQ lock will inhibit any preemption that would otherwise occur. Thread B will not run until the next *reschedule point* reached after releasing the IRQ lock.

---

Alternatively, a thread may temporarily **disable** a specified IRQ so its associated ISR does not execute when the IRQ is signaled. The IRQ must be subsequently **enabled** to permit the ISR to execute.

---

**Important:** Disabling an IRQ prevents *all* threads in the system from being preempted by the associated ISR, not just the thread that disabled the IRQ.

---

**Zero Latency Interrupts** Preventing interruptions by applying an IRQ lock may increase the observed interrupt latency. A high interrupt latency, however, may not be acceptable for certain low-latency use-cases.

The kernel addresses such use-cases by allowing interrupts with critical latency constraints to execute at a priority level that cannot be blocked by interrupt locking. These interrupts are defined as *zero-latency interrupts*. The support for zero-latency interrupts requires `:kconfig: `CONFIG_ZERO_LATENCY_IRQS`` to be enabled. In addition to that, the flag `IRQ_ZERO_LATENCY` must be passed to `IRQ_CONNECT` or `IRQ_DIRECT_CONNECT` macros to configure the particular interrupt with zero latency.

Zero-latency interrupts are expected to be used to manage hardware events directly, and not to inter-operate with the kernel code at all. They should treat all kernel APIs as undefined behavior (i.e. an application that uses the APIs inside a zero-latency interrupt context is responsible for directly verifying correct behavior). Zero-latency interrupts may not modify any data inspected by kernel APIs invoked from normal Zephyr contexts and shall not generate exceptions that need to be handled synchronously (e.g. kernel panic).

---

**Important:** Zero-latency interrupts are supported on an architecture-specific basis. The feature is currently implemented in the ARM Cortex-M architecture variant.

---

**Offloading ISR Work** An ISR should execute quickly to ensure predictable system operation. If time consuming processing is required the ISR should offload some or all processing to a thread, thereby restoring the kernel's ability to respond to other interrupts.

The kernel supports several mechanisms for offloading interrupt-related processing to a thread.

- An ISR can signal a helper thread to do interrupt-related processing using a kernel object, such as a FIFO, LIFO, or semaphore.

- An ISR can instruct the system workqueue thread to execute a work item. (See [Workqueue Threads](#).)

When an ISR offloads work to a thread, there is typically a single context switch to that thread when the ISR completes, allowing interrupt-related processing to continue almost immediately. However, depending on the priority of the thread handling the offload, it is possible that the currently executing cooperative thread or other higher-priority threads may execute before the thread handling the offload is scheduled.

## Implementation

**Defining a regular ISR** An ISR is defined at runtime by calling [IRQ\\_CONNECT](#). It must then be enabled by calling [irq\\_enable\(\)](#).

---

**Important:** `IRQ_CONNECT()` is not a C function and does some inline assembly magic behind the scenes. All its arguments must be known at build time. Drivers that have multiple instances may need to define per-instance config functions to configure each instance of the interrupt.

---

The following code defines and enables an ISR.

```
#define MY_DEV_IRQ 24      /* device uses IRQ 24 */
#define MY_DEV_PRIO 2     /* device uses interrupt priority 2 */
/* argument passed to my_isr(), in this case a pointer to the device */
#define MY_ISR_ARG DEVICE_GET(my_device)
#define MY_IRQ_FLAGS 0    /* IRQ flags */

void my_isr(void *arg)
{
    ... /* ISR code */
}

void my_isr_installer(void)
{
    ...
    IRQ_CONNECT(MY_DEV_IRQ, MY_DEV_PRIO, my_isr, MY_ISR_ARG, MY_IRQ_FLAGS);
    irq_enable(MY_DEV_IRQ);
    ...
}
```

Since the [IRQ\\_CONNECT](#) macro requires that all its parameters be known at build time, in some cases this may not be acceptable. It is also possible to install interrupts at runtime with [irq\\_connect\\_dynamic\(\)](#). It is used in exactly the same way as [IRQ\\_CONNECT](#):

```
void my_isr_installer(void)
{
    ...
    irq_connect_dynamic(MY_DEV_IRQ, MY_DEV_PRIO, my_isr, MY_ISR_ARG,
                       MY_IRQ_FLAGS);
    irq_enable(MY_DEV_IRQ);
    ...
}
```

Dynamic interrupts require the `:kconfig: CONFIG_DYNAMIC_INTERRUPTS` option to be enabled. Removing or re-configuring a dynamic interrupt is currently unsupported.

**Defining a ‘direct’ ISR** Regular Zephyr interrupts introduce some overhead which may be unacceptable for some low-latency use-cases. Specifically:

- The argument to the ISR is retrieved and passed to the ISR
- If power management is enabled and the system was idle, all the hardware will be resumed from low-power state before the ISR is executed, which can be very time-consuming
- Although some architectures will do this in hardware, other architectures need to switch to the interrupt stack in code
- After the interrupt is serviced, the OS then performs some logic to potentially make a scheduling decision.

Zephyr supports so-called ‘direct’ interrupts, which are installed via [IRQ\\_DIRECT\\_CONNECT](#). These direct interrupts have some special implementation requirements and a reduced feature set; see the definition of [IRQ\\_DIRECT\\_CONNECT](#) for details.

The following code demonstrates a direct ISR:

```
#define MY_DEV_IRQ 24      /* device uses IRQ 24 */
#define MY_DEV_PRIO 2     /* device uses interrupt priority 2 */
/* argument passed to my_isr(), in this case a pointer to the device */
#define MY_IRQ_FLAGS 0    /* IRQ flags */

ISR_DIRECT_DECLARE(my_isr)
{
    do_stuff();
    ISR_DIRECT_PM(); /* PM done after servicing interrupt for best latency */
    return 1; /* We should check if scheduling decision should be made */
}

void my_isr_installer(void)
{
    ...
    IRQ_DIRECT_CONNECT(MY_DEV_IRQ, MY_DEV_PRIO, my_isr, MY_IRQ_FLAGS);
    irq_enable(MY_DEV_IRQ);
    ...
}
```

Installation of dynamic direct interrupts is supported on an architecture-specific basis. (The feature is currently implemented in ARM Cortex-M architecture variant. Dynamic direct interrupts feature is exposed to the user via an ARM-only API.)

**Implementation Details** Interrupt tables are set up at build time using some special build tools. The details laid out here apply to all architectures except x86, which are covered in the [x86 Details](#) section below.

Any invocation of [IRQ\\_CONNECT](#) will declare an instance of struct `_isr_list` which is placed in a special `.intList` section:

```
struct _isr_list {
    /** IRQ line number */
    int32_t irq;
    /** Flags for this IRQ, see ISR_FLAG_* definitions */
    int32_t flags;
    /** ISR to call */
    void *func;
    /** Parameter for non-direct IRQs */
    void *param;
};
```

Zephyr is built in two phases; the first phase of the build produces `${ZEPHYR_PREBUILT_EXECUTABLE}.elf` which contains all the entries in the `.intList` section preceded by a header:

```

struct {
    void *spurious_irq_handler;
    void *sw_irq_handler;
    uint32_t num_isrs;
    uint32_t num_vectors;
    struct _isr_list isrs[]; <- of size num_isrs
};

```

This data consisting of the header and instances of struct `_isr_list` inside `$(ZEPHYR_PREBUILT_EXECUTABLE).elf` is then used by the `gen_isr_tables.py` script to generate a C file defining a vector table and software ISR table that are then compiled and linked into the final application.

The priority level of any interrupt is not encoded in these tables, instead `IRQ_CONNECT` also has a runtime component which programs the desired priority level of the interrupt to the interrupt controller. Some architectures do not support the notion of interrupt priority, in which case the priority argument is ignored.

**Vector Table** A vector table is generated when `:kconfig: `CONFIG_GEN_IRQ_VECTOR_TABLE`` is enabled. This data structure is used natively by the CPU and is simply an array of function pointers, where each element `n` corresponds to the IRQ handler for IRQ line `n`, and the function pointers are:

1. For 'direct' interrupts declared with `IRQ_DIRECT_CONNECT`, the handler function will be placed here.
2. For regular interrupts declared with `IRQ_CONNECT`, the address of the common software IRQ handler is placed here. This code does common kernel interrupt bookkeeping and looks up the ISR and parameter from the software ISR table.
3. For interrupt lines that are not configured at all, the address of the spurious IRQ handler will be placed here. The spurious IRQ handler causes a system fatal error if encountered.

Some architectures (such as the Nios II internal interrupt controller) have a common entry point for all interrupts and do not support a vector table, in which case the `:kconfig: `CONFIG_GEN_IRQ_VECTOR_TABLE`` option should be disabled.

Some architectures may reserve some initial vectors for system exceptions and declare this in a table elsewhere, in which case `CONFIG_GEN_IRQ_START_VECTOR` needs to be set to properly offset the indices in the table.

**SW ISR Table** This is an array of struct `_isr_table_entry`:

```

struct _isr_table_entry {
    void *arg;
    void (*isr)(void *);
};

```

This is used by the common software IRQ handler to look up the ISR and its argument and execute it. The active IRQ line is looked up in an interrupt controller register and used to index this table.

**x86 Details** The x86 architecture has a special type of vector table called the Interrupt Descriptor Table (IDT) which must be laid out in a certain way per the x86 processor documentation. It is still fundamentally a vector table, and the `arch/x86/gen_idt.py` tool uses the `.intList` section to create it. However, on APIC-based systems the indexes in the vector table do not correspond to the IRQ line. The first 32 vectors are reserved for CPU exceptions, and all remaining vectors (up to index 255) correspond to the priority level, in groups of 16. In this scheme, interrupts of priority level 0 will be placed in vectors 32-47, level 1 48-63, and so forth. When the `arch/x86/gen_idt.py` tool is constructing the IDT, when it configures an interrupt it will look for a free vector in the appropriate range for the requested priority level and set the handler there.

On x86 when an interrupt or exception vector is executed by the CPU, there is no foolproof way to determine which vector was fired, so a software ISR table indexed by IRQ line is not used. Instead, the `IRQ_CONNECT` call creates a small assembly language function which calls the common interrupt code in `_interrupt_enter()` with the ISR and parameter as arguments. It is the address of this assembly interrupt stub which gets placed in the IDT. For interrupts declared with `IRQ_DIRECT_CONNECT` the parameterless ISR is placed directly in the IDT.

On systems where the position in the vector table corresponds to the interrupt's priority level, the interrupt controller needs to know at runtime what vector is associated with an IRQ line. `arch/x86/gen_idt.py` additionally creates an `_irq_to_interrupt_vector` array which maps an IRQ line to its configured vector in the IDT. This is used at runtime by `IRQ_CONNECT` to program the IRQ-to-vector association in the interrupt controller.

For dynamic interrupts, the build must generate some 4-byte dynamic interrupt stubs, one stub per dynamic interrupt in use. The number of stubs is controlled by the `:kconfig: CONFIG_X86_DYNAMIC_IRQ_STUBS` option. Each stub pushes an unique identifier which is then used to fetch the appropriate handler function and parameter out of a table populated when the dynamic interrupt was connected.

**Suggested Uses** Use a regular or direct ISR to perform interrupt processing that requires a very rapid response, and can be done quickly without blocking.

---

**Note:** Interrupt processing that is time consuming, or involves blocking, should be handed off to a thread. See [Offloading ISR Work](#) for a description of various techniques that can be used in an application.

---

**Configuration Options** Related configuration options:

- `:kconfig: CONFIG_ISR_STACK_SIZE`

Additional architecture-specific and device-specific configuration options also exist.

## API Reference

group `isr_apis`

### Defines

`IRQ_CONNECT(irq_p, priority_p, isr_p, isr_param_p, flags_p)`

Initialize an interrupt handler.

This routine initializes an interrupt handler for an IRQ. The IRQ must be subsequently enabled before the interrupt handler begins servicing interrupts.

**Warning:** Although this routine is invoked at run-time, all of its arguments must be computable by the compiler at build time.

### Parameters

- `irq_p` – IRQ line number.
- `priority_p` – Interrupt priority.
- `isr_p` – Address of interrupt service routine.
- `isr_param_p` – Parameter passed to interrupt service routine.
- `flags_p` – Architecture-specific IRQ configuration flags..

`IRQ_DIRECT_CONNECT(irq_p, priority_p, isr_p, flags_p)`

Initialize a ‘direct’ interrupt handler.

This routine initializes an interrupt handler for an IRQ. The IRQ must be subsequently enabled via [irq\\_enable\(\)](#) before the interrupt handler begins servicing interrupts.

These ISRs are designed for performance-critical interrupt handling and do not go through common interrupt handling code. They must be implemented in such a way that it is safe to put them directly in the vector table. For ISRs written in C, The [ISR\\_DIRECT\\_DECLARE\(\)](#) macro will do this automatically. For ISRs written in assembly it is entirely up to the developer to ensure that the right steps are taken.

This type of interrupt currently has a few limitations compared to normal Zephyr interrupts:

- No parameters are passed to the ISR.
- No stack switch is done, the ISR will run on the interrupted context’s stack, unless the architecture automatically does the stack switch in HW.
- Interrupt locking state is unchanged from how the HW sets it when the ISR runs. On arches that enter ISRs with interrupts locked, they will remain locked.
- Scheduling decisions are now optional, controlled by the return value of ISRs implemented with the [ISR\\_DIRECT\\_DECLARE\(\)](#) macro
- The call into the OS to exit power management idle state is now optional. Normal interrupts always do this before the ISR is run, but when it runs is now controlled by the placement of a [ISR\\_DIRECT\\_PM\(\)](#) macro, or omitted entirely.

**Warning:** Although this routine is invoked at run-time, all of its arguments must be computable by the compiler at build time.

#### Parameters

- `irq_p` – IRQ line number.
- `priority_p` – Interrupt priority.
- `isr_p` – Address of interrupt service routine.
- `flags_p` – Architecture-specific IRQ configuration flags.

`ISR_DIRECT_HEADER()`

Common tasks before executing the body of an ISR.

This macro must be at the beginning of all direct interrupts and performs minimal architecture-specific tasks before the ISR itself can run. It takes no arguments and has no return value.

`ISR_DIRECT_FOOTER(check_reschedule)`

Common tasks before exiting the body of an ISR.

This macro must be at the end of all direct interrupts and performs minimal architecture-specific tasks like EOI. It has no return value.

In a normal interrupt, a check is done at end of interrupt to invoke `z_swap()` logic if the current thread is preemptible and there is another thread ready to run in the kernel’s ready queue cache. This is now optional and controlled by the `check_reschedule` argument. If unsure, set to nonzero. On systems that do stack switching and nested interrupt tracking in software, `z_swap()` should only be called if this was a non-nested interrupt.

#### Parameters

- `check_reschedule` – If nonzero, additionally invoke scheduling logic

**ISR\_DIRECT\_PM()**

Perform power management idle exit logic.

This macro may optionally be invoked somewhere in between `IRQ_DIRECT_HEADER()` and `IRQ_DIRECT_FOOTER()` invocations. It performs tasks necessary to exit power management idle state. It takes no parameters and returns no arguments. It may be omitted, but be careful!

**ISR\_DIRECT\_DECLARE(name)**

Helper macro to declare a direct interrupt service routine.

This will declare the function in a proper way and automatically include the [ISR\\_DIRECT\\_FOOTER\(\)](#) and [ISR\\_DIRECT\\_HEADER\(\)](#) macros. The function should return nonzero status if a scheduling decision should potentially be made. See [ISR\\_DIRECT\\_FOOTER\(\)](#) for more details on the scheduling decision.

For architectures that support ‘regular’ and ‘fast’ interrupt types, where these interrupt types require different assembly language handling of registers by the ISR, this will always generate code for the ‘fast’ interrupt type.

Example usage:

```
ISR_DIRECT_DECLARE(my_isr)
{
    bool done = do_stuff();
    ISR_DIRECT_PM(); // done after do_stuff() due to latency concerns
    if (!done) {
        return 0; // don't bother checking if we have to z_swap()
    }

    k_sem_give(some_sem);
    return 1;
}
```

**Parameters**

- name – symbol name of the ISR

**irq\_lock()**

Lock interrupts.

This routine disables all interrupts on the CPU. It returns an unsigned integer “lock-out key”, which is an architecture-dependent indicator of whether interrupts were locked prior to the call. The lock-out key must be passed to [irq\\_unlock\(\)](#) to re-enable interrupts.

This routine can be called recursively, as long as the caller keeps track of each lock-out key that is generated. Interrupts are re-enabled by passing each of the keys to [irq\\_unlock\(\)](#) in the reverse order they were acquired. (That is, each call to [irq\\_lock\(\)](#) must be balanced by a corresponding call to [irq\\_unlock\(\)](#).)

This routine can only be invoked from supervisor mode. Some architectures (for example, ARM) will fail silently if invoked from user mode instead of generating an exception.

---

**Note:** This routine must also serve as a memory barrier to ensure the uniprocessor implementation of `k_spinlock_t` is correct.

---

---

**Note:** This routine can be called by ISRs or by threads. If it is called by a thread, the interrupt lock is thread-specific; this means that interrupts remain disabled only while the thread is running. If the thread performs an operation that allows another thread to run

(for example, giving a semaphore or sleeping for N milliseconds), the interrupt lock no longer applies and interrupts may be re-enabled while other processing occurs. When the thread once again becomes the current thread, the kernel re-establishes its interrupt lock; this ensures the thread won't be interrupted until it has explicitly released the interrupt lock it established.

---

**Warning:** The lock-out key should never be used to manually re-enable interrupts or to inspect or manipulate the contents of the CPU's interrupt bits.

**Returns** An architecture-dependent lock-out key representing the “interrupt disable state” prior to the call.

`irq_unlock(key)`

Unlock interrupts.

This routine reverses the effect of a previous call to `irq_lock()` using the associated lock-out key. The caller must call the routine once for each time it called `irq_lock()`, supplying the keys in the reverse order they were acquired, before interrupts are enabled.

This routine can only be invoked from supervisor mode. Some architectures (for example, ARM) will fail silently if invoked from user mode instead of generating an exception.

---

**Note:** This routine must also serve as a memory barrier to ensure the uniprocessor implementation of `k_spinlock_t` is correct.

---

---

**Note:** Can be called by ISRs.

---

#### Parameters

- `key` – Lock-out key generated by `irq_lock()`.

**Returns** N/A

`irq_enable(irq)`

Enable an IRQ.

This routine enables interrupts from source `irq`.

#### Parameters

- `irq` – IRQ line.

**Returns** N/A

`irq_disable(irq)`

Disable an IRQ.

This routine disables interrupts from source `irq`.

#### Parameters

- `irq` – IRQ line.

**Returns** N/A

`irq_is_enabled(irq)`

Get IRQ enable state.

This routine indicates if interrupts from source `irq` are enabled.

**Parameters**

- `irq` – IRQ line.

**Returns** interrupt enable state, true or false

**Functions**

```
static inline int irq_connect_dynamic(unsigned int irq, unsigned int priority, void
                                     (*routine)(const void *parameter), const void *parameter,
                                     uint32_t flags)
```

Configure a dynamic interrupt.

Use this instead of [IRQ\\_CONNECT\(\)](#) if arguments cannot be known at build time.

**Parameters**

- `irq` – IRQ line number
- `priority` – Interrupt priority
- `routine` – Interrupt service routine
- `parameter` – ISR parameter
- `flags` – Arch-specific IRQ configuration flags

**Returns** The vector assigned to this interrupt

```
static inline unsigned int irq_get_level(unsigned int irq)
```

```
bool k_is_in_isr(void)
```

Determine if code is running at interrupt level.

This routine allows the caller to customize its actions, depending on whether it is a thread or an ISR.

**Function properties (list may not be complete)** *isr-ok*

**Returns** false if invoked by a thread.

**Returns** true if invoked by an ISR.

```
int k_is_preempt_thread(void)
```

Determine if code is running in a preemptible thread.

This routine allows the caller to customize its actions, depending on whether it can be preempted by another thread. The routine returns a ‘true’ value if all of the following conditions are met:

- The code is running in a thread, not at ISR.
- The thread’s priority is in the preemptible range.
- The thread has not locked the scheduler.

**Function properties (list may not be complete)** *isr-ok*

**Returns** 0 if invoked by an ISR or by a cooperative thread.

**Returns** Non-zero if invoked by a preemptible thread.

```
static inline bool k_is_pre_kernel(void)
```

Test whether startup is in the before-main-task phase.

This routine allows the caller to customize its actions, depending on whether it being invoked before the kernel is fully active.

**Function properties (list may not be complete)** *isr-ok*

**Returns** true if invoked before post-kernel initialization

**Returns** false if invoked during/after post-kernel initialization

## Polling API

The polling API is used to wait concurrently for any one of multiple conditions to be fulfilled.

- [Concepts](#)
- [Implementation](#)
  - [Using `k\_poll\(\)`](#)
  - [Using `k\_poll\_signal\_raise\(\)`](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** The polling API's main function is `k_poll()`, which is very similar in concept to the POSIX `poll()` function, except that it operates on kernel objects rather than on file descriptors.

The polling API allows a single thread to wait concurrently for one or more conditions to be fulfilled without actively looking at each one individually.

There is a limited set of such conditions:

- a semaphore becomes available
- a kernel FIFO contains data ready to be retrieved
- a poll signal is raised

A thread that wants to wait on multiple conditions must define an array of **poll events**, one for each condition.

All events in the array must be initialized before the array can be polled on.

Each event must specify which **type** of condition must be satisfied so that its state is changed to signal the requested condition has been met.

Each event must specify what **kernel object** it wants the condition to be satisfied.

Each event must specify which **mode** of operation is used when the condition is satisfied.

Each event can optionally specify a **tag** to group multiple events together, to the user's discretion.

Apart from the kernel objects, there is also a **poll signal** pseudo-object type that be directly signaled.

The `k_poll()` function returns as soon as one of the conditions it is waiting for is fulfilled. It is possible for more than one to be fulfilled when `k_poll()` returns, if they were fulfilled before `k_poll()` was called, or due to the preemptive multi-threading nature of the kernel. The caller must look at the state of all the poll events in the array to figure out which ones were fulfilled and what actions to take.

Currently, there is only one mode of operation available: the object is not acquired. As an example, this means that when `k_poll()` returns and the poll event states that the semaphore is available, the caller of `k_poll()` must then invoke `k_sem_take()` to take ownership of the semaphore. If the semaphore is contested, there is no guarantee that it will be still available when `k_sem_give()` is called.

## Implementation

**Using `k_poll()`** The main API is `k_poll()`, which operates on an array of poll events of type `k_poll_event`. Each entry in the array represents one event a call to `k_poll()` will wait for its condition to be fulfilled.

They can be initialized using either the runtime initializers `K_POLL_EVENT_INITIALIZER()` or `k_poll_event_init()`, or the static initializer `K_POLL_EVENT_STATIC_INITIALIZER()`. An object that matches the **type** specified must be passed to the initializers. The **mode** must be set to `K_POLL_MODE_NOTIFY_ONLY`. The state must be set to `K_POLL_STATE_NOT_READY` (the initializers take care of this). The user **tag** is optional and completely opaque to the API: it is there to help a user to group similar events together. Being optional, it is passed to the static initializer, but not the runtime ones for performance reasons. If using runtime initializers, the user must set it separately in the `k_poll_event` data structure. If an event in the array is to be ignored, most likely temporarily, its type can be set to `K_POLL_TYPE_IGNORE`.

```
struct k_poll_event events[2] = {
    K_POLL_EVENT_STATIC_INITIALIZER(K_POLL_TYPE_SEM_AVAILABLE,
                                    K_POLL_MODE_NOTIFY_ONLY,
                                    &my_sem, 0),
    K_POLL_EVENT_STATIC_INITIALIZER(K_POLL_TYPE_FIFO_DATA_AVAILABLE,
                                    K_POLL_MODE_NOTIFY_ONLY,
                                    &my_fifo, 0),
};
```

or at runtime

```
struct k_poll_event events[2];
void some_init(void)
{
    k_poll_event_init(&events[0],
                     K_POLL_TYPE_SEM_AVAILABLE,
                     K_POLL_MODE_NOTIFY_ONLY,
                     &my_sem);

    k_poll_event_init(&events[1],
                     K_POLL_TYPE_FIFO_DATA_AVAILABLE,
                     K_POLL_MODE_NOTIFY_ONLY,
                     &my_fifo);

    // tags are left uninitialized if unused
}
```

After the events are initialized, the array can be passed to `k_poll()`. A timeout can be specified to wait only for a specified amount of time, or the special values `K_NO_WAIT` and `K_FOREVER` to either not wait or wait until an event condition is satisfied and not sooner.

A list of pollers is offered on each semaphore or FIFO and as many events can wait in it as the app wants. Notice that the waiters will be served in first-come-first-serve order, not in priority order.

In case of success, `k_poll()` returns 0. If it times out, it returns `-EAGAIN`.

```

// assume there is no contention on this semaphore and FIFO
// -EADDRINUSE will not occur; the semaphore and/or data will be available

void do_stuff(void)
{
    rc = k_poll(events, 2, 1000);
    if (rc == 0) {
        if (events[0].state == K_POLL_STATE_SEM_AVAILABLE) {
            k_sem_take(events[0].sem, 0);
        } else if (events[1].state == K_POLL_STATE_FIFO_DATA_AVAILABLE) {
            data = k_fifo_get(events[1].fifo, 0);
            // handle data
        }
    } else {
        // handle timeout
    }
}

```

When `k_poll()` is called in a loop, the events state must be reset to `K_POLL_STATE_NOT_READY` by the user.

```

void do_stuff(void)
{
    for(;;) {
        rc = k_poll(events, 2, K_FOREVER);
        if (events[0].state == K_POLL_STATE_SEM_AVAILABLE) {
            k_sem_take(events[0].sem, 0);
        } else if (events[1].state == K_POLL_STATE_FIFO_DATA_AVAILABLE) {
            data = k_fifo_get(events[1].fifo, 0);
            // handle data
        }
        events[0].state = K_POLL_STATE_NOT_READY;
        events[1].state = K_POLL_STATE_NOT_READY;
    }
}

```

**Using `k_poll_signal_raise()`** One of the types of events is `K_POLL_TYPE_SIGNAL`: this is a “direct” signal to a poll event. This can be seen as a lightweight binary semaphore only one thread can wait for.

A poll signal is a separate object of type `k_poll_signal` that must be attached to a `k_poll_event`, similar to a semaphore or FIFO. It must first be initialized either via `K_POLL_SIGNAL_INITIALIZER()` or `k_poll_signal_init()`.

```

struct k_poll_signal signal;
void do_stuff(void)
{
    k_poll_signal_init(&signal);
}

```

It is signaled via the `k_poll_signal_raise()` function. This function takes a user **result** parameter that is opaque to the API and can be used to pass extra information to the thread waiting on the event.

```

struct k_poll_signal signal;

// thread A
void do_stuff(void)
{

```

(continues on next page)

(continued from previous page)

```

k_poll_signal_init(&signal);

struct k_poll_event events[1] = {
    K_POLL_EVENT_INITIALIZER(K_POLL_TYPE_SIGNAL,
                             K_POLL_MODE_NOTIFY_ONLY,
                             &signal),
};

k_poll(events, 1, K_FOREVER);

if (events.signal->result == 0x1337) {
    // A-OK!
} else {
    // weird error
}
}

// thread B
void signal_do_stuff(void)
{
    k_poll_signal_raise(&signal, 0x1337);
}

```

If the signal is to be polled in a loop, *both* its event state and its **signaled** field *must* be reset on each iteration if it has been signaled.

```

struct k_poll_signal signal;
void do_stuff(void)
{
    k_poll_signal_init(&signal);

    struct k_poll_event events[1] = {
        K_POLL_EVENT_INITIALIZER(K_POLL_TYPE_SIGNAL,
                                 K_POLL_MODE_NOTIFY_ONLY,
                                 &signal),
    };

    for (;;) {
        k_poll(events, 1, K_FOREVER);

        if (events[0].signal->result == 0x1337) {
            // A-OK!
        } else {
            // weird error
        }

        events[0].signal->signaled = 0;
        events[0].state = K_POLL_STATE_NOT_READY;
    }
}

```

**Suggested Uses** Use `k_poll()` to consolidate multiple threads that would be pending on one object each, saving possibly large amounts of stack space.

Use a poll signal as a lightweight binary semaphore if only one thread pends on it.

---

**Note:** Because objects are only signaled if no other thread is waiting for them to become available and only one thread can poll on a specific object, polling is best used when objects are not subject of contention between multiple threads, basically when a single thread operates as a main “server” or “dispatcher” for multiple objects and is the only one trying to acquire these objects.

## Functions

void k\_poll\_event\_init(struct [k\\_poll\\_event](#) \*event, uint32\_t type, int mode, void \*obj)

Initialize one struct [k\\_poll\\_event](#) instance.

After this routine is called on a poll event, the event is ready to be placed in an event array to be passed to [k\\_poll\(\)](#).

### Parameters

- `event` – The event to initialize.
- `type` – A bitfield of the types of event, from the `K_POLL_TYPE_XXX` values. Only values that apply to the same object being polled can be used together. Choosing `K_POLL_TYPE_IGNORE` disables the event.
- `mode` – Future. Use `K_POLL_MODE_NOTIFY_ONLY`.
- `obj` – Kernel object or poll signal.

### Returns

 N/A

int k\_poll(struct [k\\_poll\\_event](#) \*events, int num\_events, [k\\_timeout\\_t](#) timeout)

Wait for one or many of multiple poll events to occur.

This routine allows a thread to wait concurrently for one or many of multiple poll events to have occurred. Such events can be a kernel object being available, like a semaphore, or a poll signal event.

When an event notifies that a kernel object is available, the kernel object is not “given” to the thread calling [k\\_poll\(\)](#): it merely signals the fact that the object was available when the [k\\_poll\(\)](#) call was in effect. Also, all threads trying to acquire an object the regular way, i.e. by pending on the object, have precedence over the thread polling on the object. This means that the polling thread will never get the poll event on an object until the object becomes available and its pend queue is empty. For this reason, the [k\\_poll\(\)](#) call is more effective when the objects being polled only have one thread, the polling thread, trying to acquire them.

When [k\\_poll\(\)](#) returns 0, the caller should loop on all the events that were passed to [k\\_poll\(\)](#) and check the state field for the values that were expected and take the associated actions.

Before being reused for another call to [k\\_poll\(\)](#), the user has to reset the state field to `K_POLL_STATE_NOT_READY`.

When called from user mode, a temporary memory allocation is required from the caller’s resource pool.

### Parameters

- `events` – An array of events to be polled for.
- `num_events` – The number of events in the array.
- `timeout` – Waiting period for an event to be ready, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Return values**

- 0 – One or more events are ready.
- -EAGAIN – Waiting period timed out.
- -EINTR – Polling has been interrupted, e.g. with [k\\_queue\\_cancel\\_wait\(\)](#). All output events are still set and valid, cancelled event(s) will be set to K\_POLL\_STATE\_CANCELLED. In other words, -EINTR status means that at least one of output events is K\_POLL\_STATE\_CANCELLED.
- -ENOMEM – Thread resource pool insufficient memory (user mode only)
- -EINVAL – Bad parameters (user mode only)

void [k\\_poll\\_signal\\_init](#)(struct [k\\_poll\\_signal](#) \*sig)

Initialize a poll signal object.

Ready a poll signal object to be signaled via [k\\_poll\\_signal\\_raise\(\)](#).

**Parameters**

- sig – A poll signal.

**Returns** N/A

void [k\\_poll\\_signal\\_reset](#)(struct [k\\_poll\\_signal](#) \*sig)

void [k\\_poll\\_signal\\_check](#)(struct [k\\_poll\\_signal](#) \*sig, unsigned int \*signaled, int \*result)

Fetch the signaled state and result value of a poll signal.

**Parameters**

- sig – A poll signal object
- signaled – An integer buffer which will be written nonzero if the object was signaled
- result – An integer destination buffer which will be written with the result value if the object was signaled, or an undefined value if it was not.

int [k\\_poll\\_signal\\_raise](#)(struct [k\\_poll\\_signal](#) \*sig, int result)

Signal a poll signal object.

This routine makes ready a poll signal, which is basically a poll event of type K\_POLL\_TYPE\_SIGNAL. If a thread was polling on that event, it will be made ready to run. A *result* value can be specified.

The poll signal contains a ‘signaled’ field that, when set by [k\\_poll\\_signal\\_raise\(\)](#), stays set until the user sets it back to 0 with [k\\_poll\\_signal\\_reset\(\)](#). It thus has to be reset by the user before being passed again to [k\\_poll\(\)](#) or [k\\_poll\(\)](#) will consider it being signaled, and will return immediately.

---

**Note:** The result is stored and the ‘signaled’ field is set even if this function returns an error indicating that an expiring poll was not notified. The next [k\\_poll\(\)](#) will detect the missed raise.

---

**Parameters**

- sig – A poll signal.
- result – The value to store in the result field of the signal.

**Return values**

- 0 – The signal was delivered successfully.
- -EAGAIN – The polling thread’s timeout is in the process of expiring.

```
struct k_poll_signal
    #include <kernel.h>
```

## Semaphores

A *semaphore* is a kernel object that implements a traditional counting semaphore.

- [Concepts](#)
- [Implementation](#)

- [Defining a Semaphore](#)
- [Giving a Semaphore](#)
- [Taking a Semaphore](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)
- [User Mode Semaphore API Reference](#)

**Concepts** Any number of semaphores can be defined (limited only by available RAM). Each semaphore is referenced by its memory address.

A semaphore has the following key properties:

- A **count** that indicates the number of times the semaphore can be taken. A count of zero indicates that the semaphore is unavailable.
- A **limit** that indicates the maximum value the semaphore's count can reach.

A semaphore must be initialized before it can be used. Its count must be set to a non-negative value that is less than or equal to its limit.

A semaphore may be **given** by a thread or an ISR. Giving the semaphore increments its count, unless the count is already equal to the limit.

A semaphore may be **taken** by a thread. Taking the semaphore decrements its count, unless the semaphore is unavailable (i.e. at zero). When a semaphore is unavailable a thread may choose to wait for it to be given. Any number of threads may wait on an unavailable semaphore simultaneously. When the semaphore is given, it is taken by the highest priority thread that has waited longest.

---

**Note:** The kernel does allow an ISR to take a semaphore, however the ISR must not attempt to wait if the semaphore is unavailable.

---

## Implementation

**Defining a Semaphore** A semaphore is defined using a variable of type `k_sem`. It must then be initialized by calling `k_sem_init()`.

The following code defines a semaphore, then configures it as a binary semaphore by setting its count to 0 and its limit to 1.

```
struct k_sem my_sem;

k_sem_init(&my_sem, 0, 1);
```

Alternatively, a semaphore can be defined and initialized at compile time by calling `K_SEM_DEFINE`.

The following code has the same effect as the code segment above.

```
K_SEM_DEFINE(my_sem, 0, 1);
```

**Giving a Semaphore** A semaphore is given by calling `k_sem_give()`.

The following code builds on the example above, and gives the semaphore to indicate that a unit of data is available for processing by a consumer thread.

```
void input_data_interrupt_handler(void *arg)
{
    /* notify thread that data is available */
    k_sem_give(&my_sem);

    ...
}
```

**Taking a Semaphore** A semaphore is taken by calling `k_sem_take()`.

The following code builds on the example above, and waits up to 50 milliseconds for the semaphore to be given. A warning is issued if the semaphore is not obtained in time.

```
void consumer_thread(void)
{
    ...

    if (k_sem_take(&my_sem, K_MSEC(50)) != 0) {
        printk("Input data not available!");
    } else {
        /* fetch available data */
        ...
    }
    ...
}
```

**Suggested Uses** Use a semaphore to control access to a set of resources by multiple threads.

Use a semaphore to synchronize processing between a producing and consuming threads or ISRs.

**Configuration Options** Related configuration options:

- None.

## API Reference

group semaphore\_apis

### Defines

K\_SEM\_MAX\_LIMIT

Maximum limit value allowed for a semaphore.

This is intended for use when a semaphore does not have an explicit maximum limit, and instead is just used for counting purposes.

K\_SEM\_DEFINE(name, initial\_count, count\_limit)

Statically define and initialize a semaphore.

The semaphore can be accessed outside the module where it is defined using:

```
extern struct k_sem <name>;
```

**Parameters**

- `name` – Name of the semaphore.
- `initial_count` – Initial semaphore count.
- `count_limit` – Maximum permitted semaphore count.

**Functions**

`int k_sem_init(struct k_sem *sem, unsigned int initial_count, unsigned int limit)`

Initialize a semaphore.

This routine initializes a semaphore object, prior to its first use.

**See also:**

[\*K\\_SEM\\_MAX\\_LIMIT\*](#)

**Parameters**

- `sem` – Address of the semaphore.
- `initial_count` – Initial semaphore count.
- `limit` – Maximum permitted semaphore count.

**Return values**

- 0 – Semaphore created successfully
- -EINVAL – Invalid values

`int k_sem_take(struct k_sem *sem, k\_timeout\_t timeout)`

Take a semaphore.

This routine takes *sem*.

**Function properties (list may not be complete)** [\*isr-ok\*](#)

---

**Note:** *timeout* must be set to K\_NO\_WAIT if called from ISR.

---

**Parameters**

- `sem` – Address of the semaphore.
- `timeout` – Waiting period to take the semaphore, or one of the special values K\_NO\_WAIT and K\_FOREVER.

**Return values**

- 0 – Semaphore taken.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out, or the semaphore was reset during the waiting period.

```
void k_sem_give(struct k_sem *sem)
```

Give a semaphore.

This routine gives *sem*, unless the semaphore is already at its maximum permitted count.

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- *sem* – Address of the semaphore.

**Returns** N/A

```
void k_sem_reset(struct k_sem *sem)
```

Resets a semaphore's count to zero.

This routine sets the count of *sem* to zero. Any outstanding semaphore takes will be aborted with -EAGAIN.

**Parameters**

- *sem* – Address of the semaphore.

**Returns** N/A

```
unsigned int k_sem_count_get(struct k_sem *sem)
```

Get a semaphore's count.

This routine returns the current count of *sem*.

**Parameters**

- *sem* – Address of the semaphore.

**Returns** Current semaphore count.

**User Mode Semaphore API Reference** The `sys_sem` exists in user memory working as counter semaphore for user mode thread when user mode enabled. When user mode isn't enabled, `sys_sem` behaves like `k_sem`.

*group* `user_semaphore_apis`

**Defines**

```
SYS_SEM_DEFINE(_name, _initial_count, _count_limit)
```

Statically define and initialize a `sys_sem`.

The semaphore can be accessed outside the module where it is defined using:

```
extern struct sys_sem <name>;
```

Route this to memory domains using `K_APP_DMEM()`.

**Parameters**

- *\_name* – Name of the semaphore.
- *\_initial\_count* – Initial semaphore count.
- *\_count\_limit* – Maximum permitted semaphore count.

## Functions

`int sys_sem_init(struct sys_sem *sem, unsigned int initial_count, unsigned int limit)`

Initialize a semaphore.

This routine initializes a semaphore instance, prior to its first use.

### Parameters

- `sem` – Address of the semaphore.
- `initial_count` – Initial semaphore count.
- `limit` – Maximum permitted semaphore count.

### Return values

- 0 – Initial success.
- -EINVAL – Bad parameters, the value of `limit` should be located in (0, INT\_MAX] and `initial_count` shouldn't be greater than `limit`.

`int sys_sem_give(struct sys_sem *sem)`

Give a semaphore.

This routine gives `sem`, unless the semaphore is already at its maximum permitted count.

### Parameters

- `sem` – Address of the semaphore.

### Return values

- 0 – Semaphore given.
- -EINVAL – Parameter address not recognized.
- -EACCES – Caller does not have enough access.
- -EAGAIN – Count reached Maximum permitted count and try again.

`int sys_sem_take(struct sys_sem *sem, k_timeout_t timeout)`

Take a `sys_sem`.

This routine takes `sem`.

### Parameters

- `sem` – Address of the `sys_sem`.
- `timeout` – Waiting period to take the `sys_sem`, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

### Return values

- 0 – `sys_sem` taken.
- -EINVAL – Parameter address not recognized.
- -ETIMEDOUT – Waiting period timed out.
- -EACCES – Caller does not have enough access.

`unsigned int sys_sem_count_get(struct sys_sem *sem)`

Get `sys_sem`'s value.

This routine returns the current value of `sem`.

### Parameters

- `sem` – Address of the `sys_sem`.

**Returns** Current value of `sys_sem`.

## Mutexes

A *mutex* is a kernel object that implements a traditional reentrant mutex. A mutex allows multiple threads to safely share an associated hardware or software resource by ensuring mutually exclusive access to the resource.

- [Concepts](#)
  - [Reentrant Locking](#)
  - [Priority Inheritance](#)
- [Implementation](#)
  - [Defining a Mutex](#)
  - [Locking a Mutex](#)
  - [Unlocking a Mutex](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)
- [Futex API Reference](#)
- [User Mode Mutex API Reference](#)

**Concepts** Any number of mutexes can be defined (limited only by available RAM). Each mutex is referenced by its memory address.

A mutex has the following key properties:

- A **lock count** that indicates the number of times the mutex has been locked by the thread that has locked it. A count of zero indicates that the mutex is unlocked.
- An **owning thread** that identifies the thread that has locked the mutex, when it is locked.

A mutex must be initialized before it can be used. This sets its lock count to zero.

A thread that needs to use a shared resource must first gain exclusive rights to access it by **locking** the associated mutex. If the mutex is already locked by another thread, the requesting thread may choose to wait for the mutex to be unlocked.

After locking a mutex, the thread may safely use the associated resource for as long as needed; however, it is considered good practice to hold the lock for as short a time as possible to avoid negatively impacting other threads that want to use the resource. When the thread no longer needs the resource it must **unlock** the mutex to allow other threads to use the resource.

Any number of threads may wait on a locked mutex simultaneously. When the mutex becomes unlocked it is then locked by the highest-priority thread that has waited the longest.

---

**Note:** Mutex objects are *not* designed for use by ISRs.

---

**Reentrant Locking** A thread is permitted to lock a mutex it has already locked. This allows the thread to access the associated resource at a point in its execution when the mutex may or may not already be locked.

A mutex that is repeatedly locked by a thread must be unlocked an equal number of times before the mutex becomes fully unlocked so it can be claimed by another thread.

**Priority Inheritance** The thread that has locked a mutex is eligible for *priority inheritance*. This means the kernel will *temporarily* elevate the thread's priority if a higher priority thread begins waiting on the mutex. This allows the owning thread to complete its work and release the mutex more rapidly by executing at the same priority as the waiting thread. Once the mutex has been unlocked, the unlocking thread resets its priority to the level it had before locking that mutex.

---

**Note:** The `:kconfig: `CONFIG_PRIORITY_CEILING`` configuration option limits how high the kernel can raise a thread's priority due to priority inheritance. The default value of 0 permits unlimited elevation.

---

When two or more threads wait on a mutex held by a lower priority thread, the kernel adjusts the owning thread's priority each time a thread begins waiting (or gives up waiting). When the mutex is eventually unlocked, the unlocking thread's priority correctly reverts to its original non-elevated priority.

The kernel does *not* fully support priority inheritance when a thread holds two or more mutexes simultaneously. This situation can result in the thread's priority not reverting to its original non-elevated priority when all mutexes have been released. It is recommended that a thread lock only a single mutex at a time when multiple mutexes are shared between threads of different priorities.

## Implementation

**Defining a Mutex** A mutex is defined using a variable of type `k_mutex`. It must then be initialized by calling `k_mutex_init()`.

The following code defines and initializes a mutex.

```
struct k_mutex my_mutex;

k_mutex_init(&my_mutex);
```

Alternatively, a mutex can be defined and initialized at compile time by calling `K_MUTEX_DEFINE`.

The following code has the same effect as the code segment above.

```
K_MUTEX_DEFINE(my_mutex);
```

**Locking a Mutex** A mutex is locked by calling `k_mutex_lock()`.

The following code builds on the example above, and waits indefinitely for the mutex to become available if it is already locked by another thread.

```
k_mutex_lock(&my_mutex, K_FOREVER);
```

The following code waits up to 100 milliseconds for the mutex to become available, and gives a warning if the mutex does not become available.

```
if (k_mutex_lock(&my_mutex, K_MSEC(100)) == 0) {
    /* mutex successfully locked */
} else {
    printf("Cannot lock XYZ display\n");
}
```

**Unlocking a Mutex** A mutex is unlocked by calling `k_mutex_unlock()`.

The following code builds on the example above, and unlocks the mutex that was previously locked by the thread.

```
k_mutex_unlock(&my_mutex);
```

**Suggested Uses** Use a mutex to provide exclusive access to a resource, such as a physical device.

**Configuration Options** Related configuration options:

- **`:kconfig: `CONFIG_PRIORITY_CEILING``**

## API Reference

*group* mutex\_api

### Defines

`K_MUTEX_DEFINE(name)`

Statically define and initialize a mutex.

The mutex can be accessed outside the module where it is defined using:

```
extern struct k_mutex <name>;
```

### Parameters

- `name` – Name of the mutex.

### Functions

`int k_mutex_init(struct k_mutex *mutex)`

Initialize a mutex.

This routine initializes a mutex object, prior to its first use.

Upon completion, the mutex is available and does not have an owner.

### Parameters

- `mutex` – Address of the mutex.

**Return values** 0 – Mutex object created

`int k_mutex_lock(struct k_mutex *mutex, k_timeout_t timeout)`

Lock a mutex.

This routine locks *mutex*. If the mutex is locked by another thread, the calling thread waits until the mutex becomes available or until a timeout occurs.

A thread is permitted to lock a mutex it has already locked. The operation completes immediately and the lock count is increased by 1.

Mutexes may not be locked in ISRs.

### Parameters

- `mutex` – Address of the mutex.
- `timeout` – Waiting period to lock the mutex, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Return values**

- 0 – Mutex locked.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.

```
int k_mutex_unlock(struct k_mutex *mutex)
```

Unlock a mutex.

This routine unlocks *mutex*. The mutex must already be locked by the calling thread.

The mutex cannot be claimed by another thread until it has been unlocked by the calling thread as many times as it was previously locked by that thread.

Mutexes may not be unlocked in ISRs, as mutexes must only be manipulated in thread context due to ownership and priority inheritance semantics.

**Parameters**

- *mutex* – Address of the mutex.

**Return values**

- 0 – Mutex unlocked.
- -EPERM – The current thread does not own the mutex
- -EINVAL – The mutex is not locked

```
struct k_mutex
```

*#include <kernel.h>* Mutex Structure

**Public Members**

```
_wait_q_t wait_q
```

Mutex wait queue

```
struct k_thread *owner
```

Mutex owner

```
uint32_t lock_count
```

Current lock count

```
int owner_orig_prio
```

Original thread priority

**Futex API Reference** *k\_futex* is a lightweight mutual exclusion primitive designed to minimize kernel involvement. Uncontended operation relies only on atomic access to shared memory. *k\_futex* are tracked as kernel objects and can live in user memory so that any access bypasses the kernel object permission management mechanism.

*group* *futex\_apis*

## Functions

`int k_futex_wait(struct k_futex *futex, int expected, k\_timeout\_t timeout)`

Pend the current thread on a futex.

Tests that the supplied futex contains the expected value, and if so, goes to sleep until some other thread calls [k\\_futex\\_wake\(\)](#) on it.

### Parameters

- `futex` – Address of the futex.
- `expected` – Expected value of the futex, if it is different the caller will not wait on it.
- `timeout` – Non-negative waiting period on the futex, or one of the special values `K_NO_WAIT` or `K_FOREVER`.

### Return values

- `-EACCES` – Caller does not have read access to futex address.
- `-EAGAIN` – If the futex value did not match the expected parameter.
- `-EINVAL` – Futex parameter address not recognized by the kernel.
- `-ETIMEDOUT` – Thread woke up due to timeout and not a futex wakeup.
- `0` – if the caller went to sleep and was woken up. The caller should check the futex's value on wakeup to determine if it needs to block again.

`int k_futex_wake(struct k_futex *futex, bool wake_all)`

Wake one/all threads pending on a futex.

Wake up the highest priority thread pending on the supplied futex, or wakeup all the threads pending on the supplied futex, and the behavior depends on `wake_all`.

### Parameters

- `futex` – Futex to wake up pending threads.
- `wake_all` – If true, wake up all pending threads; If false, wakeup the highest priority thread.

### Return values

- `-EACCES` – Caller does not have access to the futex address.
- `-EINVAL` – Futex parameter address not recognized by the kernel.
- `Number` – of threads that were woken up.

**User Mode Mutex API Reference** `sys_mutex` behaves almost exactly like `k_mutex`, with the added advantage that a `sys_mutex` instance can reside in user memory. When user mode isn't enabled, `sys_mutex` behaves like `k_mutex`.

*group* `user_mutex_apis`

## Defines

`SYS_MUTEX_DEFINE(name)`

Statically define and initialize a `sys_mutex`.

The mutex can be accessed outside the module where it is defined using:

```
extern struct sys_mutex <name>;
```

Route this to memory domains using `K_APP_DMEM()`.

#### Parameters

- `name` – Name of the mutex.

### Functions

```
static inline void sys_mutex_init(struct sys_mutex *mutex)
```

Initialize a mutex.

This routine initializes a mutex object, prior to its first use.

Upon completion, the mutex is available and does not have an owner.

This routine is only necessary to call when userspace is disabled and the mutex was not created with [SYS\\_MUTEX\\_DEFINE\(\)](#).

#### Parameters

- `mutex` – Address of the mutex.

#### Returns

N/A

```
static inline int sys_mutex_lock(struct sys_mutex *mutex, k_timeout_t timeout)
```

Lock a mutex.

This routine locks *mutex*. If the mutex is locked by another thread, the calling thread waits until the mutex becomes available or until a timeout occurs.

A thread is permitted to lock a mutex it has already locked. The operation completes immediately and the lock count is increased by 1.

#### Parameters

- `mutex` – Address of the mutex, which may reside in user memory
- `timeout` – Waiting period to lock the mutex, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

#### Return values

- 0 – Mutex locked.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.
- `-EACCES` – Caller has no access to provided mutex address
- `-EINVAL` – Provided mutex not recognized by the kernel

```
static inline int sys_mutex_unlock(struct sys_mutex *mutex)
```

Unlock a mutex.

This routine unlocks *mutex*. The mutex must already be locked by the calling thread.

The mutex cannot be claimed by another thread until it has been unlocked by the calling thread as many times as it was previously locked by that thread.

#### Parameters

- `mutex` – Address of the mutex, which may reside in user memory

#### Return values

- 0 – Mutex unlocked

- -EACCES – Caller has no access to provided mutex address
- -EINVAL – Provided mutex not recognized by the kernel or mutex wasn't locked
- -EPERM – Caller does not own the mutex

## Condition Variables

A *condition variable* is a synchronization primitive that enables threads to wait until a particular condition occurs.

- [Concepts](#)
- [Implementation](#)
  - [Defining a Condition Variable](#)
  - [Waiting on a Condition Variable](#)
  - [Signaling a Condition Variable](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of condition variables can be defined (limited only by available RAM). Each condition variable is referenced by its memory address.

To wait for a condition to become true, a thread can make use of a condition variable.

A condition variable is basically a queue of threads that threads can put themselves on when some state of execution (i.e., some condition) is not as desired (by waiting on the condition). The function `k_condvar_wait()` performs atomically the following steps;

1. Releases the last acquired mutex.
2. Puts the current thread in the condition variable queue.

Some other thread, when it changes said state, can then wake one (or more) of those waiting threads and thus allow them to continue by signaling on the condition using `k_condvar_signal()` or `k_condvar_broadcast()` then it:

1. Re-acquires the mutex previously released.
2. Returns from `k_condvar_wait()`.

A condition variable must be initialized before it can be used.

## Implementation

**Defining a Condition Variable** A condition variable is defined using a variable of type `k_condvar`. It must then be initialized by calling `k_condvar_init()`.

The following code defines a condition variable:

```
struct k_condvar my_condvar;  
  
k_condvar_init(&my_condvar);
```

Alternatively, a condition variable can be defined and initialized at compile time by calling `K_CONDVAR_DEFINE`.

The following code has the same effect as the code segment above.

```
K_CONDVAR_DEFINE(my_condvar);
```

**Waiting on a Condition Variable** A thread can wait on a condition by calling `k_condvar_wait()`.

The following code waits on the condition variable.

```
K_MUTEX_DEFINE(mutex);
K_CONDVAR_DEFINE(condvar)

void main(void)
{
    k_mutex_lock(&mutex, K_FOREVER);

    /* block this thread until another thread signals cond. While
     * blocked, the mutex is released, then re-acquired before this
     * thread is woken up and the call returns.
     */
    k_condvar_wait(&condvar, &mutex, K_FOREVER);
    ...
    k_mutex_unlock(&mutex);
}
```

**Signaling a Condition Variable** A condition variable is signaled on by calling `k_condvar_signal()` for one thread or by calling `k_condvar_broadcast()` for multiple threads.

The following code builds on the example above.

```
void worker_thread(void)
{
    k_mutex_lock(&mutex, K_FOREVER);

    /*
     * Do some work and fullfill the condition
     */
    ...
    ...
    k_condvar_signal(&condvar);
    k_mutex_unlock(&mutex);
}
```

**Suggested Uses** Use condition variables with a mutex to signal changing states (conditions) from one thread to another thread. Condition variables are not the condition itself and they are not events. The condition is contained in the surrounding programming logic.

Mutexes alone are not designed for use as a notification/synchronization mechanism. They are meant to provide mutually exclusive access to a shared resource only.

**Configuration Options** Related configuration options:

- None.

## API Reference

*group* condvar\_apis

### Defines

K\_CONDVAR\_DEFINE(name)

Statically define and initialize a condition variable.

The condition variable can be accessed outside the module where it is defined using:

```
extern struct k_condvar <name>;
```

### Parameters

- name – Name of the condition variable.

### Functions

int k\_condvar\_init(struct k\_condvar \*condvar)

Initialize a condition variable.

### Parameters

- condvar – pointer to a k\_condvar structure

**Return values** 0 – Condition variable created successfully

int k\_condvar\_signal(struct k\_condvar \*condvar)

Signals one thread that is pending on the condition variable.

### Parameters

- condvar – pointer to a k\_condvar structure

**Return values** 0 – On success

int k\_condvar\_broadcast(struct k\_condvar \*condvar)

Unblock all threads that are pending on the condition variable.

### Parameters

- condvar – pointer to a k\_condvar structure

**Returns** An integer with number of woken threads on success

int k\_condvar\_wait(struct k\_condvar \*condvar, struct [k\\_mutex](#) \*mutex, [k\\_timeout\\_t](#) timeout)

Waits on the condition variable releasing the mutex lock.

Automatically releases the currently owned mutex, blocks the current thread waiting on the condition variable specified by *condvar*, and finally acquires the mutex again.

The waiting thread unblocks only after another thread calls *k\_condvar\_signal*, or *k\_condvar\_broadcast* with the same condition variable.

### Parameters

- condvar – pointer to a k\_condvar structure
- mutex – Address of the mutex.
- timeout – Waiting period for the condition variable or one of the special values K\_NO\_WAIT and K\_FOREVER.

### Return values

- 0 – On success
- -EAGAIN – Waiting period timed out.

## Symmetric Multiprocessing

On multiprocessor architectures, Zephyr supports the use of multiple physical CPUs running Zephyr application code. This support is “symmetric” in the sense that no specific CPU is treated specially by default. Any processor is capable of running any Zephyr thread, with access to all standard Zephyr APIs supported.

No special application code needs to be written to take advantage of this feature. If there are two Zephyr application threads runnable on a supported dual processor device, they will both run simultaneously.

SMP configuration is controlled under the `:kconfig: `CONFIG_SMP`` kconfig variable. This must be set to “y” to enable SMP features, otherwise a uniprocessor kernel will be built. In general the platform default will have enabled this anywhere it’s supported. When enabled, the number of physical CPUs available is visible at build time as `:kconfig: `CONFIG_MP_NUM_CPUS``. Likewise, the default for this will be the number of available CPUs on the platform and it is not expected that typical apps will change it. But it is legal and supported to set this to a smaller (but obviously not larger) number for special purposes (e.g. for testing, or to reserve a physical CPU for running non-Zephyr code).

**Synchronization** At the application level, core Zephyr IPC and synchronization primitives all behave identically under an SMP kernel. For example semaphores used to implement blocking mutual exclusion continue to be a proper application choice.

At the lowest level, however, Zephyr code has often used the `irq_lock()/irq_unlock()` primitives to implement fine grained critical sections using interrupt masking. These APIs continue to work via an emulation layer (see below), but the masking technique does not: the fact that your CPU will not be interrupted while you are in your critical section says nothing about whether a different CPU will be running simultaneously and be inspecting or modifying the same data!

**Spinlocks** SMP systems provide a more constrained `k_spin_lock()` primitive that not only masks interrupts locally, as done by `irq_lock()`, but also atomically validates that a shared lock variable has been modified before returning to the caller, “spinning” on the check if needed to wait for the other CPU to exit the lock. The default Zephyr implementation of `k_spin_lock()` and `k_spin_unlock()` is built on top of the pre-existing `atomic_` layer (itself usually implemented using compiler intrinsics), though facilities exist for architectures to define their own for performance reasons.

One important difference between IRQ locks and spinlocks is that the earlier API was naturally recursive: the lock was global, so it was legal to acquire a nested lock inside of a critical section. Spinlocks are separable: you can have many locks for separate subsystems or data structures, preventing CPUs from contending on a single global resource. But that means that spinlocks must not be used recursively. Code that holds a specific lock must not try to re-acquire it or it will deadlock (it is perfectly legal to nest **distinct** spinlocks, however). A validation layer is available to detect and report bugs like this.

When used on a uniprocessor system, the data component of the spinlock (the atomic lock variable) is unnecessary and elided. Except for the recursive semantics above, spinlocks in single-CPU contexts produce identical code to legacy IRQ locks. In fact the entirety of the Zephyr core kernel has now been ported to use spinlocks exclusively.

**Legacy `irq_lock()` emulation** For the benefit of applications written to the uniprocessor locking API, `irq_lock()` and `irq_unlock()` continue to work compatibly on SMP systems with identical semantics to their legacy versions. They are implemented as a single global spinlock, with a nesting count and the ability to be atomically reacquired on context switch into locked threads. The kernel will ensure that only one thread across all CPUs can hold the lock at any time, that it is released on context switch, and

that it is re-acquired when necessary to restore the lock state when a thread is switched in. Other CPUs will spin waiting for the release to happen.

The overhead involved in this process has measurable performance impact, however. Unlike uniprocessor apps, SMP apps using `irq_lock()` are not simply invoking a very short (often ~1 instruction) interrupt masking operation. That, and the fact that the IRQ lock is global, means that code expecting to be run in an SMP context should be using the spinlock API wherever possible.

**CPU Mask** It is often desirable for real time applications to deliberately partition work across physical CPUs instead of relying solely on the kernel scheduler to decide on which threads to execute. Zephyr provides an API, controlled by the `:kconfig: CONFIG_SCHED_CPU_MASK` kconfig variable, which can associate a specific set of CPUs with each thread, indicating on which CPUs it can run.

By default, new threads can run on any CPU. Calling `k_thread_cpu_mask_disable()` with a particular CPU ID will prevent that thread from running on that CPU in the future. Likewise `k_thread_cpu_mask_enable()` will re-enable execution. There are also `k_thread_cpu_mask_clear()` and `k_thread_cpu_mask_enable_all()` APIs available for convenience. For obvious reasons, these APIs are illegal if called on a runnable thread. The thread must be blocked or suspended, otherwise an `-EINVAL` will be returned.

Note that when this feature is enabled, the scheduler algorithm involved in doing the per-CPU mask test requires that the list be traversed in full. The kernel does not keep a per-CPU run queue. That means that the performance benefits from the `:kconfig: CONFIG_SCHED_SCALABLE` and `:kconfig: CONFIG_SCHED_MULTIQ` scheduler backends cannot be realized. CPU mask processing is available only when `:kconfig: CONFIG_SCHED_DUMB` is the selected backend. This requirement is enforced in the configuration layer.

**SMP Boot Process** A Zephyr SMP kernel begins boot identically to a uniprocessor kernel. Auxiliary CPUs begin in a disabled state in the architecture layer. All standard kernel initialization, including device initialization, happens on a single CPU before other CPUs are brought online.

Just before entering the application `main()` function, the kernel calls `z_smp_init()` to launch the SMP initialization process. This enumerates over the configured CPUs, calling into the architecture layer using `arch_start_cpu()` for each one. This function is passed a memory region to use as a stack on the foreign CPU (in practice it uses the area that will become that CPU's interrupt stack), the address of a local `smp_init_top()` callback function to run on that CPU, and a pointer to a “start flag” address which will be used as an atomic signal.

The local SMP initialization (`smp_init_top()`) on each CPU is then invoked by the architecture layer. Note that interrupts are still masked at this point. This routine is responsible for calling `smp_timer_init()` to set up any needed stat in the timer driver. On many architectures the timer is a per-CPU device and needs to be configured specially on auxiliary CPUs. Then it waits (spinning) for the atomic “start flag” to be released in the main thread, to guarantee that all SMP initialization is complete before any Zephyr application code runs, and finally calls `z_swap()` to transfer control to the appropriate runnable thread via the standard scheduler API.

**Interprocessor Interrupts** When running in multiprocessor environments, it is occasionally the case that state modified on the local CPU needs to be synchronously handled on a different processor.

One example is the Zephyr `k_thread_abort()` API, which cannot return until the thread that had been aborted is no longer runnable. If it is currently running on another CPU, that becomes difficult to implement.

Another is low power idle. It is a firm requirement on many devices that system idle be implemented using a low-power mode with as many interrupts (including periodic timer interrupts) disabled or deferred as is possible. If a CPU is in such a state, and on another CPU a thread becomes runnable, the idle CPU has no way to “wake up” to handle the newly-runnable load.

So where possible, Zephyr SMP architectures should implement an interprocessor interrupt. The current framework is very simple: the architecture provides a `arch_sched_ipi()` call, which when invoked will

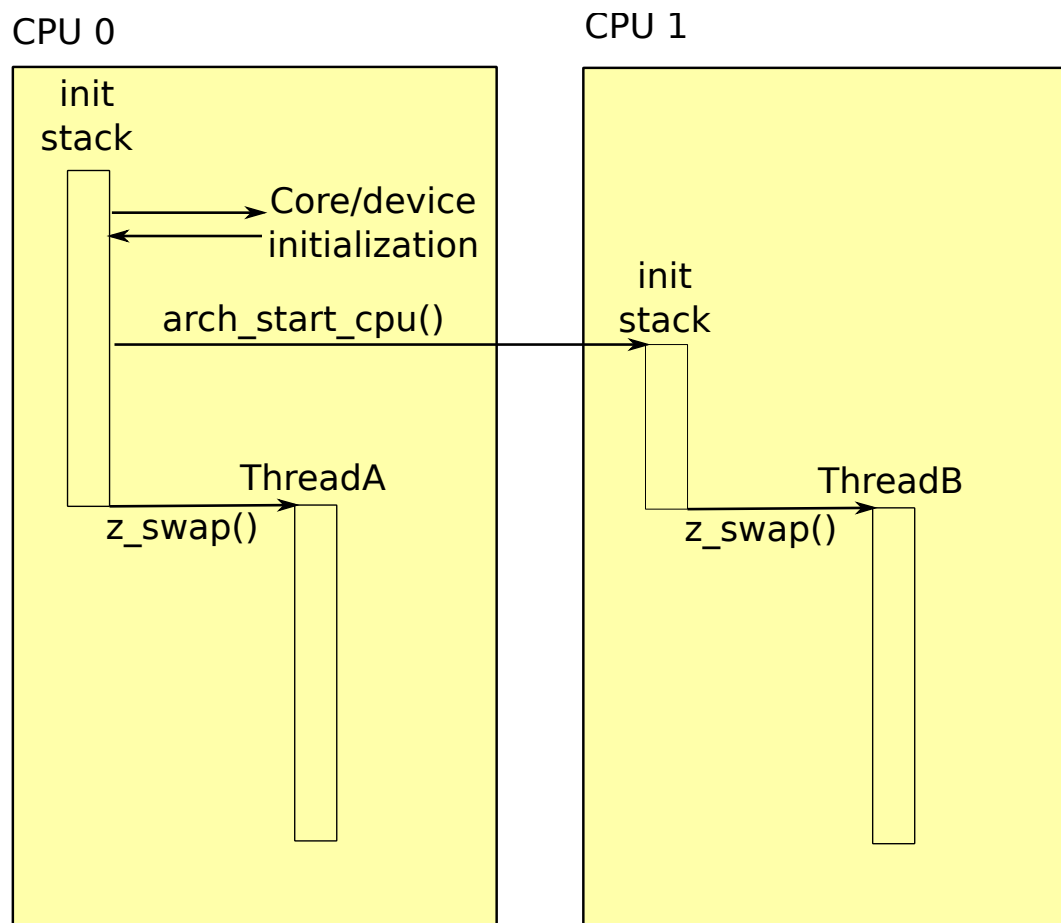

Fig. 2: Example SMP initialization process, showing a configuration with two CPUs and two app threads which begin operating simultaneously.

flag an interrupt on all CPUs (except the current one, though that is allowed behavior) which will then invoke the `z_sched_ipi()` function implemented in the scheduler. The expectation is that these APIs will evolve over time to encompass more functionality (e.g. cross-CPU calls), and that the scheduler-specific calls here will be implemented in terms of a more general framework.

Note that not all SMP architectures will have a usable IPI mechanism (either missing, or just undocumented/unimplemented). In those cases Zephyr provides fallback behavior that is correct, but perhaps suboptimal.

Using this, `k_thread_abort()` becomes only slightly more complicated in SMP: for the case where a thread is actually running on another CPU (we can detect this atomically inside the scheduler), we broadcast an IPI and spin, waiting for the thread to either become “DEAD” or for it to re-enter the queue (in which case we terminate it the same way we would have in uniprocessor mode). Note that the “aborted” check happens on any interrupt exit, so there is no special handling needed in the IPI per se. This allows us to implement a reasonable fallback when IPI is not available: we can simply spin, waiting until the foreign CPU receives any interrupt, though this may be a much longer time!

Likewise idle wakeups are trivially implementable with an empty IPI handler. If a thread is added to an empty run queue (i.e. there may have been idle CPUs), we broadcast an IPI. A foreign CPU will then be able to see the new thread when exiting from the interrupt and will switch to it if available.

Without an IPI, however, a low power idle that requires an interrupt will not work to synchronously run new threads. The workaround in that case is more invasive: Zephyr will **not** enter the system idle handler and will instead spin in its idle loop, testing the scheduler state at high frequency (not spinning on it though, as that would involve severe lock contention) for new threads. The expectation is that power constrained SMP applications are always going to provide an IPI, and this code will only be used for testing purposes or on systems without power consumption requirements.

**SMP Kernel Internals** In general, Zephyr kernel code is SMP-agnostic and, like application code, will work correctly regardless of the number of CPUs available. But in a few areas there are notable changes in structure or behavior.

**Per-CPU data** Many elements of the core kernel data need to be implemented for each CPU in SMP mode. For example, the `_current` thread pointer obviously needs to reflect what is running locally, there are many threads running concurrently. Likewise a kernel-provided interrupt stack needs to be created and assigned for each physical CPU, as does the interrupt nesting count used to detect ISR state.

These fields are now moved into a separate struct `_cpu` instance within the `_kernel` struct, which has a `cpus[]` array indexed by ID. Compatibility fields are provided for legacy uniprocessor code trying to access the fields of `cpus[0]` using the older syntax and assembly offsets.

Note that an important requirement on the architecture layer is that the pointer to this CPU struct be available rapidly when in kernel context. The expectation is that `arch_curr_cpu()` will be implemented using a CPU-provided register or addressing mode that can store this value across arbitrary context switches or interrupts and make it available to any kernel-mode code.

Similarly, where on a uniprocessor system Zephyr could simply create a global “idle thread” at the lowest priority, in SMP we may need one for each CPU. This makes the internal predicate test for “`_is_idle()`” in the scheduler, which is a hot path performance environment, more complicated than simply testing the thread pointer for equality with a known static variable. In SMP mode, idle threads are distinguished by a separate field in the thread struct.

**Switch-based context switching** The traditional Zephyr context switch primitive has been `z_swap()`. Unfortunately, this function takes no argument specifying a thread to switch to. The expectation has always been that the scheduler has already made its preemption decision when its state was last modified and cached the resulting “next thread” pointer in a location where architecture context switch primitives can find it via a simple struct offset. That technique will not work in SMP, because the other CPU may have modified scheduler state since the current CPU last exited the scheduler (for example: it might already be running that cached thread!).

Instead, the SMP “switch to” decision needs to be made synchronously with the swap call, and as we don’t want per-architecture assembly code to be handling scheduler internal state, Zephyr requires a somewhat lower-level context switch primitives for SMP systems: `arch_switch()` is always called with interrupts masked, and takes exactly two arguments. The first is an opaque (architecture defined) handle to the context to which it should switch, and the second is a pointer to such a handle into which it should store the handle resulting from the thread that is being switched out.

The kernel then implements a portable `z_swap()` implementation on top of this primitive which includes the relevant scheduler logic in a location where the architecture doesn’t need to understand it. Similarly, on interrupt exit, switch-based architectures are expected to call `z_get_next_switch_handle()` to retrieve the next thread to run from the scheduler, passing in an “interrupted” handle reflecting the same opaque type used by switch, which the kernel will then save in the interrupted thread struct.

Note that while SMP requires `:kconfig: `CONFIG_USE_SWITCH``, the reverse is not true. A uniprocessor architecture built with `:kconfig: `CONFIG_SMP`` set to No might still decide to implement its context switching using `arch_switch()`.

## 7.13.2 Data Passing

These pages cover kernel objects which can be used to pass data between threads and ISRs.

The following table summarizes their high-level features.

Object	Bidirectional?	Data structure	Data item size	Data Alignment	ISRs can receive?	ISRs can send?	Overrun handling
FIFO	No	Queue	Arbitrary [1]	4 B [2]	Yes [3]	Yes	N/A
LIFO	No	Queue	Arbitrary [1]	4 B [2]	Yes [3]	Yes	N/A
Stack	No	Array	Word	Word	Yes [3]	Yes	Undefined behavior
Message queue	No	Ring buffer	Power of two	Power of two	Yes [3]	Yes	Pend thread or return -errno
Mailbox	Yes	Queue	Arbitrary [1]	Arbitrary	No	No	N/A
Pipe	No	Ring buffer [4]	Arbitrary	Arbitrary	No	No	Pend thread or return -errno

[1] Callers allocate space for queue overhead in the data elements themselves.

[2] Objects added with `k_fifo_alloc_put()` and `k_lifo_alloc_put()` do not have alignment constraints, but use temporary memory from the calling thread’s resource pool.

[3] ISRs can receive only when passing `K_NO_WAIT` as the timeout argument.

[4] Optional.

### Queues

A Queue in Zephyr is a kernel object that implements a traditional queue, allowing threads and ISRs to add and remove data items of any size. The queue is similar to a FIFO and serves as the underlying implementation for both `k_fifo` and `k_lifo`. For more information on usage see `k_fifo`.

**Configuration Options**   Related configuration options:

- None

## API Reference

*group* queue\_apis

### Defines

K\_QUEUE\_DEFINE(name)

Statically define and initialize a queue.

The queue can be accessed outside the module where it is defined using:

```
extern struct k_queue <name>;
```

#### Parameters

- name – Name of the queue.

### Functions

void k\_queue\_init(struct k\_queue \*queue)

Initialize a queue.

This routine initializes a queue object, prior to its first use.

#### Parameters

- queue – Address of the queue.

**Returns** N/A

void k\_queue\_cancel\_wait(struct k\_queue \*queue)

Cancel waiting on a queue.

This routine causes first thread pending on *queue*, if any, to return from [k\\_queue\\_get\(\)](#) call with NULL value (as if timeout expired). If the queue is being waited on by [k\\_poll\(\)](#), it will return with -EINTR and K\_POLL\_STATE\_CANCELLED state (and per above, subsequent [k\\_queue\\_get\(\)](#) will return NULL).

**Function properties (list may not be complete)** [isr-ok](#)

#### Parameters

- queue – Address of the queue.

**Returns** N/A

void k\_queue\_append(struct k\_queue \*queue, void \*data)

Append an element to the end of a queue.

This routine appends a data item to *queue*. A queue data item must be aligned on a word boundary, and the first word of the item is reserved for the kernel's use.

**Function properties (list may not be complete)** [isr-ok](#)

**Parameters**

- `queue` – Address of the queue.
- `data` – Address of the data item.

**Returns** N/A

```
int32_t k_queue_alloc_append(struct k_queue *queue, void *data)
```

Append an element to a queue.

This routine appends a data item to *queue*. There is an implicit memory allocation to create an additional temporary bookkeeping data structure from the calling thread's resource pool, which is automatically freed when the item is removed. The data itself is not copied.

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `queue` – Address of the queue.
- `data` – Address of the data item.

**Return values**

- 0 – on success
- -ENOMEM – if there isn't sufficient RAM in the caller's resource pool

```
void k_queue_prepend(struct k_queue *queue, void *data)
```

Prepend an element to a queue.

This routine prepends a data item to *queue*. A queue data item must be aligned on a word boundary, and the first word of the item is reserved for the kernel's use.

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `queue` – Address of the queue.
- `data` – Address of the data item.

**Returns** N/A

```
int32_t k_queue_alloc_prepend(struct k_queue *queue, void *data)
```

Prepend an element to a queue.

This routine prepends a data item to *queue*. There is an implicit memory allocation to create an additional temporary bookkeeping data structure from the calling thread's resource pool, which is automatically freed when the item is removed. The data itself is not copied.

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `queue` – Address of the queue.
- `data` – Address of the data item.

**Return values**

- 0 – on success

- -ENOMEM – if there isn't sufficient RAM in the caller's resource pool

void k\_queue\_insert(struct k\_queue \*queue, void \*prev, void \*data)

Inserts an element to a queue.

This routine inserts a data item to *queue* after previous item. A queue data item must be aligned on a word boundary, and the first word of the item is reserved for the kernel's use.

**Function properties (list may not be complete)** *isr-ok*

#### Parameters

- queue – Address of the queue.
- prev – Address of the previous data item.
- data – Address of the data item.

**Returns** N/A

int k\_queue\_append\_list(struct k\_queue \*queue, void \*head, void \*tail)

Atomically append a list of elements to a queue.

This routine adds a list of data items to *queue* in one operation. The data items must be in a singly-linked list, with the first word in each data item pointing to the next data item; the list must be NULL-terminated.

**Function properties (list may not be complete)** *isr-ok*

#### Parameters

- queue – Address of the queue.
- head – Pointer to first node in singly-linked list.
- tail – Pointer to last node in singly-linked list.

#### Return values

- 0 – on success
- -EINVAL – on invalid supplied data

int k\_queue\_merge\_slist(struct k\_queue \*queue, sys\_slist\_t \*list)

Atomically add a list of elements to a queue.

This routine adds a list of data items to *queue* in one operation. The data items must be in a singly-linked list implemented using a *sys\_slist\_t* object. Upon completion, the original list is empty.

**Function properties (list may not be complete)** *isr-ok*

#### Parameters

- queue – Address of the queue.
- list – Pointer to *sys\_slist\_t* object.

#### Return values

- 0 – on success
- -EINVAL – on invalid data

void `*k_queue_get`(struct k\_queue \*queue, *k\_timeout\_t* timeout)

Get an element from a queue.

This routine removes first data item from *queue*. The first word of the data item is reserved for the kernel's use.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** *timeout* must be set to K\_NO\_WAIT if called from ISR.

---

#### Parameters

- *queue* – Address of the queue.
- *timeout* – Non-negative waiting period to obtain a data item or one of the special values K\_NO\_WAIT and K\_FOREVER.

**Returns** Address of the data item if successful; NULL if returned without waiting, or waiting period timed out.

bool `k_queue_remove`(struct k\_queue \*queue, void \*data)

Remove an element from a queue.

This routine removes data item from *queue*. The first word of the data item is reserved for the kernel's use. Removing elements from *k\_queue* rely on `sys_slist_find_and_remove` which is not a constant time operation.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** *timeout* must be set to K\_NO\_WAIT if called from ISR.

---

#### Parameters

- *queue* – Address of the queue.
- *data* – Address of the data item.

**Returns** true if data item was removed

bool `k_queue_unique_append`(struct k\_queue \*queue, void \*data)

Append an element to a queue only if it's not present already.

This routine appends data item to *queue*. The first word of the data item is reserved for the kernel's use. Appending elements to *k\_queue* relies on `sys_slist_is_node_in_list` which is not a constant time operation.

**Function properties (list may not be complete)** *isr-ok*

#### Parameters

- *queue* – Address of the queue.
- *data* – Address of the data item.

**Returns** true if data item was added, false if not

```
int k_queue_is_empty(struct k_queue *queue)
```

Query a queue to see if it has data available.

Note that the data might be already gone by the time this function returns if other threads are also trying to read from the queue.

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- `queue` – Address of the queue.

**Returns** Non-zero if the queue is empty.

**Returns** 0 if data is available.

```
void *k_queue_peek_head(struct k_queue *queue)
```

Peek element at the head of queue.

Return element from the head of queue without removing it.

**Parameters**

- `queue` – Address of the queue.

**Returns** Head element, or NULL if queue is empty.

```
void *k_queue_peek_tail(struct k_queue *queue)
```

Peek element at the tail of queue.

Return element from the tail of queue without removing it.

**Parameters**

- `queue` – Address of the queue.

**Returns** Tail element, or NULL if queue is empty.

## FIFOs

A *FIFO* is a kernel object that implements a traditional first in, first out (FIFO) queue, allowing threads and ISRs to add and remove data items of any size.

- [Concepts](#)
- [Implementation](#)
  - [Defining a FIFO](#)
  - [Writing to a FIFO](#)
  - [Reading from a FIFO](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of FIFOs can be defined (limited only by available RAM). Each FIFO is referenced by its memory address.

A FIFO has the following key properties:

- A **queue** of data items that have been added but not yet removed. The queue is implemented as a simple linked list.

A FIFO must be initialized before it can be used. This sets its queue to empty.

FIFO data items must be aligned on a word boundary, as the kernel reserves the first word of an item for use as a pointer to the next data item in the queue. Consequently, a data item that holds  $N$  bytes of application data requires  $N+4$  (or  $N+8$ ) bytes of memory. There are no alignment or reserved space requirements for data items if they are added with `k_fifo_alloc_put()`, instead additional memory is temporarily allocated from the calling thread's resource pool.

A data item may be **added** to a FIFO by a thread or an ISR. The item is given directly to a waiting thread, if one exists; otherwise the item is added to the FIFO's queue. There is no limit to the number of items that may be queued.

A data item may be **removed** from a FIFO by a thread. If the FIFO's queue is empty a thread may choose to wait for a data item to be given. Any number of threads may wait on an empty FIFO simultaneously. When a data item is added, it is given to the highest priority thread that has waited longest.

---

**Note:** The kernel does allow an ISR to remove an item from a FIFO, however the ISR must not attempt to wait if the FIFO is empty.

---

If desired, **multiple data items** can be added to a FIFO in a single operation if they are chained together into a singly-linked list. This capability can be useful if multiple writers are adding sets of related data items to the FIFO, as it ensures the data items in each set are not interleaved with other data items. Adding multiple data items to a FIFO is also more efficient than adding them one at a time, and can be used to guarantee that anyone who removes the first data item in a set will be able to remove the remaining data items without waiting.

## Implementation

**Defining a FIFO** A FIFO is defined using a variable of type `k_fifo`. It must then be initialized by calling `k_fifo_init()`.

The following code defines and initializes an empty FIFO.

```
struct k_fifo my_fifo;

k_fifo_init(&my_fifo);
```

Alternatively, an empty FIFO can be defined and initialized at compile time by calling `K_FIFO_DEFINE`.

The following code has the same effect as the code segment above.

```
K_FIFO_DEFINE(my_fifo);
```

**Writing to a FIFO** A data item is added to a FIFO by calling `k_fifo_put()`.

The following code builds on the example above, and uses the FIFO to send data to one or more consumer threads.

```
struct data_item_t {
    void *fifo_reserved;    /* 1st word reserved for use by FIFO */
    ...
};

struct data_item_t tx_data;
```

(continues on next page)

(continued from previous page)

```
void producer_thread(int unused1, int unused2, int unused3)
{
    while (1) {
        /* create data item to send */
        tx_data = ...

        /* send data to consumers */
        k_fifo_put(&my_fifo, &tx_data);

        ...
    }
}
```

Additionally, a singly-linked list of data items can be added to a FIFO by calling `k_fifo_put_list()` or `k_fifo_put_slist()`.

Finally, a data item can be added to a FIFO with `k_fifo_alloc_put()`. With this API, there is no need to reserve space for the kernel's use in the data item, instead additional memory will be allocated from the calling thread's resource pool until the item is read.

**Reading from a FIFO** A data item is removed from a FIFO by calling `k_fifo_get()`.

The following code builds on the example above, and uses the FIFO to obtain data items from a producer thread, which are then processed in some manner.

```
void consumer_thread(int unused1, int unused2, int unused3)
{
    struct data_item_t *rx_data;

    while (1) {
        rx_data = k_fifo_get(&my_fifo, K_FOREVER);

        /* process FIFO data item */
        ...
    }
}
```

**Suggested Uses** Use a FIFO to asynchronously transfer data items of arbitrary size in a “first in, first out” manner.

**Configuration Options** Related configuration options:

- None

## API Reference

group fifo\_apis

### Defines

`k_fifo_init(fifo)`

Initialize a FIFO queue.

This routine initializes a FIFO queue, prior to its first use.

**Parameters**

- `fifo` – Address of the FIFO queue.

**Returns** N/A

`k_fifo_cancel_wait(fifo)`

Cancel waiting on a FIFO queue.

This routine causes first thread pending on *fifo*, if any, to return from `k_fifo_get()` call with NULL value (as if timeout expired).

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `fifo` – Address of the FIFO queue.

**Returns** N/A

`k_fifo_put(fifo, data)`

Add an element to a FIFO queue.

This routine adds a data item to *fifo*. A FIFO data item must be aligned on a word boundary, and the first word of the item is reserved for the kernel's use.

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `fifo` – Address of the FIFO.
- `data` – Address of the data item.

**Returns** N/A

`k_fifo_alloc_put(fifo, data)`

Add an element to a FIFO queue.

This routine adds a data item to *fifo*. There is an implicit memory allocation to create an additional temporary bookkeeping data structure from the calling thread's resource pool, which is automatically freed when the item is removed. The data itself is not copied.

**Function properties (list may not be complete)** *isr-ok***Parameters**

- `fifo` – Address of the FIFO.
- `data` – Address of the data item.

**Return values**

- 0 – on success
- -ENOMEM – if there isn't sufficient RAM in the caller's resource pool

`k_fifo_put_list(fifo, head, tail)`

Atomically add a list of elements to a FIFO.

This routine adds a list of data items to *fifo* in one operation. The data items must be in a singly-linked list, with the first word of each data item pointing to the next data item; the list must be NULL-terminated.

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- `fifo` – Address of the FIFO queue.
- `head` – Pointer to first node in singly-linked list.
- `tail` – Pointer to last node in singly-linked list.

**Returns** N/A

`k_fifo_put_slist(fifo, list)`

Atomically add a list of elements to a FIFO queue.

This routine adds a list of data items to *fifo* in one operation. The data items must be in a singly-linked list implemented using a `sys_slist_t` object. Upon completion, the `sys_slist_t` object is invalid and must be re-initialized via [`sys\_slist\_init\(\)`](#).

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- `fifo` – Address of the FIFO queue.
- `list` – Pointer to `sys_slist_t` object.

**Returns** N/A

`k_fifo_get(fifo, timeout)`

Get an element from a FIFO queue.

This routine removes a data item from *fifo* in a “first in, first out” manner. The first word of the data item is reserved for the kernel’s use.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** *timeout* must be set to `K_NO_WAIT` if called from ISR.

---

**Parameters**

- `fifo` – Address of the FIFO queue.
- `timeout` – Waiting period to obtain a data item, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Returns** Address of the data item if successful; NULL if returned without waiting, or waiting period timed out.

`k_fifo_is_empty(fifo)`

Query a FIFO queue to see if it has data available.

Note that the data might be already gone by the time this function returns if other threads is also trying to read from the FIFO.

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- `fifo` – Address of the FIFO queue.

**Returns** Non-zero if the FIFO queue is empty.

**Returns** 0 if data is available.

`k_fifo_peek_head(fifo)`

Peek element at the head of a FIFO queue.

Return element from the head of FIFO queue without removing it. A usecase for this is if elements of the FIFO object are themselves containers. Then on each iteration of processing, a head container will be peeked, and some data processed out of it, and only if the container is empty, it will be completely remove from the FIFO queue.

**Parameters**

- `fifo` – Address of the FIFO queue.

**Returns** Head element, or NULL if the FIFO queue is empty.

`k_fifo_peek_tail(fifo)`

Peek element at the tail of FIFO queue.

Return element from the tail of FIFO queue (without removing it). A usecase for this is if elements of the FIFO queue are themselves containers. Then it may be useful to add more data to the last container in a FIFO queue.

**Parameters**

- `fifo` – Address of the FIFO queue.

**Returns** Tail element, or NULL if a FIFO queue is empty.

`K_FIFO_DEFINE(name)`

Statically define and initialize a FIFO queue.

The FIFO queue can be accessed outside the module where it is defined using:

```
extern struct k_fifo <name>;
```

**Parameters**

- `name` – Name of the FIFO queue.

## LIFOs

A *LIFO* is a kernel object that implements a traditional last in, first out (LIFO) queue, allowing threads and ISRs to add and remove data items of any size.

- [Concepts](#)
- [Implementation](#)
  - [Defining a LIFO](#)
  - [Writing to a LIFO](#)
  - [Reading from a LIFO](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of LIFOs can be defined (limited only by available RAM). Each LIFO is referenced by its memory address.

A LIFO has the following key properties:

- A **queue** of data items that have been added but not yet removed. The queue is implemented as a simple linked list.

A LIFO must be initialized before it can be used. This sets its queue to empty.

LIFO data items must be aligned on a word boundary, as the kernel reserves the first word of an item for use as a pointer to the next data item in the queue. Consequently, a data item that holds N bytes of application data requires N+4 (or N+8) bytes of memory. There are no alignment or reserved space requirements for data items if they are added with `k_lifo_alloc_put()`, instead additional memory is temporarily allocated from the calling thread's resource pool.

A data item may be **added** to a LIFO by a thread or an ISR. The item is given directly to a waiting thread, if one exists; otherwise the item is added to the LIFO's queue. There is no limit to the number of items that may be queued.

A data item may be **removed** from a LIFO by a thread. If the LIFO's queue is empty a thread may choose to wait for a data item to be given. Any number of threads may wait on an empty LIFO simultaneously. When a data item is added, it is given to the highest priority thread that has waited longest.

---

**Note:** The kernel does allow an ISR to remove an item from a LIFO, however the ISR must not attempt to wait if the LIFO is empty.

---

## Implementation

**Defining a LIFO** A LIFO is defined using a variable of type `k_lifo`. It must then be initialized by calling `k_lifo_init()`.

The following defines and initializes an empty LIFO.

```
struct k_lifo my_lifo;  
  
k_lifo_init(&my_lifo);
```

Alternatively, an empty LIFO can be defined and initialized at compile time by calling `K_LIFO_DEFINE`.

The following code has the same effect as the code segment above.

```
K_LIFO_DEFINE(my_lifo);
```

**Writing to a LIFO** A data item is added to a LIFO by calling `k_lifo_put()`.

The following code builds on the example above, and uses the LIFO to send data to one or more consumer threads.

```
struct data_item_t {
    void *LIFO_reserved; /* 1st word reserved for use by LIFO */
    ...
};

struct data_item_t tx_data;

void producer_thread(int unused1, int unused2, int unused3)
{
    while (1) {
        /* create data item to send */
        tx_data = ...

        /* send data to consumers */
        k_lifo_put(&my_lifo, &tx_data);

        ...
    }
}
```

A data item can be added to a LIFO with `k_lifo_alloc_put()`. With this API, there is no need to reserve space for the kernel's use in the data item, instead additional memory will be allocated from the calling thread's resource pool until the item is read.

**Reading from a LIFO** A data item is removed from a LIFO by calling `k_lifo_get()`.

The following code builds on the example above, and uses the LIFO to obtain data items from a producer thread, which are then processed in some manner.

```
void consumer_thread(int unused1, int unused2, int unused3)
{
    struct data_item_t *rx_data;

    while (1) {
        rx_data = k_lifo_get(&my_lifo, K_FOREVER);

        /* process LIFO data item */
        ...
    }
}
```

**Suggested Uses** Use a LIFO to asynchronously transfer data items of arbitrary size in a “last in, first out” manner.

**Configuration Options** Related configuration options:

- None.

## API Reference

group lifo\_apis

## Defines

`k_lifo_init(lifo)`

Initialize a LIFO queue.

This routine initializes a LIFO queue object, prior to its first use.

### Parameters

- `lifo` – Address of the LIFO queue.

**Returns** N/A

`k_lifo_put(lifo, data)`

Add an element to a LIFO queue.

This routine adds a data item to *lifo*. A LIFO queue data item must be aligned on a word boundary, and the first word of the item is reserved for the kernel's use.

## Function properties (list may not be complete) *isr-ok*

### Parameters

- `lifo` – Address of the LIFO queue.
- `data` – Address of the data item.

**Returns** N/A

`k_lifo_alloc_put(lifo, data)`

Add an element to a LIFO queue.

This routine adds a data item to *lifo*. There is an implicit memory allocation to create an additional temporary bookkeeping data structure from the calling thread's resource pool, which is automatically freed when the item is removed. The data itself is not copied.

## Function properties (list may not be complete) *isr-ok*

### Parameters

- `lifo` – Address of the LIFO.
- `data` – Address of the data item.

### Return values

- 0 – on success
- -ENOMEM – if there isn't sufficient RAM in the caller's resource pool

`k_lifo_get(lifo, timeout)`

Get an element from a LIFO queue.

This routine removes a data item from *LIFO* in a “last in, first out” manner. The first word of the data item is reserved for the kernel's use.

## Function properties (list may not be complete) *isr-ok*

---

**Note:** *timeout* must be set to `K_NO_WAIT` if called from ISR.

---

### Parameters

- `lifo` – Address of the LIFO queue.
- `timeout` – Waiting period to obtain a data item, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Returns** Address of the data item if successful; `NULL` if returned without waiting, or waiting period timed out.

`K_LIFO_DEFINE(name)`

Statically define and initialize a LIFO queue.

The LIFO queue can be accessed outside the module where it is defined using:

```
extern struct k_lifo <name>;
```

#### Parameters

- `name` – Name of the fifo.

## Stacks

A *stack* is a kernel object that implements a traditional last in, first out (LIFO) queue, allowing threads and ISRs to add and remove a limited number of integer data values.

- [Concepts](#)
- [Implementation](#)
  - [Defining a Stack](#)
  - [Pushing to a Stack](#)
  - [Popping from a Stack](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of stacks can be defined (limited only by available RAM). Each stack is referenced by its memory address.

A stack has the following key properties:

- A **queue** of integer data values that have been added but not yet removed. The queue is implemented using an array of `stack_data_t` values and must be aligned on a native word boundary. The `stack_data_t` type corresponds to the native word size i.e. 32 bits or 64 bits depending on the CPU architecture and compilation mode.
- A **maximum quantity** of data values that can be queued in the array.

A stack must be initialized before it can be used. This sets its queue to empty.

A data value can be **added** to a stack by a thread or an ISR. The value is given directly to a waiting thread, if one exists; otherwise the value is added to the LIFO's queue. The kernel does *not* detect attempts to add a data value to a stack that has already reached its maximum quantity of queued values.

**Note:** Adding a data value to a stack that is already full will result in array overflow, and lead to unpredictable behavior.

A data value may be **removed** from a stack by a thread. If the stack's queue is empty a thread may choose to wait for it to be given. Any number of threads may wait on an empty stack simultaneously. When a data item is added, it is given to the highest priority thread that has waited longest.

---

**Note:** The kernel does allow an ISR to remove an item from a stack, however the ISR must not attempt to wait if the stack is empty.

---

## Implementation

**Defining a Stack** A stack is defined using a variable of type `k_stack`. It must then be initialized by calling `k_stack_init()` or `k_stack_alloc_init()`. In the latter case, a buffer is not provided and it is instead allocated from the calling thread's resource pool.

The following code defines and initializes an empty stack capable of holding up to ten word-sized data values.

```
#define MAX_ITEMS 10

stack_data_t my_stack_array[MAX_ITEMS];
struct k_stack my_stack;

k_stack_init(&my_stack, my_stack_array, MAX_ITEMS);
```

Alternatively, a stack can be defined and initialized at compile time by calling `K_STACK_DEFINE`.

The following code has the same effect as the code segment above. Observe that the macro defines both the stack and its array of data values.

```
K_STACK_DEFINE(my_stack, MAX_ITEMS);
```

**Pushing to a Stack** A data item is added to a stack by calling `k_stack_push()`.

The following code builds on the example above, and shows how a thread can create a pool of data structures by saving their memory addresses in a stack.

```
/* define array of data structures */
struct my_buffer_type {
    int field1;
    ...
};
struct my_buffer_type my_buffers[MAX_ITEMS];

/* save address of each data structure in a stack */
for (int i = 0; i < MAX_ITEMS; i++) {
    k_stack_push(&my_stack, (stack_data_t)&my_buffers[i]);
}
```

**Popping from a Stack** A data item is taken from a stack by calling `k_stack_pop()`.

The following code builds on the example above, and shows how a thread can dynamically allocate an unused data structure. When the data structure is no longer required, the thread must push its address back on the stack to allow the data structure to be reused.

```
struct my_buffer_type *new_buffer;

k_stack_pop(&buffer_stack, (stack_data_t *)&new_buffer, K_FOREVER);
new_buffer->field1 = ...
```

**Suggested Uses** Use a stack to store and retrieve integer data values in a “last in, first out” manner, when the maximum number of stored items is known.

**Configuration Options** Related configuration options:

- None.

## API Reference

*group* stack\_apis

### Defines

K\_STACK\_DEFINE(name, stack\_num\_entries)

Statically define and initialize a stack.

The stack can be accessed outside the module where it is defined using:

```
extern struct k_stack <name>;
```

### Parameters

- name – Name of the stack.
- stack\_num\_entries – Maximum number of values that can be stacked.

### Functions

void k\_stack\_init(struct k\_stack \*stack, stack\_data\_t \*buffer, uint32\_t num\_entries)

Initialize a stack.

This routine initializes a stack object, prior to its first use.

### Parameters

- stack – Address of the stack.
- buffer – Address of array used to hold stacked values.
- num\_entries – Maximum number of values that can be stacked.

**Returns** N/A

int32\_t k\_stack\_alloc\_init(struct k\_stack \*stack, uint32\_t num\_entries)

Initialize a stack.

This routine initializes a stack object, prior to its first use. Internal buffers will be allocated from the calling thread’s resource pool. This memory will be released if [k\\_stack\\_cleanup\(\)](#) is called, or userspace is enabled and the stack object loses all references to it.

### Parameters

- `stack` – Address of the stack.
- `num_entries` – Maximum number of values that can be stacked.

**Returns** `-ENOMEM` if memory couldn't be allocated

`int k_stack_cleanup(struct k_stack *stack)`

Release a stack's allocated buffer.

If a stack object was given a dynamically allocated buffer via `k_stack_alloc_init()`, this will free it. This function does nothing if the buffer wasn't dynamically allocated.

**Parameters**

- `stack` – Address of the stack.

**Return values**

- 0 – on success
- `-EAGAIN` – when object is still in use

`int k_stack_push(struct k_stack *stack, stack_data_t data)`

Push an element onto a stack.

This routine adds a `stack_data_t` value `data` to `stack`.

**Function properties (list may not be complete)** *isr-ok*

**Parameters**

- `stack` – Address of the stack.
- `data` – Value to push onto the stack.

**Return values**

- 0 – on success
- `-ENOMEM` – if stack is full

`int k_stack_pop(struct k_stack *stack, stack_data_t *data, k_timeout_t timeout)`

Pop an element from a stack.

This routine removes a `stack_data_t` value from `stack` in a “last in, first out” manner and stores the value in `data`.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** `timeout` must be set to `K_NO_WAIT` if called from ISR.

---

**Parameters**

- `stack` – Address of the stack.
- `data` – Address of area to hold the value popped from the stack.
- `timeout` – Waiting period to obtain a value, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Return values**

- 0 – Element popped from stack.
- `-EBUSY` – Returned without waiting.

- -EAGAIN – Waiting period timed out.

## Message Queues

A *message queue* is a kernel object that implements a simple message queue, allowing threads and ISRs to asynchronously send and receive fixed-size data items.

- [Concepts](#)
- [Implementation](#)
  - [Defining a Message Queue](#)
  - [Writing to a Message Queue](#)
  - [Reading from a Message Queue](#)
  - [Peeking into a Message Queue](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of message queues can be defined (limited only by available RAM). Each message queue is referenced by its memory address.

A message queue has the following key properties:

- A **ring buffer** of data items that have been sent but not yet received.
- A **data item size**, measured in bytes.
- A **maximum quantity** of data items that can be queued in the ring buffer.

The message queue's ring buffer must be aligned to an N-byte boundary, where N is a power of 2 (i.e. 1, 2, 4, 8, ...). To ensure that the messages stored in the ring buffer are similarly aligned to this boundary, the data item size must also be a multiple of N.

A message queue must be initialized before it can be used. This sets its ring buffer to empty.

A data item can be **sent** to a message queue by a thread or an ISR. The data item pointed at by the sending thread is copied to a waiting thread, if one exists; otherwise the item is copied to the message queue's ring buffer, if space is available. In either case, the size of the data area being sent *must* equal the message queue's data item size.

If a thread attempts to send a data item when the ring buffer is full, the sending thread may choose to wait for space to become available. Any number of sending threads may wait simultaneously when the ring buffer is full; when space becomes available it is given to the highest priority sending thread that has waited the longest.

A data item can be **received** from a message queue by a thread. The data item is copied to the area specified by the receiving thread; the size of the receiving area *must* equal the message queue's data item size.

If a thread attempts to receive a data item when the ring buffer is empty, the receiving thread may choose to wait for a data item to be sent. Any number of receiving threads may wait simultaneously when the ring buffer is empty; when a data item becomes available it is given to the highest priority receiving thread that has waited the longest.

A thread can also **peek** at the message on the head of a message queue without removing it from the queue. The data item is copied to the area specified by the receiving thread; the size of the receiving area *must* equal the message queue's data item size.

**Note:** The kernel does allow an ISR to receive an item from a message queue, however the ISR must not attempt to wait if the message queue is empty.

---

## Implementation

**Defining a Message Queue** A message queue is defined using a variable of type `k_msgq`. It must then be initialized by calling `k_msgq_init()`.

The following code defines and initializes an empty message queue that is capable of holding 10 items, each of which is 12 bytes long.

```
struct data_item_type {
    uint32_t field1;
    uint32_t field2;
    uint32_t field3;
};

char __aligned(4) my_msgq_buffer[10 * sizeof(struct data_item_type)];
struct k_msgq my_msgq;

k_msgq_init(&my_msgq, my_msgq_buffer, sizeof(struct data_item_type), 10);
```

Alternatively, a message queue can be defined and initialized at compile time by calling `K_MSGQ_DEFINE`.

The following code has the same effect as the code segment above. Observe that the macro defines both the message queue and its buffer.

```
K_MSGQ_DEFINE(my_msgq, sizeof(struct data_item_type), 10, 4);
```

The following code demonstrates an alignment implementation for the structure defined in the previous example code. `aligned` means each `data_item_type` will begin on the specified byte boundary. `aligned(4)` means that the structure is aligned to an address that is divisible by 4.

```
typedef struct {
    uint32_t field1;
    uint32_t field2;
    uint32_t field3;
}__attribute__((aligned(4))) data_item_type;
```

**Writing to a Message Queue** A data item is added to a message queue by calling `k_msgq_put()`.

The following code builds on the example above, and uses the message queue to pass data items from a producing thread to one or more consuming threads. If the message queue fills up because the consumers can't keep up, the producing thread throws away all existing data so the newer data can be saved.

```
void producer_thread(void)
{
    struct data_item_type data;

    while (1) {
        /* create data item to send (e.g. measurement, timestamp, ...) */
        data = ...

        /* send data to consumers */
        while (k_msgq_put(&my_msgq, &data, K_NO_WAIT) != 0) {
```

(continues on next page)

(continued from previous page)

```

        /* message queue is full: purge old data & try again */
        k_msgq_purge(&my_msgq);
    }

    /* data item was successfully added to message queue */
}
}

```

**Reading from a Message Queue** A data item is taken from a message queue by calling `k_msgq_get()`.

The following code builds on the example above, and uses the message queue to process data items generated by one or more producing threads. Note that the return value of `k_msgq_get()` should be tested as `-ENOMSG` can be returned due to `k_msgq_purge()`.

```

void consumer_thread(void)
{
    struct data_item_type data;

    while (1) {
        /* get a data item */
        k_msgq_get(&my_msgq, &data, K_FOREVER);

        /* process data item */
        ...
    }
}

```

**Peeking into a Message Queue** A data item is read from a message queue by calling `k_msgq_peek()`.

The following code peeks into the message queue to read the data item at the head of the queue that is generated by one or more producing threads.

```

void consumer_thread(void)
{
    struct data_item_type data;

    while (1) {
        /* read a data item by peeking into the queue */
        k_msgq_peek(&my_msgq, &data);

        /* process data item */
        ...
    }
}

```

**Suggested Uses** Use a message queue to transfer small data items between threads in an asynchronous manner.

---

**Note:** A message queue can be used to transfer large data items, if desired. However, this can increase interrupt latency as interrupts are locked while a data item is written or read. It is usually preferable to transfer large data items by exchanging a pointer to the data item, rather than the data item itself. The kernel's memory map and memory pool object types can be helpful for data transfers of this sort.

A synchronous transfer can be achieved by using the kernel's mailbox object type.

---

**Configuration Options**   Related configuration options:

- None.

## API Reference

group msgq\_apis

### Defines

K\_MSGQ\_FLAG\_ALLOC

K\_MSGQ\_DEFINE(*q\_name*, *q\_msg\_size*, *q\_max\_msgs*, *q\_align*)

Statically define and initialize a message queue.

The message queue's ring buffer contains space for *q\_max\_msgs* messages, each of which is *q\_msg\_size* bytes long. The buffer is aligned to a *q\_align* -byte boundary, which must be a power of 2. To ensure that each message is similarly aligned to this boundary, *q\_msg\_size* must also be a multiple of *q\_align*.

The message queue can be accessed outside the module where it is defined using:

```
extern struct k_msgq <name>;
```

### Parameters

- *q\_name* – Name of the message queue.
- *q\_msg\_size* – Message size (in bytes).
- *q\_max\_msgs* – Maximum number of messages that can be queued.
- *q\_align* – Alignment of the message queue's ring buffer.

### Functions

void k\_msgq\_init(struct [k\\_msgq](#) \*msgq, char \*buffer, size\_t msg\_size, uint32\_t max\_msgs)

Initialize a message queue.

This routine initializes a message queue object, prior to its first use.

The message queue's ring buffer must contain space for *max\_msgs* messages, each of which is *msg\_size* bytes long. The buffer must be aligned to an N-byte boundary, where N is a power of 2 (i.e. 1, 2, 4, ...). To ensure that each message is similarly aligned to this boundary, *q\_msg\_size* must also be a multiple of N.

### Parameters

- *msgq* – Address of the message queue.
- *buffer* – Pointer to ring buffer that holds queued messages.
- *msg\_size* – Message size (in bytes).
- *max\_msgs* – Maximum number of messages that can be queued.

**Returns** N/A

```
int k_msgq_alloc_init(struct k_msgq *msgq, size_t msg_size, uint32_t max_msgs)
```

Initialize a message queue.

This routine initializes a message queue object, prior to its first use, allocating its internal ring buffer from the calling thread's resource pool.

Memory allocated for the ring buffer can be released by calling [k\\_msgq\\_cleanup\(\)](#), or if userspace is enabled and the msgq object loses all of its references.

#### Parameters

- `msgq` – Address of the message queue.
- `msg_size` – Message size (in bytes).
- `max_msgs` – Maximum number of messages that can be queued.

**Returns** 0 on success, -ENOMEM if there was insufficient memory in the thread's resource pool, or -EINVAL if the size parameters cause an integer overflow.

```
int k_msgq_cleanup(struct k_msgq *msgq)
```

Release allocated buffer for a queue.

Releases memory allocated for the ring buffer.

#### Parameters

- `msgq` – message queue to cleanup

#### Return values

- 0 – on success
- -EBUSY – Queue not empty

```
int k_msgq_put(struct k_msgq *msgq, const void *data, k_timeout_t timeout)
```

Send a message to a message queue.

This routine sends a message to message queue *q*.

#### Function properties (list may not be complete) [isr-ok](#)

---

**Note:** The message content is copied from *data* into *msgq* and the *data* pointer is not retained, so the message content will not be modified by this function.

---

#### Parameters

- `msgq` – Address of the message queue.
- `data` – Pointer to the message.
- `timeout` – Non-negative waiting period to add the message, or one of the special values K\_NO\_WAIT and K\_FOREVER.

#### Return values

- 0 – Message sent.
- -ENOMSG – Returned without waiting or queue purged.
- -EAGAIN – Waiting period timed out.

```
int k_msgq_get (struct k_msgq *msgq, void *data, k_timeout_t timeout)
```

Receive a message from a message queue.

This routine receives a message from message queue *q* in a “first in, first out” manner.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** *timeout* must be set to K\_NO\_WAIT if called from ISR.

---

#### Parameters

- *msgq* – Address of the message queue.
- *data* – Address of area to hold the received message.
- *timeout* – Waiting period to receive the message, or one of the special values K\_NO\_WAIT and K\_FOREVER.

#### Return values

- 0 – Message received.
- -ENOMSG – Returned without waiting.
- -EAGAIN – Waiting period timed out.

```
int k_msgq_peek (struct k_msgq *msgq, void *data)
```

Peek/read a message from a message queue.

This routine reads a message from message queue *q* in a “first in, first out” manner and leaves the message in the queue.

**Function properties (list may not be complete)** *isr-ok*

#### Parameters

- *msgq* – Address of the message queue.
- *data* – Address of area to hold the message read from the queue.

#### Return values

- 0 – Message read.
- -ENOMSG – Returned when the queue has no message.

```
void k_msgq_purge (struct k_msgq *msgq)
```

Purge a message queue.

This routine discards all unreceived messages in a message queue’s ring buffer. Any threads that are blocked waiting to send a message to the message queue are unblocked and see an -ENOMSG error code.

#### Parameters

- *msgq* – Address of the message queue.

**Returns** N/A

```
uint32_t k_msgq_num_free_get(struct k_msgq *msgq)
```

Get the amount of free space in a message queue.

This routine returns the number of unused entries in a message queue's ring buffer.

**Parameters**

- msgq – Address of the message queue.

**Returns** Number of unused ring buffer entries.

```
void k_msgq_get_attrs(struct k_msgq *msgq, struct k_msgq_attrs *attrs)
```

Get basic attributes of a message queue.

This routine fetches basic attributes of message queue into attr argument.

**Parameters**

- msgq – Address of the message queue.
- attrs – pointer to message queue attribute structure.

**Returns** N/A

```
uint32_t k_msgq_num_used_get(struct k_msgq *msgq)
```

Get the number of messages in a message queue.

This routine returns the number of messages in a message queue's ring buffer.

**Parameters**

- msgq – Address of the message queue.

**Returns** Number of messages.

```
struct k_msgq
```

*#include <kernel.h>* Message Queue Structure.

**Public Members**

```
_wait_q_t wait_q
```

Message queue wait queue

```
struct k_spinlock lock
```

Lock

```
size_t msg_size
```

Message size

```
uint32_t max_msgs
```

Maximal number of messages

```
char *buffer_start
```

Start of message buffer

```
char *buffer_end
```

End of message buffer

char \*read\_ptr  
Read pointer

char \*write\_ptr  
Write pointer

uint32\_t used\_msgs  
Number of used messages

uint8\_t flags  
Message queue

struct k\_msgq\_attrs  
*#include <kernel.h>* Message Queue Attributes.

### Public Members

size\_t msg\_size  
Message Size

uint32\_t max\_msgs  
Maximal number of messages

uint32\_t used\_msgs  
Used messages

## Mailboxes

A *mailbox* is a kernel object that provides enhanced message queue capabilities that go beyond the capabilities of a message queue object. A mailbox allows threads to send and receive messages of any size synchronously or asynchronously.

- [Concepts](#)
  - [Message Format](#)
  - [Message Lifecycle](#)
  - [Thread Compatibility](#)
  - [Message Flow Control](#)
- [Implementation](#)
  - [Defining a Mailbox](#)
  - [Message Descriptors](#)
  - [Sending a Message](#)
  - [Receiving a Message](#)
- [Suggested Uses](#)
- [Configuration Options](#)

- [API Reference](#)

---

**Concepts** Any number of mailboxes can be defined (limited only by available RAM). Each mailbox is referenced by its memory address.

A mailbox has the following key properties:

- A **send queue** of messages that have been sent but not yet received.
- A **receive queue** of threads that are waiting to receive a message.

A mailbox must be initialized before it can be used. This sets both of its queues to empty.

A mailbox allows threads, but not ISRs, to exchange messages. A thread that sends a message is known as the **sending thread**, while a thread that receives the message is known as the **receiving thread**. Each message may be received by only one thread (i.e. point-to-multipoint and broadcast messaging is not supported).

Messages exchanged using a mailbox are handled non-anonymously, allowing both threads participating in an exchange to know (and even specify) the identity of the other thread.

**Message Format** A **message descriptor** is a data structure that specifies where a message's data is located, and how the message is to be handled by the mailbox. Both the sending thread and the receiving thread supply a message descriptor when accessing a mailbox. The mailbox uses the message descriptors to perform a message exchange between compatible sending and receiving threads. The mailbox also updates certain message descriptor fields during the exchange, allowing both threads to know what has occurred.

A mailbox message contains zero or more bytes of **message data**. The size and format of the message data is application-defined, and can vary from one message to the next. There are two forms of message data:

- A **message buffer** is an area of memory provided by the thread that sends or receives the message. An array or structure variable can often be used for this purpose.
- A **message block** is an area of memory allocated from a memory pool.

A message may *not* have both a message buffer and a message block. A message that has neither form of message data is called an **empty message**.

---

**Note:** A message whose message buffer or memory block exists, but contains zero bytes of actual data, is *not* an empty message.

---

**Message Lifecycle** The life cycle of a message is straightforward. A message is created when it is given to a mailbox by the sending thread. The message is then owned by the mailbox until it is given to a receiving thread. The receiving thread may retrieve the message data when it receives the message from the mailbox, or it may perform data retrieval during a second, subsequent mailbox operation. Only when data retrieval has occurred is the message deleted by the mailbox.

**Thread Compatibility** A sending thread can specify the address of the thread to which the message is sent, or send it to any thread by specifying `K_ANY`. Likewise, a receiving thread can specify the address of the thread from which it wishes to receive a message, or it can receive a message from any thread by specifying `K_ANY`. A message is exchanged only when the requirements of both the sending thread and receiving thread are satisfied; such threads are said to be **compatible**.

For example, if thread A sends a message to thread B (and only thread B) it will be received by thread B if thread B tries to receive a message from thread A or if thread B tries to receive from any thread. The

exchange will not occur if thread B tries to receive a message from thread C. The message can never be received by thread C, even if it tries to receive a message from thread A (or from any thread).

**Message Flow Control** Mailbox messages can be exchanged **synchronously** or **asynchronously**. In a synchronous exchange, the sending thread blocks until the message has been fully processed by the receiving thread. In an asynchronous exchange, the sending thread does not wait until the message has been received by another thread before continuing; this allows the sending thread to do other work (such as gather data that will be used in the next message) *before* the message is given to a receiving thread and fully processed. The technique used for a given message exchange is determined by the sending thread.

The synchronous exchange technique provides an implicit form of flow control, preventing a sending thread from generating messages faster than they can be consumed by receiving threads. The asynchronous exchange technique provides an explicit form of flow control, which allows a sending thread to determine if a previously sent message still exists before sending a subsequent message.

## Implementation

**Defining a Mailbox** A mailbox is defined using a variable of type `k_mbox`. It must then be initialized by calling `k_mbox_init()`.

The following code defines and initializes an empty mailbox.

```
struct k_mbox my_mailbox;

k_mbox_init(&my_mailbox);
```

Alternatively, a mailbox can be defined and initialized at compile time by calling `K_MBOX_DEFINE`.

The following code has the same effect as the code segment above.

```
K_MBOX_DEFINE(my_mailbox);
```

**Message Descriptors** A message descriptor is a structure of type `k_mbox_msg`. Only the fields listed below should be used; any other fields are for internal mailbox use only.

**info** A 32-bit value that is exchanged by the message sender and receiver, and whose meaning is defined by the application. This exchange is bi-directional, allowing the sender to pass a value to the receiver during any message exchange, and allowing the receiver to pass a value to the sender during a synchronous message exchange.

**size** The message data size, in bytes. Set it to zero when sending an empty message, or when sending a message buffer or message block with no actual data. When receiving a message, set it to the maximum amount of data desired, or to zero if the message data is not wanted. The mailbox updates this field with the actual number of data bytes exchanged once the message is received.

**tx\_data** A pointer to the sending thread's message buffer. Set it to NULL when sending a memory block, or when sending an empty message. Leave this field uninitialized when receiving a message.

**tx\_block** The descriptor for the sending thread's memory block. Set `tx_block.data` to NULL when sending an empty message. Leave this field uninitialized when sending a message buffer, or when receiving a message.

**tx\_target\_thread** The address of the desired receiving thread. Set it to `K_ANY` to allow any thread to receive the message. Leave this field uninitialized when receiving a message. The mailbox updates this field with the actual receiver's address once the message is received.

**rx\_source\_thread** The address of the desired sending thread. Set it to `K_ANY` to receive a message sent by any thread. Leave this field uninitialized when sending a message. The mailbox updates this field with the actual sender's address when the message is put into the mailbox.

**Sending a Message** A thread sends a message by first creating its message data, if any. A message buffer is typically used when the data volume is small, and the cost of copying the data is less than the cost of allocating and freeing a message block.

Next, the sending thread creates a message descriptor that characterizes the message to be sent, as described in the previous section.

Finally, the sending thread calls a mailbox send API to initiate the message exchange. The message is immediately given to a compatible receiving thread, if one is currently waiting. Otherwise, the message is added to the mailbox's send queue.

Any number of messages may exist simultaneously on a send queue. The messages in the send queue are sorted according to the priority of the sending thread. Messages of equal priority are sorted so that the oldest message can be received first.

For a synchronous send operation, the operation normally completes when a receiving thread has both received the message and retrieved the message data. If the message is not received before the waiting period specified by the sending thread is reached, the message is removed from the mailbox's send queue and the send operation fails. When a send operation completes successfully the sending thread can examine the message descriptor to determine which thread received the message, how much data was exchanged, and the application-defined info value supplied by the receiving thread.

---

**Note:** A synchronous send operation may block the sending thread indefinitely, even when the thread specifies a maximum waiting period. The waiting period only limits how long the mailbox waits before the message is received by another thread. Once a message is received there is *no* limit to the time the receiving thread may take to retrieve the message data and unblock the sending thread.

---

For an asynchronous send operation, the operation always completes immediately. This allows the sending thread to continue processing regardless of whether the message is given to a receiving thread immediately or added to the send queue. The sending thread may optionally specify a semaphore that the mailbox gives when the message is deleted by the mailbox, for example, when the message has been received and its data retrieved by a receiving thread. The use of a semaphore allows the sending thread to easily implement a flow control mechanism that ensures that the mailbox holds no more than an application-specified number of messages from a sending thread (or set of sending threads) at any point in time.

---

**Note:** A thread that sends a message asynchronously has no way to determine which thread received the message, how much data was exchanged, or the application-defined info value supplied by the receiving thread.

---

**Sending an Empty Message** This code uses a mailbox to synchronously pass 4 byte random values to any consuming thread that wants one. The message "info" field is large enough to carry the information being exchanged, so the data portion of the message isn't used.

```
void producer_thread(void)
{
    struct k_mbox_msg send_msg;

    while (1) {

        /* generate random value to send */
        uint32_t random_value = sys_rand32_get();

        /* prepare to send empty message */
        send_msg.info = random_value;
        send_msg.size = 0;
    }
}
```

(continues on next page)

(continued from previous page)

```
    send_msg.tx_data = NULL;
    send_msg.tx_block.data = NULL;
    send_msg.tx_target_thread = K_ANY;

    /* send message and wait until a consumer receives it */
    k_mbox_put(&my_mailbox, &send_msg, K_FOREVER);
}
}
```

**Sending Data Using a Message Buffer** This code uses a mailbox to synchronously pass variable-sized requests from a producing thread to any consuming thread that wants it. The message “info” field is used to exchange information about the maximum size message buffer that each thread can handle.

```
void producer_thread(void)
{
    char buffer[100];
    int buffer_bytes_used;

    struct k_mbox_msg send_msg;

    while (1) {

        /* generate data to send */
        ...
        buffer_bytes_used = ... ;
        memcpy(buffer, source, buffer_bytes_used);

        /* prepare to send message */
        send_msg.info = buffer_bytes_used;
        send_msg.size = buffer_bytes_used;
        send_msg.tx_data = buffer;
        send_msg.tx_block.data = NULL;
        send_msg.tx_target_thread = K_ANY;

        /* send message and wait until a consumer receives it */
        k_mbox_put(&my_mailbox, &send_msg, K_FOREVER);

        /* info, size, and tx_target_thread fields have been updated */

        /* verify that message data was fully received */
        if (send_msg.size < buffer_bytes_used) {
            printf("some message data dropped during transfer!");
            printf("receiver only had room for %d bytes", send_msg.info);
        }
    }
}
```

**Sending Data Using a Message Block** This code uses a mailbox to send asynchronous messages. A semaphore is used to hold off the sending of a new message until the previous message has been consumed, so that a backlog of messages doesn’t build up when the consuming thread is unable to keep up.

The message data is stored in a memory block obtained from a memory pool, thereby eliminating unneeded data copying when exchanging large messages. The memory pool contains only two blocks: one block gets filled with data while the previously sent block is being processed

```

/* define a semaphore, indicating that no message has been sent */
K_SEM_DEFINE(my_sem, 1, 1);

/* define a memory pool containing 2 blocks of 4096 bytes */
K_MEM_POOL_DEFINE(my_pool, 4096, 4096, 2, 4);

void producer_thread(void)
{
    struct k_mbox_msg send_msg;

    volatile char *hw_buffer;

    while (1) {
        /* allocate a memory block to hold the message data */
        k_mem_pool_alloc(&my_pool, &send_msg.tx_block, 4096, K_FOREVER);

        /* keep overwriting the hardware-generated data in the block */
        /* until the previous message has been received by the consumer */
        do {
            memcpy(send_msg.tx_block.data, hw_buffer, 4096);
        } while (k_sem_take(&my_sem, K_NO_WAIT) != 0);

        /* finish preparing to send message */
        send_msg.size = 4096;
        send_msg.tx_target_thread = K_ANY;

        /* send message containing most current data and loop around */
        k_mbox_async_put(&my_mailbox, &send_msg, &my_sem);
    }
}

```

**Receiving a Message** A thread receives a message by first creating a message descriptor that characterizes the message it wants to receive. It then calls one of the mailbox receive APIs. The mailbox searches its send queue and takes the message from the first compatible thread it finds. If no compatible thread exists, the receiving thread may choose to wait for one. If no compatible thread appears before the waiting period specified by the receiving thread is reached, the receive operation fails. Once a receive operation completes successfully the receiving thread can examine the message descriptor to determine which thread sent the message, how much data was exchanged, and the application-defined info value supplied by the sending thread.

Any number of receiving threads may wait simultaneously on a mailboxes' receive queue. The threads are sorted according to their priority; threads of equal priority are sorted so that the one that started waiting first can receive a message first.

---

**Note:** Receiving threads do not always receive messages in a first in, first out (FIFO) order, due to the thread compatibility constraints specified by the message descriptors. For example, if thread A waits to receive a message only from thread X and then thread B waits to receive a message from thread Y, an incoming message from thread Y to any thread will be given to thread B and thread A will continue to wait.

---

The receiving thread controls both the quantity of data it retrieves from an incoming message and where the data ends up. The thread may choose to take all of the data in the message, to take only the initial part of the data, or to take no data at all. Similarly, the thread may choose to have the data copied into a message buffer of its choice or to have it placed in a message block. A message buffer is typically used when the volume of data involved is small, and the cost of copying the data is less than the cost of allocating and freeing a memory pool block.

The following sections outline various approaches a receiving thread may use when retrieving message data.

**Retrieving Data at Receive Time** The most straightforward way for a thread to retrieve message data is to specify a message buffer when the message is received. The thread indicates both the location of the message buffer (which must not be NULL) and its size.

The mailbox copies the message's data to the message buffer as part of the receive operation. If the message buffer is not big enough to contain all of the message's data, any uncopied data is lost. If the message is not big enough to fill all of the buffer with data, the unused portion of the message buffer is left unchanged. In all cases the mailbox updates the receiving thread's message descriptor to indicate how many data bytes were copied (if any).

The immediate data retrieval technique is best suited for small messages where the maximum size of a message is known in advance.

---

**Note:** This technique can be used when the message data is actually located in a memory block supplied by the sending thread. The mailbox copies the data into the message buffer specified by the receiving thread, then frees the message block back to its memory pool. This allows a receiving thread to retrieve message data without having to know whether the data was sent using a message buffer or a message block.

---

The following code uses a mailbox to process variable-sized requests from any producing thread, using the immediate data retrieval technique. The message "info" field is used to exchange information about the maximum size message buffer that each thread can handle.

```
void consumer_thread(void)
{
    struct k_mbox_msg recv_msg;
    char buffer[100];

    int i;
    int total;

    while (1) {
        /* prepare to receive message */
        recv_msg.info = 100;
        recv_msg.size = 100;
        recv_msg.rx_source_thread = K_ANY;

        /* get a data item, waiting as long as needed */
        k_mbox_get(&my_mailbox, &recv_msg, buffer, K_FOREVER);

        /* info, size, and rx_source_thread fields have been updated */

        /* verify that message data was fully received */
        if (recv_msg.info != recv_msg.size) {
            printf("some message data dropped during transfer!");
            printf("sender tried to send %d bytes", recv_msg.info);
        }

        /* compute sum of all message bytes (from 0 to 100 of them) */
        total = 0;
        for (i = 0; i < recv_msg.size; i++) {
            total += buffer[i];
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

    }
}

```

**Retrieving Data Later Using a Message Buffer** A receiving thread may choose to defer message data retrieval at the time the message is received, so that it can retrieve the data into a message buffer at a later time. The thread does this by specifying a message buffer location of NULL and a size indicating the maximum amount of data it is willing to retrieve later.

The mailbox does not copy any message data as part of the receive operation. However, the mailbox still updates the receiving thread's message descriptor to indicate how many data bytes are available for retrieval.

The receiving thread must then respond as follows:

- If the message descriptor size is zero, then either the sender's message contained no data or the receiving thread did not want to receive any data. The receiving thread does not need to take any further action, since the mailbox has already completed data retrieval and deleted the message.
- If the message descriptor size is non-zero and the receiving thread still wants to retrieve the data, the thread must call `k_mbox_data_get()` and supply a message buffer large enough to hold the data. The mailbox copies the data into the message buffer and deletes the message.
- If the message descriptor size is non-zero and the receiving thread does *not* want to retrieve the data, the thread must call `k_mbox_data_get()` and specify a message buffer of NULL. The mailbox deletes the message without copying the data.

The subsequent data retrieval technique is suitable for applications where immediate retrieval of message data is undesirable. For example, it can be used when memory limitations make it impractical for the receiving thread to always supply a message buffer capable of holding the largest possible incoming message.

---

**Note:** This technique can be used when the message data is actually located in a memory block supplied by the sending thread. The mailbox copies the data into the message buffer specified by the receiving thread, then frees the message block back to its memory pool. This allows a receiving thread to retrieve message data without having to know whether the data was sent using a message buffer or a message block.

---

The following code uses a mailbox's deferred data retrieval mechanism to get message data from a producing thread only if the message meets certain criteria, thereby eliminating unneeded data copying. The message "info" field supplied by the sender is used to classify the message.

```

void consumer_thread(void)
{
    struct k_mbox_msg recv_msg;
    char buffer[10000];

    while (1) {
        /* prepare to receive message */
        recv_msg.size = 10000;
        recv_msg.rx_source_thread = K_ANY;

        /* get message, but not its data */
        k_mbox_get(&my_mailbox, &recv_msg, NULL, K_FOREVER);

        /* get message data for only certain types of messages */
        if (is_message_type_ok(recv_msg.info)) {
            /* retrieve message data and delete the message */

```

(continues on next page)

(continued from previous page)

```
    k_mbox_data_get(&recv_msg, buffer);

    /* process data in "buffer" */
    ...
} else {
    /* ignore message data and delete the message */
    k_mbox_data_get(&recv_msg, NULL);
}
}
```

**Retrieving Data Later Using a Message Block** A receiving thread may choose to retrieve message data into a memory block, rather than a message buffer. This is done in much the same way as retrieving data subsequently into a message buffer — the receiving thread first receives the message without its data, then retrieves the data by calling `k_mbox_data_block_get()`. The mailbox fills in the block descriptor supplied by the receiving thread, allowing the thread to access the data. The mailbox also deletes the received message, since data retrieval has been completed. The receiving thread is then responsible for freeing the message block back to the memory pool when the data is no longer needed.

This technique is best suited for applications where the message data has been sent using a memory block.

---

**Note:** This technique can be used when the message data is located in a message buffer supplied by the sending thread. The mailbox automatically allocates a memory block and copies the message data into it. However, this is much less efficient than simply retrieving the data into a message buffer supplied by the receiving thread. In addition, the receiving thread must be designed to handle cases where the data retrieval operation fails because the mailbox cannot allocate a suitable message block from the memory pool. If such cases are possible, the receiving thread must either try retrieving the data at a later time or instruct the mailbox to delete the message without retrieving the data.

---

The following code uses a mailbox to receive messages sent using a memory block, thereby eliminating unneeded data copying when processing a large message. (The messages may be sent synchronously or asynchronously.)

```
/* define a memory pool containing 1 block of 10000 bytes */
K_MEM_POOL_DEFINE(my_pool, 10000, 10000, 1, 4);

void consumer_thread(void)
{
    struct k_mbox_msg recv_msg;
    struct k_mem_block recv_block;

    int total;
    char *data_ptr;
    int i;

    while (1) {
        /* prepare to receive message */
        recv_msg.size = 10000;
        recv_msg.rx_source_thread = K_ANY;

        /* get message, but not its data */
        k_mbox_get(&my_mailbox, &recv_msg, NULL, K_FOREVER);

        /* get message data as a memory block and discard message */
```

(continues on next page)

(continued from previous page)

```

k_mbox_data_block_get(&recv_msg, &my_pool, &recv_block, K_FOREVER);

/* compute sum of all message bytes in memory block */
total = 0;
data_ptr = (char *) (recv_block.data);
for (i = 0; i < recv_msg.size; i++) {
    total += data_ptr++;
}

/* release memory block containing data */
k_mem_pool_free(&recv_block);
}
}

```

---

**Note:** An incoming message that was sent using a message buffer is also processed correctly by this algorithm, since the mailbox automatically allocates a memory block from the memory pool and fills it with the message data. However, the performance benefit of using the memory block approach is lost.

---

**Suggested Uses** Use a mailbox to transfer data items between threads whenever the capabilities of a message queue are insufficient.

**Configuration Options** Related configuration options:

## API Reference

group mailbox\_apis

### Defines

K\_MBOX\_DEFINE(name)

Statically define and initialize a mailbox.

The mailbox is to be accessed outside the module where it is defined using:

```
extern struct k_mbox <name>;
```

### Parameters

- name – Name of the mailbox.

### Functions

void k\_mbox\_init(struct *k\_mbox* \*mbox)

Initialize a mailbox.

This routine initializes a mailbox object, prior to its first use.

### Parameters

- mbox – Address of the mailbox.

**Returns** N/A

int k\_mbox\_put (struct *k\_mbox* \*mbox, struct *k\_mbox\_msg* \*tx\_msg, *k\_timeout\_t* timeout)

Send a mailbox message in a synchronous manner.

This routine sends a message to *mbox* and waits for a receiver to both receive and process it. The message data may be in a buffer, in a memory pool block, or non-existent (i.e. an empty message).

**Parameters**

- *mbox* – Address of the mailbox.
- *tx\_msg* – Address of the transmit message descriptor.
- *timeout* – Waiting period for the message to be received, or one of the special values *K\_NO\_WAIT* and *K\_FOREVER*. Once the message has been received, this routine waits as long as necessary for the message to be completely processed.

**Return values**

- 0 – Message sent.
- *-ENOMSG* – Returned without waiting.
- *-EAGAIN* – Waiting period timed out.

void k\_mbox\_async\_put (struct *k\_mbox* \*mbox, struct *k\_mbox\_msg* \*tx\_msg, struct *k\_sem* \*sem)

Send a mailbox message in an asynchronous manner.

This routine sends a message to *mbox* without waiting for a receiver to process it. The message data may be in a buffer, in a memory pool block, or non-existent (i.e. an empty message). Optionally, the semaphore *sem* will be given when the message has been both received and completely processed by the receiver.

**Parameters**

- *mbox* – Address of the mailbox.
- *tx\_msg* – Address of the transmit message descriptor.
- *sem* – Address of a semaphore, or NULL if none is needed.

**Returns** N/A

int k\_mbox\_get (struct *k\_mbox* \*mbox, struct *k\_mbox\_msg* \*rx\_msg, void \*buffer, *k\_timeout\_t* timeout)

Receive a mailbox message.

This routine receives a message from *mbox*, then optionally retrieves its data and disposes of the message.

**Parameters**

- *mbox* – Address of the mailbox.
- *rx\_msg* – Address of the receive message descriptor.
- *buffer* – Address of the buffer to receive data, or NULL to defer data retrieval and message disposal until later.
- *timeout* – Waiting period for a message to be received, or one of the special values *K\_NO\_WAIT* and *K\_FOREVER*.

**Return values**

- 0 – Message received.
- *-ENOMSG* – Returned without waiting.
- *-EAGAIN* – Waiting period timed out.

```
void k_mbox_data_get(struct k_mbox_msg *rx_msg, void *buffer)
```

Retrieve mailbox message data into a buffer.

This routine completes the processing of a received message by retrieving its data into a buffer, then disposing of the message.

Alternatively, this routine can be used to dispose of a received message without retrieving its data.

#### Parameters

- `rx_msg` – Address of the receive message descriptor.
- `buffer` – Address of the buffer to receive data, or NULL to discard the data.

**Returns** N/A

```
struct k_mbox_msg
```

*#include <kernel.h>* Mailbox Message Structure.

#### Public Members

```
size_t size
```

size of message (in bytes)

```
uint32_t info
```

application-defined information value

```
void *tx_data
```

sender's message data buffer

```
struct k_mem_block tx_block
```

## Pipes

A *pipe* is a kernel object that allows a thread to send a byte stream to another thread. Pipes can be used to transfer chunks of data in whole or in part, and either synchronously or asynchronously.

- [Concepts](#)
- [Implementation](#)
  - [Writing to a Pipe](#)
  - [Reading from a Pipe](#)
- [Suggested uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** The pipe can be configured with a ring buffer which holds data that has been sent but not yet received; alternatively, the pipe may have no ring buffer.

Any number of pipes can be defined (limited only by available RAM). Each pipe is referenced by its memory address.

A pipe has the following key property:

- A **size** that indicates the size of the pipe's ring buffer. Note that a size of zero defines a pipe with no ring buffer.

A pipe must be initialized before it can be used. The pipe is initially empty.

Data can be synchronously **sent** either in whole or in part to a pipe by a thread. If the specified minimum number of bytes can not be immediately satisfied, then the operation will either fail immediately or attempt to send as many bytes as possible and then pend in the hope that the send can be completed later. Accepted data is either copied to the pipe's ring buffer or directly to the waiting reader(s).

Data can be asynchronously **sent** in whole using a memory block to a pipe by a thread. Once the pipe has accepted all the bytes in the memory block, it will free the memory block and may give a semaphore if one was specified.

Data can be synchronously **received** from a pipe by a thread. If the specified minimum number of bytes can not be immediately satisfied, then the operation will either fail immediately or attempt to receive as many bytes as possible and then pend in the hope that the receive can be completed later. Accepted data is either copied from the pipe's ring buffer or directly from the waiting sender(s).

---

**Note:** The kernel does NOT allow for an ISR to send or receive data to/from a pipe even if it does not attempt to wait for space/data.

---

**Implementation** A pipe is defined using a variable of type `k_pipe` and an optional character buffer of type `unsigned char`. It must then be initialized by calling `k_pipe_init()`.

The following code defines and initializes an empty pipe that has a ring buffer capable of holding 100 bytes and is aligned to a 4-byte boundary.

```
unsigned char __aligned(4) my_ring_buffer[100];
struct k_pipe my_pipe;

k_pipe_init(&my_pipe, my_ring_buffer, sizeof(my_ring_buffer));
```

Alternatively, a pipe can be defined and initialized at compile time by calling `K_PIPE_DEFINE`.

The following code has the same effect as the code segment above. Observe that that macro defines both the pipe and its ring buffer.

```
K_PIPE_DEFINE(my_pipe, 100, 4);
```

**Writing to a Pipe** Data is added to a pipe by calling `k_pipe_put()`.

The following code builds on the example above, and uses the pipe to pass data from a producing thread to one or more consuming threads. If the pipe's ring buffer fills up because the consumers can't keep up, the producing thread waits for a specified amount of time.

```
struct message_header {
    ...
};

void producer_thread(void)
{
    unsigned char *data;
    size_t total_size;
    size_t bytes_written;
    int rc;
    ...

    while (1) {
        /* Craft message to send in the pipe */
        data = ...;
        total_size = ...;

        /* send data to the consumers */
        rc = k_pipe_put(&my_pipe, data, total_size, &bytes_written,
                       sizeof(struct message_header), K_NO_WAIT);

        if (rc < 0) {
            /* Incomplete message header sent */
            ...
        } else if (bytes_written < total_size) {
            /* Some of the data was sent */
            ...
        } else {
            /* All data sent */
            ...
        }
    }
}
```

**Reading from a Pipe** Data is read from the pipe by calling `k_pipe_get()`.

The following code builds on the example above, and uses the pipe to process data items generated by one or more producing threads.

```
void consumer_thread(void)
{
    unsigned char buffer[120];
    size_t bytes_read;
    struct message_header *header = (struct message_header *)buffer;
```

(continues on next page)

(continued from previous page)

```
while (1) {
    rc = k_pipe_get(&my_pipe, buffer, sizeof(buffer), &bytes_read,
                  sizeof(header), K_MSEC(100));

    if ((rc < 0) || (bytes_read < sizeof(header))) {
        /* Incomplete message header received */
        ...
    } else if (header->num_data_bytes + sizeof(header) > bytes_read) {
        /* Only some data was received */
        ...
    } else {
        /* All data was received */
        ...
    }
}
```

**Suggested uses** Use a pipe to send streams of data between threads.

---

**Note:** A pipe can be used to transfer long streams of data if desired. However it is often preferable to send pointers to large data items to avoid copying the data. The kernel's memory map and memory pool object types can be helpful for data transfers of this sort.

---

**Configuration Options** Related configuration options:

- `:kconfig: `CONFIG_NUM_PIPE_ASYNC_MSGS``

## API Reference

group pipe\_apis

### Defines

K\_PIPE\_DEFINE(name, pipe\_buffer\_size, pipe\_align)

Statically define and initialize a pipe.

The pipe can be accessed outside the module where it is defined using:

```
extern struct k_pipe <name>;
```

### Parameters

- name – Name of the pipe.
- pipe\_buffer\_size – Size of the pipe's ring buffer (in bytes), or zero if no ring buffer is used.
- pipe\_align – Alignment of the pipe's ring buffer (power of 2).

## Functions

void `k_pipe_init`(struct [k\\_pipe](#) \*pipe, unsigned char \*buffer, size\_t size)

Initialize a pipe.

This routine initializes a pipe object, prior to its first use.

### Parameters

- `pipe` – Address of the pipe.
- `buffer` – Address of the pipe's ring buffer, or NULL if no ring buffer is used.
- `size` – Size of the pipe's ring buffer (in bytes), or zero if no ring buffer is used.

**Returns** N/A

int `k_pipe_cleanup`(struct [k\\_pipe](#) \*pipe)

Release a pipe's allocated buffer.

If a pipe object was given a dynamically allocated buffer via [k\\_pipe\\_alloc\\_init\(\)](#), this will free it. This function does nothing if the buffer wasn't dynamically allocated.

### Parameters

- `pipe` – Address of the pipe.

### Return values

- 0 – on success
- -EAGAIN – nothing to cleanup

int `k_pipe_alloc_init`(struct [k\\_pipe](#) \*pipe, size\_t size)

Initialize a pipe and allocate a buffer for it.

Storage for the buffer region will be allocated from the calling thread's resource pool. This memory will be released if [k\\_pipe\\_cleanup\(\)](#) is called, or userspace is enabled and the pipe object loses all references to it.

This function should only be called on uninitialized pipe objects.

### Parameters

- `pipe` – Address of the pipe.
- `size` – Size of the pipe's ring buffer (in bytes), or zero if no ring buffer is used.

### Return values

- 0 – on success
- -ENOMEM – if memory couldn't be allocated

int `k_pipe_put`(struct [k\\_pipe](#) \*pipe, void \*data, size\_t bytes\_to\_write, size\_t \*bytes\_written, size\_t min\_xfer, [k\\_timeout\\_t](#) timeout)

Write data to a pipe.

This routine writes up to *bytes\_to\_write* bytes of data to *pipe*.

### Parameters

- `pipe` – Address of the pipe.
- `data` – Address of data to write.
- `bytes_to_write` – Size of data (in bytes).
- `bytes_written` – Address of area to hold the number of bytes written.
- `min_xfer` – Minimum number of bytes to write.

- `timeout` – Waiting period to wait for the data to be written, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Return values**

- 0 – At least *min\_xfer* bytes of data were written.
- `-EIO` – Returned without waiting; zero data bytes were written.
- `-EAGAIN` – Waiting period timed out; between zero and *min\_xfer* minus one data bytes were written.

```
int k_pipe_get(struct k_pipe *pipe, void *data, size_t bytes_to_read, size_t *bytes_read, size_t min_xfer, k_timeout_t timeout)
```

Read data from a pipe.

This routine reads up to *bytes\_to\_read* bytes of data from *pipe*.

**Parameters**

- *pipe* – Address of the pipe.
- *data* – Address to place the data read from pipe.
- *bytes\_to\_read* – Maximum number of data bytes to read.
- *bytes\_read* – Address of area to hold the number of bytes read.
- *min\_xfer* – Minimum number of data bytes to read.
- *timeout* – Waiting period to wait for the data to be read, or one of the special values `K_NO_WAIT` and `K_FOREVER`.

**Return values**

- 0 – At least *min\_xfer* bytes of data were read.
- `-EINVAL` – invalid parameters supplied
- `-EIO` – Returned without waiting; zero data bytes were read.
- `-EAGAIN` – Waiting period timed out; between zero and *min\_xfer* minus one data bytes were read.

```
size_t k_pipe_read_avail(struct k_pipe *pipe)
```

Query the number of bytes that may be read from *pipe*.

**Parameters**

- *pipe* – Address of the pipe.

**Return values** a – number *n* such that  $0 \leq n \leq k\_pipe::size$ ; the result is zero for unbuffered pipes.

```
size_t k_pipe_write_avail(struct k_pipe *pipe)
```

Query the number of bytes that may be written to *pipe*.

**Parameters**

- *pipe* – Address of the pipe.

**Return values** a – number *n* such that  $0 \leq n \leq k\_pipe::size$ ; the result is zero for unbuffered pipes.

```
struct k_pipe
```

```
#include <kernel.h> Pipe Structure
```

## 7.13.3 Memory Management

These pages cover memory allocation and management services.

### Memory Heaps

Zephyr provides a collection of utilities that allow threads to dynamically allocate memory.

### Synchronized Heap Allocator

**Creating a Heap** The simplest way to define a heap is statically, with the `K_HEAP_DEFINE` macro. This creates a static `k_heap` variable with a given name that manages a memory region of the specified size.

Heaps can also be created to manage arbitrary regions of application-controlled memory using `k_heap_init()`.

**Allocating Memory** Memory can be allocated from a heap using `k_heap_alloc()`, passing it the address of the heap object and the number of bytes desired. This functions similarly to standard C `malloc()`, returning a NULL pointer on an allocation failure.

The heap supports blocking operation, allowing threads to go to sleep until memory is available. The final argument is a `k_timeout_t` timeout value indicating how long the thread may sleep before returning, or else one of the constant timeout values `K_NO_WAIT` or `K_FOREVER`.

**Releasing Memory** Memory allocated with `k_heap_alloc()` must be released using `k_heap_free()`. Similar to standard C `free()`, the pointer provided must be either a NULL value or a pointer previously returned by `k_heap_alloc()` for the same heap. Freeing a NULL value is defined to have no effect.

**Low Level Heap Allocator** The underlying implementation of the `k_heap` abstraction is provided a data structure named `sys_heap`. This implements exactly the same allocation semantics, but provides no kernel synchronization tools. It is available for applications that want to manage their own blocks of memory in contexts (for example, userspace) where synchronization is unavailable or more complicated. Unlike `k_heap`, all calls to any `sys_heap` functions on a single heap must be serialized by the caller. Simultaneous use from separate threads is disallowed.

**Implementation** Internally, the `sys_heap` memory block is partitioned into “chunks” of 8 bytes. All allocations are made out of a contiguous region of chunks. The first chunk of every allocation or unused block is prefixed by a chunk header that stores the length of the chunk, the length of the next lower (“left”) chunk in physical memory, a bit indicating whether the chunk is in use, and chunk-indexed link pointers to the previous and next chunk in a “free list” to which unused chunks are added.

The heap code takes reasonable care to avoid fragmentation. Free block lists are stored in “buckets” by their size, each bucket storing blocks within one power of two (i.e. a bucket for blocks of 3-4 chunks, another for 5-8, 9-16, etc. . . ) this allows new allocations to be made from the smallest/most-fragmented blocks available. Also, as allocations are freed and added to the heap, they are automatically combined with adjacent free blocks to prevent fragmentation.

All metadata is stored at the beginning of the contiguous block of heap memory, including the variable-length list of bucket list heads (which depend on heap size). The only external memory required is the `sys_heap` structure itself.

The `sys_heap` functions are unsynchronized. Care must be taken by any users to prevent concurrent access. Only one context may be inside one of the API functions at a time.

The heap code takes care to present high performance and reliable latency. All `sys_heap` API functions are guaranteed to complete within constant time. On typical architectures, they will all complete within 1-200 cycles. One complexity is that the search of the minimum bucket size for an allocation (the set of free blocks that “might fit”) has a compile-time upper bound of iterations to prevent unbounded list searches, at the expense of some fragmentation resistance. This `:c:kconfig: `CONFIG_SYS_HEAP_ALLOC_LOOPS`` value may be chosen by the user at build time, and defaults to a value of 3.

**System Heap** The *system heap* is a predefined memory allocator that allows threads to dynamically allocate memory from a common memory region in a `malloc()`-like manner.

Only a single system heap is defined. Unlike other heaps or memory pools, the system heap cannot be directly referenced using its memory address.

The size of the system heap is configurable to arbitrary sizes, subject to space availability.

A thread can dynamically allocate a chunk of heap memory by calling `k_malloc()`. The address of the allocated chunk is guaranteed to be aligned on a multiple of pointer sizes. If a suitable chunk of heap memory cannot be found NULL is returned.

When the thread is finished with a chunk of heap memory it can release the chunk back to the system heap by calling `k_free()`.

**Defining the Heap Memory Pool** The size of the heap memory pool is specified using the `:kconfig: `CONFIG_HEAP_MEM_POOL_SIZE`` configuration option.

By default, the heap memory pool size is zero bytes. This value instructs the kernel not to define the heap memory pool object. The maximum size is limited by the amount of available memory in the system. The project build will fail in the link stage if the size specified can not be supported.

**Allocating Memory** A chunk of heap memory is allocated by calling `k_malloc()`.

The following code allocates a 200 byte chunk of heap memory, then fills it with zeros. A warning is issued if a suitable chunk is not obtained.

```
char *mem_ptr;

mem_ptr = k_malloc(200);
if (mem_ptr != NULL) {
    memset(mem_ptr, 0, 200);
    ...
} else {
    printf("Memory not allocated");
}
```

**Releasing Memory** A chunk of heap memory is released by calling `k_free()`.

The following code allocates a 75 byte chunk of memory, then releases it once it is no longer needed.

```
char *mem_ptr;

mem_ptr = k_malloc(75);
... /* use memory block */
k_free(mem_ptr);
```

**Suggested Uses** Use the heap memory pool to dynamically allocate memory in a `malloc()`-like manner.

**Configuration Options** Related configuration options:

- `:kconfig: `CONFIG_HEAP_MEM_POOL_SIZE``

## API Reference

group heap\_apis

### Defines

K\_HEAP\_DEFINE(name, bytes)

Define a static [k\\_heap](#).

This macro defines and initializes a static memory region and [k\\_heap](#) of the requested size. After kernel start, &name can be used as if [k\\_heap\\_init\(\)](#) had been called.

Note that this macro enforces a minimum size on the memory region to accommodate meta-data requirements. Very small heaps will be padded to fit.

#### Parameters

- name – Symbol name for the struct [k\\_heap](#) object
- bytes – Size of memory region, in bytes

K\_HEAP\_DEFINE\_NOCACHE(name, bytes)

Define a static [k\\_heap](#) in uncached memory.

This macro defines and initializes a static memory region and [k\\_heap](#) of the requested size in uncached memory. After kernel start, &name can be used as if [k\\_heap\\_init\(\)](#) had been called.

Note that this macro enforces a minimum size on the memory region to accommodate meta-data requirements. Very small heaps will be padded to fit.

#### Parameters

- name – Symbol name for the struct [k\\_heap](#) object
- bytes – Size of memory region, in bytes

## Functions

void k\_heap\_init(struct [k\\_heap](#) \*h, void \*mem, size\_t bytes)

Initialize a [k\\_heap](#).

This constructs a synchronized [k\\_heap](#) object over a memory region specified by the user. Note that while any alignment and size can be passed as valid parameters, internal alignment restrictions inside the inner sys\_heap mean that not all bytes may be usable as allocated memory.

#### Parameters

- h – Heap struct to initialize
- mem – Pointer to memory.
- bytes – Size of memory region, in bytes

void \*k\_heap\_aligned\_alloc(struct [k\\_heap](#) \*h, size\_t align, size\_t bytes, [k\\_timeout\\_t](#) timeout)

Allocate aligned memory from a [k\\_heap](#).

Behaves in all ways like [k\\_heap\\_alloc\(\)](#), except that the returned memory (if available) will have a starting address in memory which is a multiple of the specified power-of-two alignment value in bytes. The resulting memory can be returned to the heap using [k\\_heap\\_free\(\)](#).

**Function properties (list may not be complete)** [isr-ok](#)

---

**Note:** *timeout* must be set to K\_NO\_WAIT if called from ISR.

---

---

**Note:** When CONFIG\_MULTITHREADING=n any *timeout* is treated as K\_NO\_WAIT.

---

**Parameters**

- `h` – Heap from which to allocate
- `align` – Alignment in bytes, must be a power of two
- `bytes` – Number of bytes requested
- `timeout` – How long to wait, or `K_NO_WAIT`

**Returns** Pointer to memory the caller can now use

```
void *k_heap_alloc(struct k_heap *h, size_t bytes, k_timeout_t timeout)
```

Allocate memory from a `k_heap`.

Allocates and returns a memory buffer from the memory region owned by the heap. If no memory is available immediately, the call will block for the specified timeout (constructed via the standard timeout API, or `K_NO_WAIT` or `K_FOREVER`) waiting for memory to be freed. If the allocation cannot be performed by the expiration of the timeout, `NULL` will be returned.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** *timeout* must be set to `K_NO_WAIT` if called from ISR.

---

---

**Note:** When `CONFIG_MULTITHREADING=n` any *timeout* is treated as `K_NO_WAIT`.

---

**Parameters**

- `h` – Heap from which to allocate
- `bytes` – Desired size of block to allocate
- `timeout` – How long to wait, or `K_NO_WAIT`

**Returns** A pointer to valid heap memory, or `NULL`

```
void k_heap_free(struct k_heap *h, void *mem)
```

Free memory allocated by `k_heap_alloc()`

Returns the specified memory block, which must have been returned from `k_heap_alloc()`, to the heap for use by other callers. Passing a `NULL` block is legal, and has no effect.

**Parameters**

- `h` – Heap to which to return the memory
- `mem` – A valid memory block, or `NULL`

```
void *k_aligned_alloc(size_t align, size_t size)
```

Allocate memory from the heap with a specified alignment.

This routine provides semantics similar to `aligned_alloc()`; memory is allocated from the heap with a specified alignment. However, one minor difference is that `k_aligned_alloc()` accepts any non-zero `size`, whereas `aligned_alloc()` only accepts a `size` that is an integral multiple of `align`.

Above, `aligned_alloc()` refers to: C11 standard (ISO/IEC 9899:2011): 7.22.3.1 The `aligned_alloc` function (p: 347-348)

**Parameters**

- `align` – Alignment of memory requested (in bytes).

- `size` – Amount of memory requested (in bytes).

**Returns** Address of the allocated memory if successful; otherwise NULL.

`void *k_malloc(size_t size)`

Allocate memory from the heap.

This routine provides traditional `malloc()` semantics. Memory is allocated from the heap memory pool.

**Parameters**

- `size` – Amount of memory requested (in bytes).

**Returns** Address of the allocated memory if successful; otherwise NULL.

`void k_free(void *ptr)`

Free memory allocated from heap.

This routine provides traditional `free()` semantics. The memory being returned must have been allocated from the heap memory pool or `k_mem_pool_malloc()`.

If `ptr` is NULL, no operation is performed.

**Parameters**

- `ptr` – Pointer to previously allocated memory.

**Returns** N/A

`void *k_calloc(size_t nmemb, size_t size)`

Allocate memory from heap, array style.

This routine provides traditional `calloc()` semantics. Memory is allocated from the heap memory pool and zeroed.

**Parameters**

- `nmemb` – Number of elements in the requested array
- `size` – Size of each array element (in bytes).

**Returns** Address of the allocated memory if successful; otherwise NULL.

`struct k_heap`

`#include <kernel.h>`

## Memory Slabs

A *memory slab* is a kernel object that allows memory blocks to be dynamically allocated from a designated memory region. All memory blocks in a memory slab have a single fixed size, allowing them to be allocated and released efficiently and avoiding memory fragmentation concerns.

- [Concepts](#)
  - [Internal Operation](#)
- [Implementation](#)
  - [Defining a Memory Slab](#)
  - [Allocating a Memory Block](#)
  - [Releasing a Memory Block](#)
- [Suggested Uses](#)

- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of memory slabs can be defined (limited only by available RAM). Each memory slab is referenced by its memory address.

A memory slab has the following key properties:

- The **block size** of each block, measured in bytes. It must be at least 4N bytes long, where N is greater than 0.
- The **number of blocks** available for allocation. It must be greater than zero.
- A **buffer** that provides the memory for the memory slab's blocks. It must be at least "block size" times "number of blocks" bytes long.

The memory slab's buffer must be aligned to an N-byte boundary, where N is a power of 2 larger than 2 (i.e. 4, 8, 16, ...). To ensure that all memory blocks in the buffer are similarly aligned to this boundary, the block size must also be a multiple of N.

A memory slab must be initialized before it can be used. This marks all of its blocks as unused.

A thread that needs to use a memory block simply allocates it from a memory slab. When the thread finishes with a memory block, it must release the block back to the memory slab so the block can be reused.

If all the blocks are currently in use, a thread can optionally wait for one to become available. Any number of threads may wait on an empty memory slab simultaneously; when a memory block becomes available, it is given to the highest-priority thread that has waited the longest.

Unlike a heap, more than one memory slab can be defined, if needed. This allows for a memory slab with smaller blocks and others with larger-sized blocks. Alternatively, a memory pool object may be used.

**Internal Operation** A memory slab's buffer is an array of fixed-size blocks, with no wasted space between the blocks.

The memory slab keeps track of unallocated blocks using a linked list; the first 4 bytes of each unused block provide the necessary linkage.

## Implementation

**Defining a Memory Slab** A memory slab is defined using a variable of type `k_mem_slab`. It must then be initialized by calling `k_mem_slab_init()`.

The following code defines and initializes a memory slab that has 6 blocks that are 400 bytes long, each of which is aligned to a 4-byte boundary.

```
struct k_mem_slab my_slab;
char __aligned(4) my_slab_buffer[6 * 400];

k_mem_slab_init(&my_slab, my_slab_buffer, 400, 6);
```

Alternatively, a memory slab can be defined and initialized at compile time by calling `K_MEM_SLAB_DEFINE`.

The following code has the same effect as the code segment above. Observe that the macro defines both the memory slab and its buffer.

```
K_MEM_SLAB_DEFINE(my_slab, 400, 6, 4);
```

**Allocating a Memory Block** A memory block is allocated by calling `k_mem_slab_alloc()`.

The following code builds on the example above, and waits up to 100 milliseconds for a memory block to become available, then fills it with zeroes. A warning is printed if a suitable block is not obtained.

```
char *block_ptr;

if (k_mem_slab_alloc(&my_slab, &block_ptr, 100) == 0) {
    memset(block_ptr, 0, 400);
    ...
} else {
    printf("Memory allocation time-out");
}
```

**Releasing a Memory Block** A memory block is released by calling `k_mem_slab_free()`.

The following code builds on the example above, and allocates a memory block, then releases it once it is no longer needed.

```
char *block_ptr;

k_mem_slab_alloc(&my_slab, &block_ptr, K_FOREVER);
... /* use memory block pointed at by block_ptr */
k_mem_slab_free(&my_slab, &block_ptr);
```

**Suggested Uses** Use a memory slab to allocate and free memory in fixed-size blocks.

Use memory slab blocks when sending large amounts of data from one thread to another, to avoid unnecessary copying of the data.

**Configuration Options** Related configuration options:

- `:kconfig: CONFIG_MEM_SLAB_TRACE_MAX_UTILIZATION`

## API Reference

group mem\_slab\_apis

### Defines

`K_MEM_SLAB_DEFINE(name, slab_block_size, slab_num_blocks, slab_align)`

Statically define and initialize a memory slab.

The memory slab's buffer contains `slab_num_blocks` memory blocks that are `slab_block_size` bytes long. The buffer is aligned to a `slab_align`-byte boundary. To ensure that each memory block is similarly aligned to this boundary, `slab_block_size` must also be a multiple of `slab_align`.

The memory slab can be accessed outside the module where it is defined using:

```
extern struct k_mem_slab <name>;
```

### Parameters

- `name` – Name of the memory slab.
- `slab_block_size` – Size of each memory block (in bytes).

- `slab_num_blocks` – Number memory blocks.
- `slab_align` – Alignment of the memory slab's buffer (power of 2).

## Functions

`int k_mem_slab_init(struct k_mem_slab *slab, void *buffer, size_t block_size, uint32_t num_blocks)`

Initialize a memory slab.

Initializes a memory slab, prior to its first use.

The memory slab's buffer contains `slab_num_blocks` memory blocks that are `slab_block_size` bytes long. The buffer must be aligned to an N-byte boundary matching a word boundary, where N is a power of 2 (i.e. 4 on 32-bit systems, 8, 16, ...). To ensure that each memory block is similarly aligned to this boundary, `slab_block_size` must also be a multiple of N.

### Parameters

- `slab` – Address of the memory slab.
- `buffer` – Pointer to buffer used for the memory blocks.
- `block_size` – Size of each memory block (in bytes).
- `num_blocks` – Number of memory blocks.

### Return values

- 0 – on success
- -EINVAL – invalid data supplied

`int k_mem_slab_alloc(struct k_mem_slab *slab, void **mem, k\_timeout\_t timeout)`

Allocate memory from a memory slab.

This routine allocates a memory block from a memory slab.

## Function properties (list may not be complete) [isr-ok](#)

---

**Note:** `timeout` must be set to `K_NO_WAIT` if called from ISR.

---

---

**Note:** When `CONFIG_MULTITHREADING=n` any `timeout` is treated as `K_NO_WAIT`.

---

### Parameters

- `slab` – Address of the memory slab.
- `mem` – Pointer to block address area.
- `timeout` – Non-negative waiting period to wait for operation to complete. Use `K_NO_WAIT` to return without waiting, or `K_FOREVER` to wait as long as necessary.

### Return values

- 0 – Memory allocated. The block address area pointed at by `mem` is set to the starting address of the memory block.
- -ENOMEM – Returned without waiting.
- -EAGAIN – Waiting period timed out.

- -EINVAL – Invalid data supplied

```
void k_mem_slab_free(struct k_mem_slab *slab, void **mem)
```

Free memory allocated from a memory slab.

This routine releases a previously allocated memory block back to its associated memory slab.

**Parameters**

- `slab` – Address of the memory slab.
- `mem` – Pointer to block address area (as set by [k\\_mem\\_slab\\_alloc\(\)](#)).

**Returns** N/A

```
static inline uint32_t k_mem_slab_num_used_get(struct k_mem_slab *slab)
```

Get the number of used blocks in a memory slab.

This routine gets the number of memory blocks that are currently allocated in *slab*.

**Parameters**

- `slab` – Address of the memory slab.

**Returns** Number of allocated memory blocks.

```
static inline uint32_t k_mem_slab_max_used_get(struct k_mem_slab *slab)
```

Get the number of maximum used blocks so far in a memory slab.

This routine gets the maximum number of memory blocks that were allocated in *slab*.

**Parameters**

- `slab` – Address of the memory slab.

**Returns** Maximum number of allocated memory blocks.

```
static inline uint32_t k_mem_slab_num_free_get(struct k_mem_slab *slab)
```

Get the number of unused blocks in a memory slab.

This routine gets the number of memory blocks that are currently unallocated in *slab*.

**Parameters**

- `slab` – Address of the memory slab.

**Returns** Number of unallocated memory blocks.

## 7.13.4 Timing

These pages cover timing related services.

### Kernel Timing

Zephyr provides a robust and scalable timing framework to enable reporting and tracking of timed events from hardware timing sources of arbitrary precision.

**Time Units** Kernel time is tracked in several units which are used for different purposes.

Real time values, typically specified in milliseconds or microseconds, are the default presentation of time to application code. They have the advantages of being universally portable and pervasively understood, though they may not match the precision of the underlying hardware perfectly.

The kernel presents a “cycle” count via the [k\\_cycle\\_get\\_32\(\)](#) API. The intent is that this counter represents the fastest cycle counter that the operating system is able to present to the user (for example, a CPU

cycle counter) and that the read operation is very fast. The expectation is that very sensitive application code might use this in a polling manner to achieve maximal precision. The frequency of this counter is required to be steady over time, and is available from `sys_clock_hw_cycles_per_sec()` (which on almost all platforms is a runtime constant that evaluates to `CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC`).

For asynchronous timekeeping, the kernel defines a “ticks” concept. A “tick” is the internal count in which the kernel does all its internal uptime and timeout bookkeeping. Interrupts are expected to be delivered on tick boundaries to the extent practical, and no fractional ticks are tracked. The choice of tick rate is configurable via `:c:kconfig: `CONFIG_SYS_CLOCK_TICKS_PER_SEC``. Defaults on most hardware platforms (ones that support setting arbitrary interrupt timeouts) are expected to be in the range of 10 kHz, with software emulation platforms and legacy drivers using a more traditional 100 Hz value.

**Conversion** Zephyr provides an extensively enumerated conversion library with rounding control for all time units. Any unit of “ms” (milliseconds), “us” (microseconds), “tick”, or “cyc” can be converted to any other. Control of rounding is provided, and each conversion is available in “floor” (round down to nearest output unit), “ceil” (round up) and “near” (round to nearest). Finally the output precision can be specified as either 32 or 64 bits.

For example: `k_ms_to_ticks_ceil32()` will convert a millisecond input value to the next higher number of ticks, returning a result truncated to 32 bits of precision; and `k_cyc_to_us_floor64()` will convert a measured cycle count to an elapsed number of microseconds in a full 64 bits of precision. See the reference documentation for the full enumeration of conversion routines.

On most platforms, where the various counter rates are integral multiples of each other and where the output fits within a single word, these conversions expand to a 2-4 operation sequence, requiring full precision only where actually required and requested.

**Uptime** The kernel tracks a system uptime count on behalf of the application. This is available at all times via `k_uptime_get()`, which provides an uptime value in milliseconds since system boot. This is expected to be the utility used by most portable application code.

The internal tracking, however, is as a 64 bit integer count of ticks. Apps with precise timing requirements (that are willing to do their own conversions to portable real time units) may access this with `k_uptime_ticks()`.

**Timeouts** The Zephyr kernel provides many APIs with a “timeout” parameter. Conceptually, this indicates the time at which an event will occur. For example:

- Kernel blocking operations like `k_sem_take()` or `k_queue_get()` may provide a timeout after which the routine will return with an error code if no data is available.
- Kernel `k_timer` objects must specify delays for their duration and period.
- The kernel `k_work_delayable` API provides a timeout parameter indicating when a work queue item will be added to the system queue.

All these values are specified using a `k_timeout_t` value. This is an opaque struct type that must be initialized using one of a family of kernel timeout macros. The most common, `K_MSEC`, defines a time in milliseconds after the current time (strictly: the time at which the kernel receives the timeout value).

Other options for timeout initialization follow the unit conventions described above: `K_NSEC()`, `K_USEC`, `K_TICKS` and `K_CYC()` specify timeout values that will expire after specified numbers of nanoseconds, microseconds, ticks and cycles, respectively.

Precision of `k_timeout_t` values is configurable, with the default being 32 bits. Large uptime counts in non-tick units will experience complicated rollover semantics, so it is expected that timing-sensitive applications with long uptimes will be configured to use a 64 bit timeout type.

Finally, it is possible to specify timeouts as absolute times since system boot. A timeout initialized with `K_TIMEOUT_ABS_MS` indicates a timeout that will expire after the system uptime reaches the specified value. There are likewise nanosecond, microsecond, cycles and ticks variants of this API.

## Timing Internals

**Timeout Queue** All Zephyr `k_timeout_t` events specified using the API above are managed in a single, global queue of events. Each event is stored in a double-linked list, with an attendant delta count in ticks from the previous event. The action to take on an event is specified as a callback function pointer provided by the subsystem requesting the event, along with a `_timeout` tracking struct that is expected to be embedded within subsystem-defined data structures (for example: a `wait_q` struct, or a `k_tid_t` thread struct).

Note that all variant units passed via a `k_timeout_t` are converted to ticks once on insertion into the list. There are no multiple-conversion steps internal to the kernel, so precision is guaranteed at the tick level no matter how many events exist or how long a timeout might be.

Note that the list structure means that the CPU work involved in managing large numbers of timeouts is quadratic in the number of active timeouts. The API design of the timeout queue was intended to permit a more scalable backend data structure, but no such implementation exists currently.

**Timer Drivers** Kernel timing at the tick level is driven by a timer driver with a comparatively simple API.

- The driver is expected to be able to “announce” new ticks to the kernel via the `sys_clock_announce()` call, which passes an integer number of ticks that have elapsed since the last announce call (or system boot). These calls can occur at any time, but the driver is expected to attempt to ensure (to the extent practical given interrupt latency interactions) that they occur near tick boundaries (i.e. not “halfway through” a tick), and most importantly that they be correct over time and subject to minimal skew vs. other counters and real world time.
- The driver is expected to provide a `sys_clock_set_timeout()` call to the kernel which indicates how many ticks may elapse before the kernel must receive an announce call to trigger registered timeouts. It is legal to announce new ticks before that moment (though they must be correct) but delay after that will cause events to be missed. Note that the timeout value passed here is in a delta from current time, but that does not absolve the driver of the requirement to provide ticks at a steady rate over time. Naive implementations of this function are subject to bugs where the fractional tick gets “reset” incorrectly and causes clock skew.
- The driver is expected to provide a `sys_clock_elapsed()` call which provides a current indication of how many ticks have elapsed (as compared to a real world clock) since the last call to `sys_clock_announce()`, which the kernel needs to test newly arriving timeouts for expiration.

Note that a natural implementation of this API results in a “tickless” kernel, which receives and processes timer interrupts only for registered events, relying on programmable hardware counters to provide irregular interrupts. But a traditional, “ticked” or “dumb” counter driver can be trivially implemented also:

- The driver can receive interrupts at a regular rate corresponding to the OS tick rate, calling `sys_clock_announce()` with an argument of one each time.
- The driver can ignore calls to `sys_clock_set_timeout()`, as every tick will be announced regardless of timeout status.
- The driver can return zero for every call to `sys_clock_elapsed()` as no more than one tick can be detected as having elapsed (because otherwise an interrupt would have been received).

**SMP Details** In general, the timer API described above does not change when run in a multiprocessor context. The kernel will internally synchronize all access appropriately, and ensure that all critical sections are small and minimal. But some notes are important to detail:

- Zephyr is agnostic about which CPU services timer interrupts. It is not illegal (though probably undesirable in some circumstances) to have every timer interrupt handled on a single processor. Existing SMP architectures implement symmetric timer drivers.

- The `sys_clock_announce()` call is expected to be globally synchronized at the driver level. The kernel does not do any per-CPU tracking, and expects that if two timer interrupts fire near simultaneously, that only one will provide the current tick count to the timing subsystem. The other may legally provide a tick count of zero if no ticks have elapsed. It should not “skip” the announce call because of timeslicing requirements (see below).
- Some SMP hardware uses a single, global timer device, others use a per-CPU counter. The complexity here (for example: ensuring counter synchronization between CPUs) is expected to be managed by the driver, not the kernel.
- The next timeout value passed back to the driver via `sys_clock_set_timeout()` is done identically for every CPU. So by default, every CPU will see simultaneous timer interrupts for every event, even though by definition only one of them should see a non-zero ticks argument to `sys_clock_announce()`. This is probably a correct default for timing sensitive applications (because it minimizes the chance that an errant ISR or interrupt lock will delay a timeout), but may be a performance problem in some cases. The current design expects that any such optimization is the responsibility of the timer driver.

**Time Slicing** An auxiliary job of the timing subsystem is to provide tick counters to the scheduler that allow implementation of time slicing of threads. A thread time-slice cannot be a timeout value, as it does not reflect a global expiration but instead a per-CPU value that needs to be tracked independently on each CPU in an SMP context.

Because there may be no other hardware available to drive timeslicing, Zephyr multiplexes the existing timer driver. This means that the value passed to `sys_clock_set_timeout()` may be clamped to a smaller value than the current next timeout when a time sliced thread is currently scheduled.

**Subsystems that keep millisecond APIs** In general, code like this will port just like applications code will. Millisecond values from the user may be treated any way the subsystem likes, and then converted into kernel timeouts using `K_MSEC()` at the point where they are presented to the kernel.

Obviously this comes at the cost of not being able to use new features, like the higher precision timeout constructors or absolute timeouts. But for many subsystems with simple needs, this may be acceptable.

One complexity is `K_FOREVER`. Subsystems that might have been able to accept this value to their millisecond API in the past no longer can, because it is no longer an integral type. Such code will need to use a different, integer-valued token to represent “forever”. `K_NO_WAIT` has the same typesafety concern too, of course, but as it is (and has always been) simply a numerical zero, it has a natural porting path.

**Subsystems using `k_timeout_t`** Ideally, code that takes a “timeout” parameter specifying a time to wait should be using the kernel native abstraction where possible. But `k_timeout_t` is opaque, and needs to be converted before it can be inspected by an application.

Some conversions are simple. Code that needs to test for `K_FOREVER` can simply use the `K_TIMEOUT_EQ()` macro to test the opaque struct for equality and take special action.

The more complicated case is when the subsystem needs to take a timeout and loop, waiting for it to finish while doing some processing that may require multiple blocking operations on underlying kernel code. For example, consider this design:

```
void my_wait_for_event(struct my_subsys *obj, int32_t timeout_in_ms)
{
    while (true) {
        uint32_t start = k_uptime_get_32();

        if (is_event_complete(obj)) {
            return;
        }
    }
}
```

(continues on next page)

(continued from previous page)

```
    /* Wait for notification of state change */
    k_sem_take(obj->sem, timeout_in_ms);

    /* Subtract elapsed time */
    timeout_in_ms -= (k_uptime_get_32() - start);
}
}
```

This code requires that the timeout value be inspected, which is no longer possible. For situations like this, the new API provides an internal `sys_clock_timeout_end_calc()` routine that converts an arbitrary timeout to the uptime value in ticks at which it will expire. So such a loop might look like:

```
void my_wait_for_event(struct my_subsys *obj, k_timeout_t timeout_in_ms)
{
    /* Compute the end time from the timeout */
    uint64_t end = sys_clock_timeout_end_calc(timeout_in_ms);

    while (end > k_uptime_ticks()) {
        if (is_event_complete(obj)) {
            return;
        }

        /* Wait for notification of state change */
        k_sem_take(obj->sem, timeout_in_ms);
    }
}
```

Note that `sys_clock_timeout_end_calc()` returns values in units of ticks, to prevent conversion aliasing, is always presented at 64 bit uptime precision to prevent rollover bugs, handles special `K_FOREVER` naturally (as `UINT64_MAX`), and works identically for absolute timeouts as well as conventional ones.

But some care is still required for subsystems that use it. Note that delta timeouts need to be interpreted relative to a “current time”, and obviously that time is the time of the call to `sys_clock_timeout_end_calc()`. But the user expects that the time is the time they passed the timeout to you. Care must be taken to call this function just once, as synchronously as possible to the timeout creation in user code. It should not be used on a “stored” timeout value, and should never be called iteratively in a loop.

## API Reference

group clock\_apis

Clock APIs.

### Defines

`K_NO_WAIT`

Generate null timeout delay.

This macro generates a timeout delay that instructs a kernel API not to wait if the requested operation cannot be performed immediately.

**Returns** Timeout delay value.

`K_NSEC(t)`

Generate timeout delay from nanoseconds.

This macro generates a timeout delay that instructs a kernel API to wait up to  $t$  nanoseconds to perform the requested operation. Note that timer precision is limited to the tick rate, not the requested value.

**Parameters**

- $t$  – Duration in nanoseconds.

**Returns** Timeout delay value.

**K\_USEC( $t$ )**

Generate timeout delay from microseconds.

This macro generates a timeout delay that instructs a kernel API to wait up to  $t$  microseconds to perform the requested operation. Note that timer precision is limited to the tick rate, not the requested value.

**Parameters**

- $t$  – Duration in microseconds.

**Returns** Timeout delay value.

**K\_CYC( $t$ )**

Generate timeout delay from cycles.

This macro generates a timeout delay that instructs a kernel API to wait up to  $t$  cycles to perform the requested operation.

**Parameters**

- $t$  – Duration in cycles.

**Returns** Timeout delay value.

**K\_TICKS( $t$ )**

Generate timeout delay from system ticks.

This macro generates a timeout delay that instructs a kernel API to wait up to  $t$  ticks to perform the requested operation.

**Parameters**

- $t$  – Duration in system ticks.

**Returns** Timeout delay value.

**K\_MSEC( $ms$ )**

Generate timeout delay from milliseconds.

This macro generates a timeout delay that instructs a kernel API to wait up to  $ms$  milliseconds to perform the requested operation.

**Parameters**

- $ms$  – Duration in milliseconds.

**Returns** Timeout delay value.

**K\_SECONDS( $s$ )**

Generate timeout delay from seconds.

This macro generates a timeout delay that instructs a kernel API to wait up to  $s$  seconds to perform the requested operation.

**Parameters**

- $s$  – Duration in seconds.

**Returns** Timeout delay value.

**K\_MINUTES(*m*)**

Generate timeout delay from minutes.

This macro generates a timeout delay that instructs a kernel API to wait up to *m* minutes to perform the requested operation.

**Parameters**

- *m* – Duration in minutes.

**Returns** Timeout delay value.

**K\_HOURS(*h*)**

Generate timeout delay from hours.

This macro generates a timeout delay that instructs a kernel API to wait up to *h* hours to perform the requested operation.

**Parameters**

- *h* – Duration in hours.

**Returns** Timeout delay value.

**K\_FOREVER**

Generate infinite timeout delay.

This macro generates a timeout delay that instructs a kernel API to wait as long as necessary to perform the requested operation.

**Returns** Timeout delay value.

**K\_TICKS\_FOREVER****K\_TIMEOUT\_EQ(*a*, *b*)**

Compare timeouts for equality.

The [\*k\\_timeout\\_t\*](#) object is an opaque struct that should not be inspected by application code. This macro exists so that users can test timeout objects for equality with known constants (e.g. `K_NO_WAIT` and `K_FOREVER`) when implementing their own APIs in terms of Zephyr timeout constants.

**Returns** True if the timeout objects are identical

## Typedefs

**typedef uint32\_t k\_ticks\_t**

Tick precision used in timeout APIs.

This type defines the word size of the timeout values used in [\*k\\_timeout\\_t\*](#) objects, and thus defines an upper bound on maximum timeout length (or equivalently minimum tick duration). Note that this does not affect the size of the system uptime counter, which is always a 64 bit count of ticks.

## Functions

**int sys\_clock\_driver\_init(const struct [\*device\*](#) \*dev)**

Initialize system clock driver.

The system clock is a Zephyr device created globally. This is its initialization callback. It is a weak symbol that will be implemented as a noop if undefined in the clock driver.

```
int clock_device_ctrl(const struct device *dev, enum pm\_device\_state state)
```

Initialize system clock driver.

The system clock is a Zephyr device created globally. This is its device control callback, used in a few devices for power management. It is a weak symbol that will be implemented as a noop if undefined in the clock driver.

```
void sys_clock_set_timeout(int32_t ticks, bool idle)
```

Set system clock timeout.

Informs the system clock driver that the next needed call to [sys\\_clock\\_announce\(\)](#) will not be until the specified number of ticks from the the current time have elapsed. Note that spurious calls to [sys\\_clock\\_announce\(\)](#) are allowed (i.e. it's legal to announce every tick and implement this function as a noop), the requirement is that one tick announcement should occur within one tick BEFORE the specified expiration (that is, passing ticks==1 means “announce

the next tick”, this convention was chosen to match legacy usage). Similarly a ticks value of zero (or even negative) is legal and treated identically: it simply indicates the kernel would like the next tick announcement as soon as possible.

Note that ticks can also be passed the special value K\_TICKS\_FOREVER, indicating that no future timer interrupts are expected or required and that the system is permitted to enter an indefinite sleep even if this could cause rollover of the internal counter (i.e. the system uptime counter is allowed to be wrong

Note also that it is conventional for the kernel to pass INT\_MAX for ticks if it wants to preserve the uptime tick count but doesn't have a specific event to await. The intent here is that the driver will schedule any needed timeout as far into the future as possible. For the specific case of INT\_MAX, the next call to [sys\\_clock\\_announce\(\)](#) may occur at any point in the future, not just at INT\_MAX ticks. But the correspondence between the announced ticks and real-world time must be correct.

A final note about SMP: note that the call to [sys\\_clock\\_set\\_timeout\(\)](#) is made on any CPU, and reflects the next timeout desired globally. The resulting calls(s) to [sys\\_clock\\_announce\(\)](#) must be properly serialized by the driver such that a given tick is announced exactly once across the system. The kernel does not (cannot, really) attempt to serialize things by “assigning” timeouts to specific CPUs.

#### Parameters

- `ticks` – Timeout in tick units
- `idle` – Hint to the driver that the system is about to enter the idle state immediately after setting the timeout

```
void sys_clock_idle_exit(void)
```

Timer idle exit notification.

This notifies the timer driver that the system is exiting the idle and allows it to do whatever bookkeeping is needed to restore timer operation and compute elapsed ticks.

---

**Note:** Legacy timer drivers also use this opportunity to call back into [sys\\_clock\\_announce\(\)](#) to notify the kernel of expired ticks. This is allowed for compatibility, but not recommended. The kernel will figure that out on its own.

---

```
void sys_clock_announce(int32_t ticks)
```

Announce time progress to the kernel.

Informs the kernel that the specified number of ticks have elapsed since the last call to [sys\\_clock\\_announce\(\)](#) (or system startup for the first call). The timer driver is expected to delivery these announcements as close as practical (subject to hardware and latency limitations) to tick boundaries.

**Parameters**

- `ticks` – Elapsed time, in ticks

`uint32_t sys_clock_elapsed(void)`

Ticks elapsed since last `sys_clock_announce()` call.

Queries the clock driver for the current time elapsed since the last call to `sys_clock_announce()` was made. The kernel will call this with appropriate locking, the driver needs only provide an instantaneous answer.

`int64_t k_uptime_ticks(void)`

Get system uptime, in system ticks.

This routine returns the elapsed time since the system booted, in ticks (c.f. **:kconfig: `CONFIG\_SYS\_CLOCK\_TICKS\_PER\_SEC`**), which is the fundamental unit of resolution of kernel timekeeping.

**Returns** Current uptime in ticks.

`static inline int64_t k_uptime_get(void)`

Get system uptime.

This routine returns the elapsed time since the system booted, in milliseconds.

---

**Note:** While this function returns time in milliseconds, it does not mean it has millisecond resolution. The actual resolution depends on **:kconfig: `CONFIG\_SYS\_CLOCK\_TICKS\_PER\_SEC`** config option.

---

**Returns** Current uptime in milliseconds.

`static inline uint32_t k_uptime_get_32(void)`

Get system uptime (32-bit version).

This routine returns the lower 32 bits of the system uptime in milliseconds.

Because correct conversion requires full precision of the system clock there is no benefit to using this over `k_uptime_get()` unless you know the application will never run long enough for the system clock to approach  $2^{32}$  ticks. Calls to this function may involve interrupt blocking and 64-bit math.

---

**Note:** While this function returns time in milliseconds, it does not mean it has millisecond resolution. The actual resolution depends on **:kconfig: `CONFIG\_SYS\_CLOCK\_TICKS\_PER\_SEC`** config option

---

**Returns** The low 32 bits of the current uptime, in milliseconds.

`static inline int64_t k_uptime_delta(int64_t *reftime)`

Get elapsed time.

This routine computes the elapsed time between the current system uptime and an earlier reference time, in milliseconds.

**Parameters**

- `reftime` – Pointer to a reference time, which is updated to the current uptime upon return.

**Returns** Elapsed time.

```
static inline uint32_t k_cycle_get_32(void)
```

Read the hardware clock.

This routine returns the current time, as measured by the system's hardware clock.

**Returns** Current hardware clock up-counter (in cycles).

```
struct k_timeout_t
```

*#include <sys\_clock.h>* Kernel timeout type.

Timeout arguments presented to kernel APIs are stored in this opaque type, which is capable of representing times in various formats and units. It should be constructed from application data using one of the macros defined for this purpose (e.g. [K\\_MSEC\(\)](#), [K\\_TIMEOUT\\_ABS\\_TICKS\(\)](#), etc...), or be one of the two constants [K\\_NO\\_WAIT](#) or [K\\_FOREVER](#). Applications should not inspect the internal data once constructed. Timeout values may be compared for equality with the [K\\_TIMEOUT\\_EQ\(\)](#) macro.

## Timers

A *timer* is a kernel object that measures the passage of time using the kernel's system clock. When a timer's specified time limit is reached it can perform an application-defined action, or it can simply record the expiration and wait for the application to read its status.

- [Concepts](#)
- [Implementation](#)
  - [Defining a Timer](#)
  - [Using a Timer Expiry Function](#)
  - [Reading Timer Status](#)
  - [Using Timer Status Synchronization](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of timers can be defined (limited only by available RAM). Each timer is referenced by its memory address.

A timer has the following key properties:

- A *duration* specifying the time interval before the timer expires for the first time. This is a `k_timeout_t` value that may be initialized via different units.
- A *period* specifying the time interval between all timer expirations after the first one, also a `k_timeout_t`. It must be non-negative. A period of `K_NO_WAIT` (i.e. zero) or `K_FOREVER` means that the timer is a one shot timer that stops after a single expiration. (For example then, if a timer is started with a duration of 200 and a period of 75, it will first expire after 200ms and then every 75ms after that.)
- An *expiry function* that is executed each time the timer expires. The function is executed by the system clock interrupt handler. If no expiry function is required a NULL function can be specified.
- A *stop function* that is executed if the timer is stopped prematurely while running. The function is executed by the thread that stops the timer. If no stop function is required a NULL function can be specified.

- A *status* value that indicates how many times the timer has expired since the status value was last read.

A timer must be initialized before it can be used. This specifies its expiry function and stop function values, sets the timer's status to zero, and puts the timer into the **stopped** state.

A timer is **started** by specifying a duration and a period. The timer's status is reset to zero, then the timer enters the **running** state and begins counting down towards expiry.

Note that the timer's duration and period parameters specify **minimum** delays that will elapse. Because of internal system timer precision (and potentially runtime interactions like interrupt delay) it is possible that more time may have passed as measured by reads from the relevant system time APIs. But at least this much time is guaranteed to have elapsed.

When a running timer expires its status is incremented and the timer executes its expiry function, if one exists; If a thread is waiting on the timer, it is unblocked. If the timer's period is zero the timer enters the stopped state; otherwise the timer restarts with a new duration equal to its period.

A running timer can be stopped in mid-countdown, if desired. The timer's status is left unchanged, then the timer enters the stopped state and executes its stop function, if one exists. If a thread is waiting on the timer, it is unblocked. Attempting to stop a non-running timer is permitted, but has no effect on the timer since it is already stopped.

A running timer can be restarted in mid-countdown, if desired. The timer's status is reset to zero, then the timer begins counting down using the new duration and period values specified by the caller. If a thread is waiting on the timer, it continues waiting.

A timer's status can be read directly at any time to determine how many times the timer has expired since its status was last read. Reading a timer's status resets its value to zero. The amount of time remaining before the timer expires can also be read; a value of zero indicates that the timer is stopped.

A thread may read a timer's status indirectly by **synchronizing** with the timer. This blocks the thread until the timer's status is non-zero (indicating that it has expired at least once) or the timer is stopped; if the timer status is already non-zero or the timer is already stopped the thread continues without waiting. The synchronization operation returns the timer's status and resets it to zero.

---

**Note:** Only a single user should examine the status of any given timer, since reading the status (directly or indirectly) changes its value. Similarly, only a single thread at a time should synchronize with a given timer. ISRs are not permitted to synchronize with timers, since ISRs are not allowed to block.

---

## Implementation

**Defining a Timer** A timer is defined using a variable of type `k_timer`. It must then be initialized by calling `k_timer_init()`.

The following code defines and initializes a timer.

```
struct k_timer my_timer;
extern void my_expiry_function(struct k_timer *timer_id);

k_timer_init(&my_timer, my_expiry_function, NULL);
```

Alternatively, a timer can be defined and initialized at compile time by calling `K_TIMER_DEFINE`.

The following code has the same effect as the code segment above.

```
K_TIMER_DEFINE(my_timer, my_expiry_function, NULL);
```

**Using a Timer Expiry Function** The following code uses a timer to perform a non-trivial action on a periodic basis. Since the required work cannot be done at interrupt level, the timer's expiry function submits a work item to the *system workqueue*, whose thread performs the work.

```
void my_work_handler(struct k_work *work)
{
    /* do the processing that needs to be done periodically */
    ...
}

K_WORK_DEFINE(my_work, my_work_handler);

void my_timer_handler(struct k_timer *dummy)
{
    k_work_submit(&my_work);
}

K_TIMER_DEFINE(my_timer, my_timer_handler, NULL);

...

/* start periodic timer that expires once every second */
k_timer_start(&my_timer, K_SECONDS(1), K_SECONDS(1));
```

**Reading Timer Status** The following code reads a timer's status directly to determine if the timer has expired or not.

```
K_TIMER_DEFINE(my_status_timer, NULL, NULL);

...

/* start one shot timer that expires after 200 ms */
k_timer_start(&my_status_timer, K_MSEC(200), K_NO_WAIT);

/* do work */
...

/* check timer status */
if (k_timer_status_get(&my_status_timer) > 0) {
    /* timer has expired */
} else if (k_timer_remaining_get(&my_status_timer) == 0) {
    /* timer was stopped (by someone else) before expiring */
} else {
    /* timer is still running */
}
```

**Using Timer Status Synchronization** The following code performs timer status synchronization to allow a thread to do useful work while ensuring that a pair of protocol operations are separated by the specified time interval.

```
K_TIMER_DEFINE(my_sync_timer, NULL, NULL);

...

/* do first protocol operation */
...
```

(continues on next page)

(continued from previous page)

```
/* start one shot timer that expires after 500 ms */
k_timer_start(&my_sync_timer, K_MSEC(500), K_NO_WAIT);

/* do other work */
...

/* ensure timer has expired (waiting for expiry, if necessary) */
k_timer_status_sync(&my_sync_timer);

/* do second protocol operation */
...
```

---

**Note:** If the thread had no other work to do it could simply sleep between the two protocol operations, without using a timer.

---

**Suggested Uses** Use a timer to initiate an asynchronous operation after a specified amount of time.

Use a timer to determine whether or not a specified amount of time has elapsed. In particular, timers should be used when higher precision and/or unit control is required than that afforded by the simpler `k_sleep()` and `k_usleep()` calls.

Use a timer to perform other work while carrying out operations involving time limits.

---

**Note:** If a thread needs to measure the time required to perform an operation it can read the [system clock or the hardware clock](#) directly, rather than using a timer.

---

**Configuration Options** Related configuration options:

- None

## API Reference

group timer\_apis

### Defines

K\_TIMER\_DEFINE(name, expiry\_fn, stop\_fn)

Statically define and initialize a timer.

The timer can be accessed outside the module where it is defined using:

```
extern struct k_timer <name>;
```

### Parameters

- name – Name of the timer variable.
- expiry\_fn – Function to invoke each time the timer expires.
- stop\_fn – Function to invoke if the timer is stopped while running.

## Typedefs

```
typedef void (*k_timer_expiry_t)(struct k_timer *timer)
```

Timer expiry function type.

A timer's expiry function is executed by the system clock interrupt handler each time the timer expires. The expiry function is optional, and is only invoked if the timer has been initialized with one.

**Param timer** Address of timer.

**Return** N/A

```
typedef void (*k_timer_stop_t)(struct k_timer *timer)
```

Timer stop function type.

A timer's stop function is executed if the timer is stopped prematurely. The function runs in the context of call that stops the timer. As [k\\_timer\\_stop\(\)](#) can be invoked from an ISR, the stop function must be callable from interrupt context (isr-ok).

The stop function is optional, and is only invoked if the timer has been initialized with one.

**Param timer** Address of timer.

**Return** N/A

## Functions

```
void k_timer_init(struct k_timer *timer, k\_timer\_expiry\_t expiry_fn, k\_timer\_stop\_t stop_fn)
```

Initialize a timer.

This routine initializes a timer, prior to its first use.

### Parameters

- `timer` – Address of timer.
- `expiry_fn` – Function to invoke each time the timer expires.
- `stop_fn` – Function to invoke if the timer is stopped while running.

**Returns** N/A

```
void k_timer_start(struct k_timer *timer, k\_timeout\_t duration, k\_timeout\_t period)
```

Start a timer.

This routine starts a timer, and resets its status to zero. The timer begins counting down using the specified duration and period values.

Attempting to start a timer that is already running is permitted. The timer's status is reset to zero and the timer begins counting down using the new duration and period values.

### Parameters

- `timer` – Address of timer.
- `duration` – Initial timer duration.
- `period` – Timer period.

**Returns** N/A

```
void k_timer_stop(struct k_timer *timer)
```

Stop a timer.

This routine stops a running timer prematurely. The timer's stop function, if one exists, is invoked by the caller.

Attempting to stop a timer that is not running is permitted, but has no effect on the timer.

**Function properties (list may not be complete)** *isr-ok*

---

**Note:** The stop handler has to be callable from ISRs if *k\_timer\_stop* is to be called from ISRs.

---

**Parameters**

- *timer* – Address of timer.

**Returns** N/A

```
uint32_t k_timer_status_get(struct k_timer *timer)
```

Read timer status.

This routine reads the timer's status, which indicates the number of times it has expired since its status was last read.

Calling this routine resets the timer's status to zero.

**Parameters**

- *timer* – Address of timer.

**Returns** Timer status.

```
uint32_t k_timer_status_sync(struct k_timer *timer)
```

Synchronize thread to timer expiration.

This routine blocks the calling thread until the timer's status is non-zero (indicating that it has expired at least once since it was last examined) or the timer is stopped. If the timer status is already non-zero, or the timer is already stopped, the caller continues without waiting.

Calling this routine resets the timer's status to zero.

This routine must not be used by interrupt handlers, since they are not allowed to block.

**Parameters**

- *timer* – Address of timer.

**Returns** Timer status.

```
k_ticks_t k_timer_expires_ticks(const struct k_timer *timer)
```

Get next expiration time of a timer, in system ticks.

This routine returns the future system uptime reached at the next time of expiration of the timer, in units of system ticks. If the timer is not running, current system time is returned.

**Parameters**

- *timer* – The timer object

**Returns** Uptime of expiration, in ticks

```
k_ticks_t k_timer_remaining_ticks(const struct k_timer *timer)
```

Get time remaining before a timer next expires, in system ticks.

This routine computes the time remaining before a running timer next expires, in units of system ticks. If the timer is not running, it returns zero.

```
static inline uint32_t k_timer_remaining_get(struct k_timer *timer)
```

Get time remaining before a timer next expires.

This routine computes the (approximate) time remaining before a running timer next expires. If the timer is not running, it returns zero.

#### Parameters

- `timer` – Address of timer.

**Returns** Remaining time (in milliseconds).

```
void k_timer_user_data_set(struct k_timer *timer, void *user_data)
```

Associate user-specific data with a timer.

This routine records the `user_data` with the `timer`, to be retrieved later.

It can be used e.g. in a timer handler shared across multiple subsystems to retrieve data specific to the subsystem this timer is associated with.

#### Parameters

- `timer` – Address of timer.
- `user_data` – User data to associate with the timer.

**Returns** N/A

```
void *k_timer_user_data_get(const struct k_timer *timer)
```

Retrieve the user-specific data from a timer.

#### Parameters

- `timer` – Address of timer.

**Returns** The user data.

## 7.13.5 Other

These pages cover other kernel services.

### CPU Idling

Although normally reserved for the idle thread, in certain special applications, a thread might want to make the CPU idle.

- [Concepts](#)
- [Implementation](#)
  - [Making the CPU idle](#)
  - [Making the CPU idle in an atomic fashion](#)
- [Suggested Uses](#)
- [API Reference](#)

**Concepts** Making the CPU idle causes the kernel to pause all operations until an event, normally an interrupt, wakes up the CPU. In a regular system, the idle thread is responsible for this. However, in some constrained systems, it is possible that another thread takes this duty.

### Implementation

**Making the CPU idle** Making the CPU idle is simple: call the `k_cpu_idle()` API. The CPU will stop executing instructions until an event occurs. Most likely, the function will be called within a loop. Note that in certain architectures, upon return, `k_cpu_idle()` unconditionally unmask interrupts.

```
static k_sem my_sem;

void my_isr(void *unused)
{
    k_sem_give(&my_sem);
}

void main(void)
{
    k_sem_init(&my_sem, 0, 1);

    /* wait for semaphore from ISR, then do related work */

    for (;;) {

        /* wait for ISR to trigger work to perform */
        if (k_sem_take(&my_sem, K_NO_WAIT) == 0) {

            /* ... do processing */

        }

        /* put CPU to sleep to save power */
        k_cpu_idle();
    }
}
```

**Making the CPU idle in an atomic fashion** It is possible that there is a need to do some work atomically before making the CPU idle. In such a case, `k_cpu_atomic_idle()` should be used instead.

In fact, there is a race condition in the previous example: the interrupt could occur between the time the semaphore is taken, finding out it is not available and making the CPU idle again. In some systems, this can cause the CPU to idle until *another* interrupt occurs, which might be *never*, thus hanging the system completely. To prevent this, `k_cpu_atomic_idle()` should have been used, like in this example.

```
static k_sem my_sem;

void my_isr(void *unused)
{
    k_sem_give(&my_sem);
}

void main(void)
{
    k_sem_init(&my_sem, 0, 1);

    for (;;) {

        unsigned int key = irq_lock();

        /*
         * Wait for semaphore from ISR; if acquired, do related work, then
         * go to next loop iteration (the semaphore might have been given

```

(continues on next page)

(continued from previous page)

```

    * again); else, make the CPU idle.
    */

    if (k_sem_take(&my_sem, K_NO_WAIT) == 0) {

        irq_unlock(key);

        /* ... do processing */

    } else {
        /* put CPU to sleep to save power */
        k_cpu_atomic_idle(key);
    }
}
}

```

**Suggested Uses** Use `k_cpu_atomic_idle()` when a thread has to do some real work in addition to idling the CPU to wait for an event. See example above.

Use `k_cpu_idle()` only when a thread is only responsible for idling the CPU, i.e. not doing any real work, like in this example below.

```

void main(void)
{
    /* ... do some system/application initialization */

    /* thread is only used for CPU idling from this point on */
    for (;;) {
        k_cpu_idle();
    }
}

```

---

**Note:** Do not use these APIs unless absolutely necessary. In a normal system, the idle thread takes care of power management, including CPU idling.

---

## API Reference

group `cpu_idle_apis`

### Functions

static inline void `k_cpu_idle(void)`

Make the CPU idle.

This function makes the CPU idle until an event wakes it up.

In a regular system, the idle thread should be the only thread responsible for making the CPU idle and triggering any type of power management. However, in some more constrained systems, such as a single-threaded system, the only thread would be responsible for this if needed.

---

**Note:** In some architectures, before returning, the function unmask interrupts unconditionally.

---

**Returns** N/A

static inline void `k_cpu_atomic_idle`(unsigned int key)

Make the CPU idle in an atomic fashion.

Similar to [k\\_cpu\\_idle\(\)](#), but must be called with interrupts locked.

Enabling interrupts and entering a low-power mode will be atomic, i.e. there will be no period of time where interrupts are enabled before the processor enters a low-power mode.

After waking up from the low-power mode, the interrupt lockout state will be restored as if by [irq\\_unlock\(key\)](#).

**Parameters**

- `key` – Interrupt locking key obtained from [irq\\_lock\(\)](#).

**Returns** N/A

## Atomic Services

An *atomic variable* is a 32-bit variable that can be read and modified by threads and ISRs in an uninter-ruptible manner.

- [Concepts](#)
- [Implementation](#)
  - [Defining an Atomic Variable](#)
  - [Manipulating an Atomic Variable](#)
  - [Manipulating an Array of Atomic Variables](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** Any number of atomic variables can be defined (limited only by available RAM).

Using the kernel's atomic APIs to manipulate an atomic variable guarantees that the desired operation occurs correctly, even if higher priority contexts also manipulate the same variable.

The kernel also supports the atomic manipulation of a single bit in an array of atomic variables.

## Implementation

**Defining an Atomic Variable** An atomic variable is defined using a variable of type `atomic_t`.

By default an atomic variable is initialized to zero. However, it can be given a different value using [ATOMIC\\_INIT](#):

```
atomic_t flags = ATOMIC_INIT(0xFF);
```

**Manipulating an Atomic Variable** An atomic variable is manipulated using the APIs listed at the end of this section.

The following code shows how an atomic variable can be used to keep track of the number of times a function has been invoked. Since the count is incremented atomically, there is no risk that it will become corrupted in mid-increment if a thread calling the function is interrupted if by a higher priority context that also calls the routine.

```
atomic_t call_count;

int call_counting_routine(void)
{
    /* increment invocation counter */
    atomic_inc(&call_count);

    /* do rest of routine's processing */
    ...
}
```

**Manipulating an Array of Atomic Variables** An array of 32-bit atomic variables can be defined in the conventional manner. However, you can also define an N-bit array of atomic variables using `ATOMIC_DEFINE`.

A single bit in array of atomic variables can be manipulated using the APIs listed at the end of this section that end with `_bit()`.

The following code shows how a set of 200 flag bits can be implemented using an array of atomic variables.

```
#define NUM_FLAG_BITS 200

ATOMIC_DEFINE(flag_bits, NUM_FLAG_BITS);

/* set specified flag bit & return its previous value */
int set_flag_bit(int bit_position)
{
    return (int)atomic_set_bit(flag_bits, bit_position);
}
```

**Suggested Uses** Use an atomic variable to implement critical section processing that only requires the manipulation of a single 32-bit value.

Use multiple atomic variables to implement critical section processing on a set of flag bits in a bit array longer than 32 bits.

---

**Note:** Using atomic variables is typically far more efficient than using other techniques to implement critical sections such as using a mutex or locking interrupts.

---

**Configuration Options** Related configuration options:

- `:kconfig: `CONFIG_ATOMIC_OPERATIONS_BUILTIN``
- `:kconfig: `CONFIG_ATOMIC_OPERATIONS_ARCH``
- `:kconfig: `CONFIG_ATOMIC_OPERATIONS_C``

## API Reference

**Important:** All atomic services APIs can be used by both threads and ISRs.

---

group atomic\_apis

### Defines

ATOMIC\_INIT(i)

Initialize an atomic variable.

This macro can be used to initialize an atomic variable. For example,

```
atomic_t my_var = ATOMIC_INIT(75);
```

#### Parameters

- *i* – Value to assign to atomic variable.

ATOMIC\_PTR\_INIT(p)

Initialize an atomic pointer variable.

This macro can be used to initialize an atomic pointer variable. For example,

```
atomic_ptr_t my_ptr = ATOMIC_PTR_INIT(&data);
```

#### Parameters

- *p* – Pointer value to assign to atomic pointer variable.

ATOMIC\_BITMAP\_SIZE(num\_bits)

This macro computes the number of atomic variables necessary to represent a bitmap with *num\_bits*.

#### Parameters

- *num\_bits* – Number of bits.

ATOMIC\_DEFINE(name, num\_bits)

Define an array of atomic variables.

This macro defines an array of atomic variables containing at least *num\_bits* bits.

---

**Note:** If used from file scope, the bits of the array are initialized to zero; if used from within a function, the bits are left uninitialized.

---

#### Parameters

- *name* – Name of array of atomic variables.
- *num\_bits* – Number of bits needed.

### Functions

```
static inline bool atomic_test_bit(const atomic_t *target, int bit)
```

Atomically test a bit.

This routine tests whether bit number *bit* of *target* is set or not. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).

**Returns** true if the bit was set, false if it wasn't.

```
static inline bool atomic_test_and_clear_bit(atomic_t *target, int bit)
```

Atomically test and clear a bit.

Atomically clear bit number *bit* of *target* and return its old value. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).

**Returns** true if the bit was set, false if it wasn't.

```
static inline bool atomic_test_and_set_bit(atomic_t *target, int bit)
```

Atomically set a bit.

Atomically set bit number *bit* of *target* and return its old value. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).

**Returns** true if the bit was set, false if it wasn't.

```
static inline void atomic_clear_bit(atomic_t *target, int bit)
```

Atomically clear a bit.

Atomically clear bit number *bit* of *target*. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).

**Returns** N/A

```
static inline void atomic_set_bit(atomic_t *target, int bit)
```

Atomically set a bit.

Atomically set bit number *bit* of *target*. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).

**Returns** N/A

```
static inline void atomic_set_bit_to(atomic_t *target, int bit, bool val)
```

Atomically set a bit to a given value.

Atomically set bit number *bit* of *target* to value *val*. The target may be a single atomic variable or an array of them.

**Parameters**

- *target* – Address of atomic variable or array.
- *bit* – Bit number (starting from 0).
- *val* – true for 1, false for 0.

**Returns** N/A

```
static inline bool atomic_cas(atomic_t *target, atomic_val_t old_value, atomic_val_t new_value)
```

Atomic compare-and-set.

This routine performs an atomic compare-and-set on *target*. If the current value of *target* equals *old\_value*, *target* is set to *new\_value*. If the current value of *target* does not equal *old\_value*, *target* is left unchanged.

**Parameters**

- *target* – Address of atomic variable.
- *old\_value* – Original value to compare against.
- *new\_value* – New value to store.

**Returns** true if *new\_value* is written, false otherwise.

```
static inline bool atomic_ptr_cas(atomic_ptr_t *target, atomic_ptr_val_t old_value,  
                                atomic_ptr_val_t new_value)
```

Atomic compare-and-set with pointer values.

This routine performs an atomic compare-and-set on *target*. If the current value of *target* equals *old\_value*, *target* is set to *new\_value*. If the current value of *target* does not equal *old\_value*, *target* is left unchanged.

**Parameters**

- *target* – Address of atomic variable.
- *old\_value* – Original value to compare against.
- *new\_value* – New value to store.

**Returns** true if *new\_value* is written, false otherwise.

```
static inline atomic_val_t atomic_add(atomic_t *target, atomic_val_t value)
```

Atomic addition.

This routine performs an atomic addition on *target*.

**Parameters**

- *target* – Address of atomic variable.
- *value* – Value to add.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_sub(atomic_t *target, atomic_val_t value)
```

Atomic subtraction.

This routine performs an atomic subtraction on *target*.

**Parameters**

- *target* – Address of atomic variable.

- `value` – Value to subtract.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_inc(atomic_t *target)
```

Atomic increment.

This routine performs an atomic increment by 1 on *target*.

**Parameters**

- `target` – Address of atomic variable.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_dec(atomic_t *target)
```

Atomic decrement.

This routine performs an atomic decrement by 1 on *target*.

**Parameters**

- `target` – Address of atomic variable.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_get(const atomic_t *target)
```

Atomic get.

This routine performs an atomic read on *target*.

**Parameters**

- `target` – Address of atomic variable.

**Returns** Value of *target*.

```
static inline atomic_ptr_val_t atomic_ptr_get(const atomic_ptr_t *target)
```

Atomic get a pointer value.

This routine performs an atomic read on *target*.

**Parameters**

- `target` – Address of pointer variable.

**Returns** Value of *target*.

```
static inline atomic_val_t atomic_set(atomic_t *target, atomic_val_t value)
```

Atomic get-and-set.

This routine atomically sets *target* to *value* and returns the previous value of *target*.

**Parameters**

- `target` – Address of atomic variable.
- `value` – Value to write to *target*.

**Returns** Previous value of *target*.

```
static inline atomic_ptr_val_t atomic_ptr_set(atomic_ptr_t *target, atomic_ptr_val_t value)
```

Atomic get-and-set for pointer values.

This routine atomically sets *target* to *value* and returns the previous value of *target*.

**Parameters**

- `target` – Address of atomic variable.
- `value` – Value to write to *target*.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_clear(atomic_t *target)
```

Atomic clear.

This routine atomically sets *target* to zero and returns its previous value. (Hence, it is equivalent to `atomic_set(target, 0)`.)

**Parameters**

- *target* – Address of atomic variable.

**Returns** Previous value of *target*.

```
static inline atomic_ptr_val_t atomic_ptr_clear(atomic_ptr_t *target)
```

Atomic clear of a pointer value.

This routine atomically sets *target* to zero and returns its previous value. (Hence, it is equivalent to `atomic_set(target, 0)`.)

**Parameters**

- *target* – Address of atomic variable.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_or(atomic_t *target, atomic_val_t value)
```

Atomic bitwise inclusive OR.

This routine atomically sets *target* to the bitwise inclusive OR of *target* and *value*.

**Parameters**

- *target* – Address of atomic variable.
- *value* – Value to OR.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_xor(atomic_t *target, atomic_val_t value)
```

Atomic bitwise exclusive OR (XOR).

This routine atomically sets *target* to the bitwise exclusive OR (XOR) of *target* and *value*.

**Parameters**

- *target* – Address of atomic variable.
- *value* – Value to XOR

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_and(atomic_t *target, atomic_val_t value)
```

Atomic bitwise AND.

This routine atomically sets *target* to the bitwise AND of *target* and *value*.

**Parameters**

- *target* – Address of atomic variable.
- *value* – Value to AND.

**Returns** Previous value of *target*.

```
static inline atomic_val_t atomic_nand(atomic_t *target, atomic_val_t value)
```

Atomic bitwise NAND.

This routine atomically sets *target* to the bitwise NAND of *target* and *value*. (This operation is equivalent to `target = ~(target & value)`.)

**Parameters**

- *target* – Address of atomic variable.

- `value` – Value to NAND.

**Returns** Previous value of *target*.

## Floating Point Services

The kernel allows threads to use floating point registers on board configurations that support these registers.

---

**Note:** Floating point services are currently available only for boards based on ARM Cortex-M SoCs supporting the Floating Point Extension, the Intel x86 architecture, the SPARC architecture and ARCV2 SoCs supporting the Floating Point Extension. The services provided are architecture specific.

The kernel does not support the use of floating point registers by ISRs.

---

- [Concepts](#)
  - [No FP registers mode](#)
  - [Unshared FP registers mode](#)
  - [Shared FP registers mode](#)
- [Implementation](#)
  - [Performing Floating Point Arithmetic](#)
- [Suggested Uses](#)
- [Configuration Options](#)
- [API Reference](#)

**Concepts** The kernel can be configured to provide only the floating point services required by an application. Three modes of operation are supported, which are described below. In addition, the kernel's support for the SSE registers can be included or omitted, as desired.

**No FP registers mode** This mode is used when the application has no threads that use floating point registers. It is the kernel's default floating point services mode.

If a thread uses any floating point register, the kernel generates a fatal error condition and aborts the thread.

**Unshared FP registers mode** This mode is used when the application has only a single thread that uses floating point registers.

On x86 platforms, the kernel initializes the floating point registers so they can be used by any thread (initialization is skipped on ARM Cortex-M platforms and ARCV2 platforms). The floating point registers are left unchanged whenever a context switch occurs.

---

**Note:** The behavior is undefined, if two or more threads attempt to use the floating point registers, as the kernel does not attempt to detect (or prevent) multiple threads from using these registers.

---

**Shared FP registers mode** This mode is used when the application has two or more threads that use floating point registers. Depending upon the underlying CPU architecture, the kernel supports one or more of the following thread sub-classes:

- non-user: A thread that cannot use any floating point registers
- FPU user: A thread that can use the standard floating point registers
- SSE user: A thread that can use both the standard floating point registers and SSE registers

The kernel initializes and enables access to the floating point registers, so they can be used by any thread, then saves and restores these registers during context switches to ensure the computations performed by each FPU user or SSE user are not impacted by the computations performed by the other users.

---

**ARM Cortex-M architecture (with the Floating Point Extension)**

---

**Note:** The Shared FP registers mode is the default Floating Point Services mode in ARM Cortex-M.

---

On the ARM Cortex-M architecture with the Floating Point Extension, the kernel treats *all* threads as FPU users when shared FP registers mode is enabled. This means that any thread is allowed to access the floating point registers. The ARM kernel automatically detects that a given thread is using the floating point registers the first time the thread accesses them.

Pretag a thread that intends to use the FP registers by using one of the techniques listed below.

- A statically-created ARM thread can be pretagged by passing the `K_FP_REGS` option to `K_THREAD_DEFINE`.
- A dynamically-created ARM thread can be pretagged by passing the `K_FP_REGS` option to `k_thread_create()`.

Pretagging a thread with the `K_FP_REGS` option instructs the MPU-based stack protection mechanism to properly configure the size of the thread's guard region to always guarantee stack overflow detection, and enable lazy stacking for the given thread upon thread creation.

During thread context switching the ARM kernel saves the *callee-saved* floating point registers, if the switched-out thread has been using them. Additionally, the *caller-saved* floating point registers are saved on the thread's stack. If the switched-in thread has been using the floating point registers, the kernel restores the *callee-saved* FP registers of the switched-in thread and the *caller-saved* FP context is restored from the thread's stack. Thus, the kernel does not save or restore the FP context of threads that are not using the FP registers.

Each thread that intends to use the floating point registers must provide an extra 72 bytes of stack space where the callee-saved FP context can be saved.

**Lazy Stacking** is currently enabled in Zephyr applications on ARM Cortex-M architecture, minimizing interrupt latency, when the floating point context is active.

When the MPU-based stack protection mechanism is not enabled, lazy stacking is always active in the Zephyr application. When the MPU-based stack protection is enabled, the following rules apply with respect to lazy stacking:

- Lazy stacking is activated by default on threads that are pretagged with `K_FP_REGS`
- Lazy stacking is activated dynamically on threads that are not pretagged with `K_FP_REGS`, as soon as the kernel detects that they are using the floating point registers.

If an ARM thread does not require use of the floating point registers any more, it can call `k_float_disable()`. This instructs the kernel not to save or restore its FP context during thread context switching.

### ARM64 architecture

**Note:** The Shared FP registers mode is the default Floating Point Services mode on ARM64. The compiler is free to optimize code using FP/SIMD registers, and library functions such as `memcpy` are known to make use of them.

---

On the ARM64 (Aarch64) architecture the kernel treats each thread as a FPU user on a case-by-case basis. A “lazy save” algorithm is used during context switching which updates the floating point registers only when it is absolutely necessary. For example, the registers are *not* saved when switching from an FPU user to a non-user thread, and then back to the original FPU user.

FPU register usage by ISRs is supported although not recommended. When an ISR uses floating point or SIMD registers, then the access is trapped, the current FPU user context is saved in the thread object and the ISR is resumed with interrupts disabled so to prevent another IRQ from interrupting the ISR and potentially requesting FPU usage. Because ISRs don't have a persistent register context, there are no provision for saving an ISR's FPU context either, hence the IRQ disabling.

Each thread object becomes 512 bytes larger when Shared FP registers mode is enabled.

**ARCV2 architecture** On the ARCV2 architecture, the kernel treats each thread as a non-user or FPU user and the thread must be tagged by one of the following techniques.

- A statically-created ARC thread can be tagged by passing the `K_FP_REGS` option to `K_THREAD_DEFINE`.
- A dynamically-created ARC thread can be tagged by passing the `K_FP_REGS` to `k_thread_create()`.

If an ARC thread does not require use of the floating point registers any more, it can call `k_float_disable()`. This instructs the kernel not to save or restore its FP context during thread context switching.

During thread context switching the ARC kernel saves the *callee-saved* floating point registers, if the switched-out thread has been using them. Additionally, the *caller-saved* floating point registers are saved on the thread's stack. If the switched-in thread has been using the floating point registers, the kernel restores the *callee-saved* FP registers of the switched-in thread and the *caller-saved* FP context is restored from the thread's stack. Thus, the kernel does not save or restore the FP context of threads that are not using the FP registers. An extra 16 bytes (single floating point hardware) or 32 bytes (double floating point hardware) of stack space is required to load and store floating point registers.

**RISC-V architecture** On the RISC-V architecture, the kernel treats each thread as a non-user or FPU user and the thread must be tagged by one of the following techniques:

- A statically-created RISC-V thread can be tagged by passing the `K_FP_REGS` option to `K_THREAD_DEFINE`.
- A dynamically-created RISC-V thread can be tagged by passing the `K_FP_REGS` to `k_thread_create()`.
- A running RISC-V thread can be tagged by calling `k_float_enable()`. This function can only be called from the thread itself.

If a RISC-V thread no longer requires the use of the floating point registers, it can call `k_float_disable()`. This instructs the kernel not to save or restore its FP context during thread context switching. This function can only be called from the thread itself.

During thread context switching the RISC-V kernel saves the *callee-saved* floating point registers, if the switched-out thread is tagged with `K_FP_REGS`. Additionally, the *caller-saved* floating point registers are saved on the thread's stack. If the switched-in thread has been tagged with `K_FP_REGS`, then the kernel restores the *callee-saved* FP registers of the switched-in thread and the *caller-saved* FP context is restored from the thread's stack. Thus, the kernel does not save or restore the FP context of threads that are not using the FP registers. An extra 84 bytes (single floating point hardware) or 164 bytes (double floating point hardware) of stack space is required to load and store floating point registers.

**SPARC architecture** On the SPARC architecture, the kernel treats each thread as a non-user or FPU user and the thread must be tagged by one of the following techniques:

- A statically-created thread can be tagged by passing the `K_FP_REGS` option to `K_THREAD_DEFINE`.
- A dynamically-created thread can be tagged by passing the `K_FP_REGS` to `k_thread_create()`.

During thread context switch at exit from interrupt handler, the SPARC kernel saves *all* floating point registers, if the FPU was enabled in the switched-out thread. Floating point registers are saved on the thread's stack. Floating point registers are restored when a thread context is restored iff they were saved at the context save. Saving and restoring of the floating point registers is synchronous and thus not lazy. The FPU is always disabled when an ISR is called (independent of `:kconfig: `CONFIG_FPU_SHARING``).

Floating point disabling with `k_float_disable()` is not implemented.

When `:kconfig: `CONFIG_FPU_SHARING`` is used, then 136 bytes of stack space is required for each FPU user thread to load and store floating point registers. No extra stack is required if `:kconfig: `CONFIG_FPU_SHARING`` is not used.

**x86 architecture** On the x86 architecture the kernel treats each thread as a non-user, FPU user or SSE user on a case-by-case basis. A “lazy save” algorithm is used during context switching which updates the floating point registers only when it is absolutely necessary. For example, the registers are *not* saved when switching from an FPU user to a non-user thread, and then back to the original FPU user. The following table indicates the amount of additional stack space a thread must provide so the registers can be saved properly.

Thread type	FP register use	Extra stack space required
cooperative	any	0 bytes
preemptive	none	0 bytes
preemptive	FPU	108 bytes
preemptive	SSE	464 bytes

The x86 kernel automatically detects that a given thread is using the floating point registers the first time the thread accesses them. The thread is tagged as an SSE user if the kernel has been configured to support the SSE registers, or as an FPU user if the SSE registers are not supported. If this would result in a thread that is an FPU user being tagged as an SSE user, or if the application wants to avoid the exception handling overhead involved in auto-tagging threads, it is possible to pretag a thread using one of the techniques listed below.

- A statically-created x86 thread can be pretagged by passing the `K_FP_REGS` or `K_SSE_REGS` option to `K_THREAD_DEFINE`.
- A dynamically-created x86 thread can be pretagged by passing the `K_FP_REGS` or `K_SSE_REGS` option to `k_thread_create()`.
- An already-created x86 thread can pretag itself once it has started by passing the `K_FP_REGS` or `K_SSE_REGS` option to `k_float_enable()`.

If an x86 thread uses the floating point registers infrequently it can call `k_float_disable()` to remove its tagging as an FPU user or SSE user. This eliminates the need for the kernel to take steps to preserve the contents of the floating point registers during context switches when there is no need to do so. When the thread again needs to use the floating point registers it can re-tag itself as an FPU user or SSE user by calling `k_float_enable()`.

## Implementation

**Performing Floating Point Arithmetic** No special coding is required for a thread to use floating point arithmetic if the kernel is properly configured.

The following code shows how a routine can use floating point arithmetic to avoid overflow issues when computing the average of a series of integer values.

```
int average(int *values, int num_values)
{
    double sum;
    int i;

    sum = 0.0;

    for (i = 0; i < num_values; i++) {
        sum += *values;
        values++;
    }

    return (int)((sum / num_values) + 0.5);
}
```

**Suggested Uses** Use the kernel floating point services when an application needs to perform floating point operations.

**Configuration Options** To configure unshared FP registers mode, enable the `:kconfig: `CONFIG_FPU`` configuration option and leave the `:kconfig: `CONFIG_FPU_SHARING`` configuration option disabled.

To configure shared FP registers mode, enable both the `:kconfig: `CONFIG_FPU`` configuration option and the `:kconfig: `CONFIG_FPU_SHARING`` configuration option. Also, ensure that any thread that uses the floating point registers has sufficient added stack space for saving floating point register values during context switches, as described above.

For x86, use the `:kconfig: `CONFIG_X86_SSE`` configuration option to enable support for SSE instructions.

## API Reference

group float\_apis

## C++ Support for Applications

The kernel supports applications written in both C and C++. However, to use C++ in an application you must configure the kernel to include C++ support and the build system must select the correct compiler.

The build system selects the C++ compiler based on the suffix of the files. Files identified with either a `cxx` or a `cpp` suffix are compiled using the C++ compiler. For example, `myCplusplusApp.cpp` is compiled using C++.

The kernel currently provides only a subset of C++ functionality. The following features are *not* supported:

- Dynamic object management with the `new` and `delete` operators
- RTTI (runtime type information)
- Static global object destruction

While not an exhaustive list, support for the following functionality is included:

- Inheritance
- Virtual functions

- Virtual tables
- Static global object constructors
- Exceptions

Static global object constructors are initialized after the drivers are initialized but before the application `main()` function. Therefore, use of C++ is restricted to application code.

---

**Note:** Do not use C++ for kernel, driver, or system initialization code.

---

## Version

Kernel version handling and APIs related to kernel version being used.

### API Reference

`uint32_t sys_kernel_version_get(void)`

Return the kernel version of the present build.

The kernel version is a four-byte value, whose format is described in the file “`kernel_version.h`”.

**Returns** kernel version

`SYS_KERNEL_VER_MAJOR(ver)`

`SYS_KERNEL_VER_MINOR(ver)`

`SYS_KERNEL_VER_PATCHLEVEL(ver)`

## Fatal Errors

**Software Errors Triggered in Source Code** Zephyr provides several methods for inducing fatal error conditions through either build-time checks, conditionally compiled assertions, or deliberately invoked panic or oops conditions.

**Runtime Assertions** Zephyr provides some macros to perform runtime assertions which may be conditionally compiled. Their definitions may be found in `include/sys/__assert.h`.

Assertions are enabled by setting the `__ASSERT_ON` preprocessor symbol to a non-zero value. There are two ways to do this:

- Use the `:kconfig: `CONFIG_ASSERT`` and `:kconfig: `CONFIG_ASSERT_LEVEL`` kconfig options.
- Add `-D__ASSERT_ON=<level>` to the project’s CFLAGS, either on the build command line or in a CMakeLists.txt.

The `__ASSERT_ON` method takes precedence over the kconfig option if both are used.

Specifying an assertion level of 1 causes the compiler to issue warnings that the kernel contains debug-type `__ASSERT()` statements; this reminder is issued since assertion code is not normally present in a final product. Specifying assertion level 2 suppresses these warnings.

Assertions are enabled by default when running Zephyr test cases, as configured by the `:kconfig: `CONFIG_TEST`` option.

The policy for what to do when encountering a failed assertion is controlled by the implementation of `assert_post_action()`. Zephyr provides a default implementation with weak linkage which invokes a kernel oops if the thread that failed the assertion was running in user mode, and a kernel panic otherwise.

**\_\_ASSERT()** The `__ASSERT()` macro can be used inside kernel and application code to perform optional runtime checks which will induce a fatal error if the check does not pass. The macro takes a string message which will be printed to provide context to the assertion. In addition, the kernel will print a text representation of the expression code that was evaluated, and the file and line number where the assertion can be found.

For example:

```
__ASSERT(foo == 0xFOCACC1A, "Invalid value of foo, got 0x%x", foo);
```

If at runtime `foo` had some unexpected value, the error produced may look like the following:

```
ASSERTION FAIL [foo == 0xFOCACC1A] @ ZEPHYR_BASE/tests/kernel/fatal/src/main.c:367
    Invalid value of foo, got 0xdeadbeef
[00:00:00.000,000] <err> os: r0/a1: 0x00000004 r1/a2: 0x0000016f r2/a3: 0x00000000
↳ 0x00000000
[00:00:00.000,000] <err> os: r3/a4: 0x00000000 r12/ip: 0x00000000 r14/lr: 0x00000a6d
↳ 0x00000a6d
[00:00:00.000,000] <err> os: xpsr: 0x61000000
[00:00:00.000,000] <err> os: Faulting instruction address (r15/pc): 0x00009fe4
[00:00:00.000,000] <err> os: >>> ZEPHYR FATAL ERROR 4: Kernel panic
[00:00:00.000,000] <err> os: Current thread: 0x20000414 (main)
[00:00:00.000,000] <err> os: Halting system
```

**\_\_ASSERT\_EVAL()** The `__ASSERT_EVAL()` macro can also be used inside kernel and application code, with special semantics for the evaluation of its arguments.

It makes use of the `__ASSERT()` macro, but has some extra flexibility. It allows the developer to specify different actions depending whether the `__ASSERT()` macro is enabled or not. This can be particularly useful to prevent the compiler from generating comments (errors, warnings or remarks) about variables that are only used with `__ASSERT()` being assigned a value, but otherwise unused when the `__ASSERT()` macro is disabled.

Consider the following example:

```
int x;
x = foo();
__ASSERT(x != 0, "foo() returned zero!");
```

If `__ASSERT()` is disabled, then `'x'` is assigned a value, but never used. This type of situation can be resolved using the `__ASSERT_EVAL()` macro.

```
__ASSERT_EVAL ((void) foo(),
               int x = foo(),
               x != 0,
               "foo() returned zero!");
```

The first parameter tells `__ASSERT_EVAL()` what to do if `__ASSERT()` is disabled. The second parameter tells `__ASSERT_EVAL()` what to do if `__ASSERT()` is enabled. The third and fourth parameters are the parameters it passes to `__ASSERT()`.

**\_\_ASSERT\_NO\_MSG()** The `__ASSERT_NO_MSG()` macro can be used to perform an assertion that reports the failed test and its location, but lacks additional debugging information provided to assist the user in diagnosing the problem; its use is discouraged.

**Build Assertions** Zephyr provides two macros for performing build-time assertion checks. These are evaluated completely at compile-time, and are always checked.

**BUILD\_ASSERT()** This has the same semantics as C's `_Static_assert` or C++'s `static_assert`. If the evaluation fails, a build error will be generated by the compiler. If the compiler supports it, the provided message will be printed to provide further context.

Unlike `__ASSERT()`, the message must be a static string, without `printf()`-like format codes or extra arguments.

For example, suppose this check fails:

```
BUILD_ASSERT(F00 == 2000, "Invalid value of F00");
```

With GCC, the output resembles:

```
tests/kernel/fatal/src/main.c: In function 'test_main':
include/toolchain/gcc.h:28:37: error: static assertion failed: "Invalid value of F00"
  #define BUILD_ASSERT(EXPR, MSG) _Static_assert(EXPR, "" MSG)
                                ~~~~~
tests/kernel/fatal/src/main.c:370:2: note: in expansion of macro 'BUILD_ASSERT'
  BUILD_ASSERT(F00 == 2000,
  ~~~~~
```

**Kernel Oops** A kernel oops is a software triggered fatal error invoked by `k_oops()`. This should be used to indicate an unrecoverable condition in application logic.

The fatal error reason code generated will be `K_ERR_KERNEL_OOPS`.

**Kernel Panic** A kernel error is a software triggered fatal error invoked by `k_panic()`. This should be used to indicate that the Zephyr kernel is in an unrecoverable state. Implementations of `k_sys_fatal_error_handler()` should not return if the kernel encounters a panic condition, as the entire system needs to be reset.

Threads running in user mode are not permitted to invoke `k_panic()`, and doing so will generate a kernel oops instead. Otherwise, the fatal error reason code generated will be `K_ERR_KERNEL_PANIC`.

## Exceptions

**Spurious Interrupts** If the CPU receives a hardware interrupt on an interrupt line that has not had a handler installed with `IRQ_CONNECT()` or `irq_connect_dynamic()`, then the kernel will generate a fatal error with the reason code `K_ERR_SPURIOUS_IRQ()`.

**Stack Overflows** In the event that a thread pushes more data onto its execution stack than its stack buffer provides, the kernel may be able to detect this situation and generate a fatal error with a reason code of `K_ERR_STACK_CHK_FAIL`.

If a thread is running in user mode, then stack overflows are always caught, as the thread will simply not have permission to write to adjacent memory addresses outside of the stack buffer. Because this is enforced by the memory protection hardware, there is no risk of data corruption to memory that the thread would not otherwise be able to write to.

If a thread is running in supervisor mode, or if `:kconfig: CONFIG_USERSPACE` is not enabled, depending on configuration stack overflows may or may not be caught. `:kconfig: CONFIG_HW_STACK_PROTECTION` is supported on some architectures and will catch stack overflows in supervisor mode, including when handling a system call on behalf of a user thread. Typically this is implemented via dedicated CPU features, or read-only MMU/MPU guard regions placed immediately adjacent to the stack buffer. Stack overflows caught in this way can detect the overflow, but cannot guarantee against data corruption and should be treated as a very serious condition impacting the health of the entire system.

If a platform lacks memory management hardware support, `:kconfig: `CONFIG_STACK_SENTINEL`` is a software-only stack overflow detection feature which periodically checks if a sentinel value at the end of the stack buffer has been corrupted. It does not require hardware support, but provides no protection against data corruption. Since the checks are typically done at interrupt exit, the overflow may be detected a nontrivial amount of time after the stack actually overflowed.

Finally, Zephyr supports GCC compiler stack canaries via `:kconfig: `CONFIG_STACK_CANARIES``. If enabled, the compiler will insert a canary value randomly generated at boot into function stack frames, checking that the canary has not been overwritten at function exit. If the check fails, the compiler invokes `__stack_chk_fail()`, whose Zephyr implementation invokes a fatal stack overflow error. An error in this case does not indicate that the entire stack buffer has overflowed, but instead that the current function stack frame has been corrupted. See the compiler documentation for more details.

**Other Exceptions** Any other type of unhandled CPU exception will generate an error code of `K_ERR_CPU_EXCEPTION`.

**Fatal Error Handling** The policy for what to do when encountering a fatal error is determined by the implementation of the `k_sys_fatal_error_handler()` function. This function has a default implementation with weak linkage that calls `LOG_PANIC()` to dump all pending logging messages and then unconditionally halts the system with `k_fatal_halt()`.

Applications are free to implement their own error handling policy by overriding the implementation of `k_sys_fatal_error_handler()`. If the implementation returns, the faulting thread will be aborted and the system will otherwise continue to function. See the documentation for this function for additional details and constraints.

## API Reference

group fatal\_apis

### Enums

enum k\_fatal\_error\_reason

*Values:*

enumerator K\_ERR\_CPU\_EXCEPTION

Generic CPU exception, not covered by other codes

enumerator K\_ERR\_SPURIOUS\_IRQ

Unhandled hardware interrupt

enumerator K\_ERR\_STACK\_CHK\_FAIL

Faulting context overflowed its stack buffer

enumerator K\_ERR\_KERNEL\_OOPS

Moderate severity software error

enumerator K\_ERR\_KERNEL\_PANIC

High severity software error

## Functions

`FUNC_NORETURN void k_fatal_halt(unsigned int reason)`

Halt the system on a fatal error.

Invokes architecture-specific code to power off or halt the system in a low power state. Lacking that, lock interrupts and sit in an idle loop.

### Parameters

- `reason` – Fatal exception reason code

`void k_sys_fatal_error_handler(unsigned int reason, const z_arch_esf_t *esf)`

Fatal error policy handler.

This function is not invoked by application code, but is declared as a weak symbol so that applications may introduce their own policy.

The default implementation of this function halts the system unconditionally. Depending on architecture support, this may be a simple infinite loop, power off the hardware, or exit an emulator.

If this function returns, then the currently executing thread will be aborted.

A few notes for custom implementations:

- If the error is determined to be unrecoverable, `LOG_PANIC()` should be invoked to flush any pending logging buffers.
- `K_ERR_KERNEL_PANIC` indicates a severe unrecoverable error in the kernel itself, and should not be considered recoverable. There is an assertion in `z_fatal_error()` to enforce this.
- Even outside of a kernel panic, unless the fault occurred in user mode, the kernel itself may be in an inconsistent state, with API calls to kernel objects possibly exhibiting undefined behavior or triggering another exception.

### Parameters

- `reason` – The reason for the fatal error
- `esf` – Exception context, with details and partial or full register state when the error occurred. May in some cases be `NULL`.

## Thread Local Storage (TLS)

Thread Local Storage (TLS) allows variables to be allocated on a per-thread basis. These variables are stored in the thread stack which means every thread has its own copy of these variables.

Zephyr currently requires toolchain support for TLS.

**Configuration** To enable thread local storage in Zephyr, `:kconfig: `CONFIG_THREAD_LOCAL_STORAGE`` needs to be enabled. Note that this option may not be available if the architecture or the SoC does not have the hidden option `:kconfig: `CONFIG_ARCH_HAS_THREAD_LOCAL_STORAGE`` enabled, which means the architecture or the SoC does not have the necessary code to support thread local storage and/or the toolchain does not support TLS.

`:kconfig: `CONFIG_ERRNO_IN_TLS`` can be enabled together with `:kconfig: `CONFIG_ERRNO`` to let the variable `errno` be a thread local variable. This allows user threads to access the value of `errno` without making a system call.

**Declaring and Using Thread Local Variables** The keyword `__thread` can be used to declare thread local variables.

For example, to declare a thread local variable in header files:

```
extern __thread int i;
```

And to declare the actual variable in source files:

```
__thread int i;
```

Keyword `static` can also be used to limit the variable within a source file:

```
static __thread int j;
```

Using the thread local variable is the same as using other variable, for example:

```
void testing(void) {
    i = 10;
}
```

## 7.14 C standard library

- [API Reference](#)
  - [Error numbers](#)

The [C standard library](#) is an integral part of any C program, and Zephyr provides two implementations for the application to choose from.

The first one, named “minimal libc” is part of the Zephyr code base and provides the minimal subset of the standard C library required to meet the needs of Zephyr and its subsystems and features, primarily in the areas of string manipulation and display. It is very low footprint and is suitable for projects that do not rely on less frequently used portions of the ISO C standard library. Its implementation can be found in `lib/libc/minimal` in the main zephyr tree.

The second one is [newlib](#), a complete C library implementation written for embedded systems. Newlib is separate open source project and is not included in source code form with Zephyr. Instead, the [Install the Zephyr Software Development Kit \(SDK\)](#) comes with a precompiled library for each supported architecture (`libc.a` and `libm.a`). Other 3rd-party toolchains, such as [GNU ARM Embedded](#), also bundle newlib as a precompiled library. Newlib can be enabled by selecting the `:kconfig: CONFIG_NEWLIB_LIBC` in the application configuration file. Part of the support for newlib is a set of hooks available under `lib/libc/newlib/libc-hooks.c` which integrates the C standard library with basic kernel services.

### 7.14.1 API Reference

#### Error numbers

Error numbers are used throughout Zephyr APIs to signal error conditions as return values from functions. They are typically returned as the negative value of the integer literals defined in this section, and are defined in the `errno.h` header file. A subset of the error numbers are defined in the [POSIX errno.h specification](#), and others have been added to it from other sources.

A conscious effort is made in Zephyr to keep the values of system error numbers consistent between the different implementations of the C standard library. The version of `errno.h` that is in the main zephyr tree, `errno.h`, is checked against newlib’s own list to ensure that the error numbers are kept aligned.

Below is a list of the error number definitions. For the actual numeric values please refer to [errno.h](#).

*group* system\_errno

System error numbers Error codes returned by functions. Includes a list of those defined by IEEE Std 1003.1-2017.

## Defines

errno

EPERM

Not owner

ENOENT

No such file or directory

ESRCH

No such context

EINTR

Interrupted system call

EIO

I/O error

ENXIO

No such device or address

E2BIG

Arg list too long

ENOEXEC

Exec format error

EBADF

Bad file number

ECHILD

No children

EAGAIN

No more contexts

ENOMEM

Not enough core

EACCES

Permission denied

EFAULT

Bad address

ENOTBLK

Block device required

EBUSY

Mount device busy

EEXIST

File exists

EXDEV

Cross-device link

ENODEV

No such device

ENOTDIR

Not a directory

EISDIR

Is a directory

EINVAL

Invalid argument

ENFILE

File table overflow

EMFILE

Too many open files

ENOTTY

Not a typewriter

ETXTBSY

Text file busy

EFBIG

File too large

ENOSPC

No space left on device

ESPIPE

Illegal seek

EROFS

Read-only file system

EMLINK

Too many links

EPIPE

Broken pipe

EDOM

Argument too large

ERANGE

Result too large

ENMSG

Unexpected message type

EDEADLK

Resource deadlock avoided

ENOLCK

No locks available

ENOSTR

STREAMS device required

ENODATA

Missing expected message data

ETIME

STREAMS timeout occurred

ENOSR

Insufficient memory

EPROTO

Generic STREAMS error

EBADMSG

Invalid STREAMS message

ENOSYS

Function not implemented

ENOTEMPTY

Directory not empty

ENAMETOOLONG

File name too long

ELOOP

Too many levels of symbolic links

EOPNOTSUPP

Operation not supported on socket

EPFNOSUPPORT

Protocol family not supported

ECONNRESET

Connection reset by peer

ENOBUFS

No buffer space available

EAFNOSUPPORT

Addr family not supported

EPROTOTYPE

Protocol wrong type for socket

ENOTSOCK

Socket operation on non-socket

ENOPROTOOPT

Protocol not available

ESHUTDOWN

Can't send after socket shutdown

ECONNREFUSED

Connection refused

EADDRINUSE

Address already in use

ECONNABORTED

Software caused connection abort

ENETUNREACH

Network is unreachable

ENETDOWN

Network is down

ETIMEDOUT

Connection timed out

EHOSTDOWN

Host is down

EHOSTUNREACH

No route to host

EINPROGRESS

Operation now in progress

EALREADY

Operation already in progress

EDESTADDRREQ

Destination address required

EMSGSIZE

Message size

EPROTONOSUPPORT

Protocol not supported

ESOCKTNOSUPPORT

Socket type not supported

EADDRNOTAVAIL

Can't assign requested address

ENETRESET

Network dropped connection on reset

EISCONN

Socket is already connected

ENOTCONN

Socket is not connected

ETOOMANYREFS

Too many references: can't splice

ENOTSUP

Unsupported value

EILSEQ

Illegal byte sequence

EOVERFLOW

Value overflow

ECANCELED

Operation canceled

EWouldBlock

Operation would block

## 7.15 Logging

- [\*Global Kconfig Options\*](#)
- [\*Usage\*](#)
  - [\*Logging in a module\*](#)
  - [\*Logging in a module instance\*](#)
  - [\*Controlling the logging\*](#)
- [\*Logging panic\*](#)
- [\*Architecture\*](#)
  - [\*Default Frontend\*](#)
  - [\*Custom Frontend\*](#)
  - [\*Logging strings\*](#)
  - [\*Logging backends\*](#)
  - [\*Dictionary-based Logging\*](#)
- [\*Limitations and recommendations\*](#)
  - [\*Logging v1\*](#)
  - [\*Logging v2\*](#)
- [\*Benchmark\*](#)
- [\*API Reference\*](#)
  - [\*Logger API\*](#)
  - [\*Logger control\*](#)
  - [\*Log message\*](#)
  - [\*Logger backend interface\*](#)
  - [\*Logger output formatting\*](#)

The logging API provides a common interface to process messages issued by developers. Messages are passed through a frontend and are then processed by active backends. Custom frontend and backends can be used if needed. Default configuration uses built-in frontend and UART backend.

Summary of the logging features:

- Deferred logging reduces the time needed to log a message by shifting time consuming operations to a known context instead of processing and sending the log message when called.
- Multiple backends supported (up to 9 backends).

- Custom frontend supported.
- Compile time filtering on module level.
- Run time filtering independent for each backend.
- Additional run time filtering on module instance level.
- Timestamping with user provided function.
- Dedicated API for dumping data.
- Dedicated API for handling transient strings.
- Panic support - in panic mode logging switches to blocking, synchronous processing.
- Printk support - printk message can be redirected to the logging.
- Design ready for multi-domain/multi-processor system.

Logging v2 introduces following changes:

- Option to use 64 bit timestamp
- Support for logging floating point variables
- Support for logging variables extending size of a machine word (64 bit values on 32 bit architectures)
- Remove the need for special treatment of %s format specifier
- Extend API for dumping data to accept formatted string
- Improve memory utilization. More log messages fit in the logging buffer in deferred mode.
- Log message is no longer fragmented. It is self-contained block of memory which simplifies out of domain handling (e.g. offline processing)
- Improved performance when logging from user space
- Improved performance when logging to full buffer and message are dropped.
- Slightly degrade performance in normal circumstances due to the fact that allocation from ring buffer is more complex than from memslab.
- No change in logging API
- Logging backend API extended with function for processing v2 messages.

Logging API is highly configurable at compile time as well as at run time. Using Kconfig options (see [Global Kconfig Options](#)) logs can be gradually removed from compilation to reduce image size and execution time when logs are not needed. During compilation logs can be filtered out on module basis and severity level.

Logs can also be compiled in but filtered on run time using dedicated API. Run time filtering is independent for each backend and each source of log messages. Source of log messages can be a module or specific instance of the module.

There are four severity levels available in the system: error, warning, info and debug. For each severity level the logging API ([include/logging/log.h](#)) has set of dedicated macros. Logger API also has macros for logging data.

For each level following set of macros are available:

- LOG\_X for standard printf-like messages, e.g. [LOG\\_ERR](#).
- LOG\_HEXDUMP\_X for dumping data, e.g. [LOG\\_HEXDUMP\\_WRN](#).
- LOG\_INST\_X for standard printf-like message associated with the particular instance, e.g. [LOG\\_INST\\_INF](#).
- LOG\_INST\_HEXDUMP\_X for dumping data associated with the particular instance, e.g. [LOG\\_HEXDUMP\\_INST\\_DBG](#)

There are two configuration categories: configurations per module and global configuration. When logging is enabled globally, it works for modules. However, modules can disable logging locally. Every module can specify its own logging level. The module must define the `LOG_LEVEL` macro before using the API. Unless a global override is set, the module logging level will be honored. The global override can only increase the logging level. It cannot be used to lower module logging levels that were previously set higher. It is also possible to globally limit logs by providing maximal severity level present in the system, where maximal means lowest severity (e.g. if maximal level in the system is set to `info`, it means that errors, warnings and `info` levels are present but debug messages are excluded).

Each module which is using the logging must specify its unique name and register itself to the logging. If module consists of more than one file, registration is performed in one file but each file must define a module name.

Logger's default frontend is designed to be thread safe and minimizes time needed to log the message. Time consuming operations like string formatting or access to the transport are not performed by default when logging API is called. When logging API is called a message is created and added to the list. Dedicated, configurable buffer for pool of log messages is used. There are 2 types of messages: standard and hexdump. Each message contain source ID (module or instance ID and domain ID which might be used for multiprocessor systems), timestamp and severity level. Standard message contains pointer to the string and arguments. Hexdump message contains copied data and string.

### 7.15.1 Global Kconfig Options

These options can be found in the following path `subsys/logging/Kconfig`.

**`:kconfig: CONFIG_LOG`**: Global switch, turns on/off the logging.

Mode of operations:

**`:kconfig: CONFIG_LOG_MODE_DEFERRED`**: Deferred mode.

**`:kconfig: CONFIG_LOG2_MODE_DEFERRED`**: Deferred mode v2.

**`:kconfig: CONFIG_LOG_MODE_IMMEDIATE`**: Immediate (synchronous) mode.

**`:kconfig: CONFIG_LOG2_MODE_IMMEDIATE`**: Immediate (synchronous) mode v2.

**`:kconfig: CONFIG_LOG_MODE_MINIMAL`**: Minimal footprint mode.

Filtering options:

**`:kconfig: CONFIG_LOG_RUNTIME_FILTERING`**: Enables runtime reconfiguration of the filtering.

**`:kconfig: CONFIG_LOG_DEFAULT_LEVEL`**: Default level, sets the logging level used by modules that are not setting their own logging level.

**`:kconfig: CONFIG_LOG_OVERRIDE_LEVEL`**: It overrides module logging level when it is not set or set lower than the override value.

**`:kconfig: CONFIG_LOG_MAX_LEVEL`**: Maximal (lowest severity) level which is compiled in.

Processing options:

**`:kconfig: CONFIG_LOG_MODE_OVERFLOW`**: When new message cannot be allocated, oldest one are discarded.

**`:kconfig: CONFIG_LOG_BLOCK_IN_THREAD`**: If enabled and new log message cannot be allocated thread context will block for up to **`:kconfig: CONFIG_LOG_BLOCK_IN_THREAD_TIMEOUT_MS`** or until log message is allocated.

**`:kconfig: CONFIG_LOG_PRINTK`**: Redirect `printk` calls to the logging.

**`:kconfig: CONFIG_LOG_PRINTK_MAX_STRING_LENGTH`**: Maximal string length that can be processed by `printk`. Longer strings are trimmed.

**:kconfig: `CONFIG\_LOG\_PROCESS\_TRIGGER\_THRESHOLD`**: When number of buffered log messages reaches the threshold dedicated thread (see `log_thread_set()`) is waken up. If **:kconfig: `CONFIG\_LOG\_PROCESS\_THREAD`** is enabled then this threshold is used by the internal thread.

**:kconfig: `CONFIG\_LOG\_PROCESS\_THREAD`**: When enabled, logging thread is created which handles log processing.

**:kconfig: `CONFIG\_LOG\_PROCESS\_THREAD\_STARTUP\_DELAY\_MS`**: Delay in milliseconds after which logging thread is started.

**:kconfig: `CONFIG\_LOG\_BUFFER\_SIZE`**: Number of bytes dedicated for the message pool. Single message capable of storing standard log with up to 3 arguments or hexdump message with 12 bytes of data take 32 bytes. In v2 it indicates buffer size dedicated for circular packet buffer.

**:kconfig: `CONFIG\_LOG\_DETECT\_MISSED\_STRDUP`**: Enable detection of missed transient strings handling.

**:kconfig: `CONFIG\_LOG\_STRDUP\_MAX\_STRING`**: Longest string that can be duplicated using `log_strdup()`.

**:kconfig: `CONFIG\_LOG\_STRDUP\_BUF\_COUNT`**: Number of buffers in the pool used by `log_strdup()`.

**:kconfig: `CONFIG\_LOG\_DOMAIN\_ID`**: Domain ID. Valid in multi-domain systems.

**:kconfig: `CONFIG\_LOG\_FRONTEND`**: Redirect logs to a custom frontend.

**:kconfig: `CONFIG\_LOG\_TIMESTAMP\_64BIT`**: 64 bit timestamp.

Formatting options:

**:kconfig: `CONFIG\_LOG\_FUNC\_NAME\_PREFIX\_ERR`**: Prepend standard ERROR log messages with function name. Hexdump messages are not prepended.

**:kconfig: `CONFIG\_LOG\_FUNC\_NAME\_PREFIX\_WRN`**: Prepend standard WARNING log messages with function name. Hexdump messages are not prepended.

**:kconfig: `CONFIG\_LOG\_FUNC\_NAME\_PREFIX\_INF`**: Prepend standard INFO log messages with function name. Hexdump messages are not prepended.

**:kconfig: `CONFIG\_LOG\_FUNC\_NAME\_PREFIX\_DBG`**: Prepend standard DEBUG log messages with function name. Hexdump messages are not prepended.

**:kconfig: `CONFIG\_LOG\_BACKEND\_SHOW\_COLOR`**: Enables coloring of errors (red) and warnings (yellow).

**:kconfig: `CONFIG\_LOG\_BACKEND\_FORMAT\_TIMESTAMP`**: If enabled timestamp is formatted to `hh:mm:ss:mmm,uuu`. Otherwise is printed in raw format.

Backend options:

**:kconfig: `CONFIG\_LOG\_BACKEND\_UART`**: Enabled build-in UART backend.

## 7.15.2 Usage

### Logging in a module

In order to use logging in the module, a unique name of a module must be specified and module must be registered using `LOG_MODULE_REGISTER`. Optionally, a compile time log level for the module can be specified as the second parameter. Default log level (**:kconfig: `CONFIG\_LOG\_DEFAULT\_LEVEL`**) is used if custom log level is not provided.

```
#include <logging/log.h>
LOG_MODULE_REGISTER(foo, CONFIG_FOO_LOG_LEVEL);
```

If the module consists of multiple files, then `LOG_MODULE_REGISTER()` should appear in exactly one of them. Each other file should use `LOG_MODULE_DECLARE` to declare its membership in the module. Optionally, a compile time log level for the module can be specified as the second parameter. Default log level (`:kconfig: `CONFIG_LOG_DEFAULT_LEVEL``) is used if custom log level is not provided.

```
#include <logging/log.h>
/* In all files comprising the module but one */
LOG_MODULE_DECLARE(foo, CONFIG_FOO_LOG_LEVEL);
```

In order to use logging API in a function implemented in a header file `LOG_MODULE_DECLARE` macro must be used in the function body before logging API is called. Optionally, a compile time log level for the module can be specified as the second parameter. Default log level (`:kconfig: `CONFIG_LOG_DEFAULT_LEVEL``) is used if custom log level is not provided.

```
#include <logging/log.h>

static inline void foo(void)
{
    LOG_MODULE_DECLARE(foo, CONFIG_FOO_LOG_LEVEL);

    LOG_INF("foo");
}
```

Dedicated Kconfig template (`subsys/logging/Kconfig.template.log_config`) can be used to create local log level configuration.

Example below presents usage of the template. As a result `CONFIG_FOO_LOG_LEVEL` will be generated:

```
module = FOO
module-str = foo
source "subsys/logging/Kconfig.template.log_config"
```

## Logging in a module instance

In case of modules which are multi-instance and instances are widely used across the system enabling logs will lead to flooding. Logger provide the tools which can be used to provide filtering on instance level rather than module level. In that case logging can be enabled for particular instance.

In order to use instance level filtering following steps must be performed:

- a pointer to specific logging structure is declared in instance structure. `LOG_INSTANCE_PTR_DECLARE` is used for that.

```
#include <logging/log_instance.h>

struct foo_object {
    LOG_INSTANCE_PTR_DECLARE(log);
    uint32_t id;
}
```

- module must provide macro for instantiation. In that macro, logging instance is registered and log instance pointer is initialized in the object structure.

```
#define FOO_OBJECT_DEFINE(_name) \
    LOG_INSTANCE_REGISTER(foo, _name, CONFIG_FOO_LOG_LEVEL) \
    struct foo_object _name = { \
        LOG_INSTANCE_PTR_INIT(log, foo, _name) \
    }
```

Note that when logging is disabled logging instance and pointer to that instance are not created.

In order to use the instance logging API in a source file, a compile-time log level must be set using `LOG_LEVEL_SET`.

```
LOG_LEVEL_SET(CONFIG_FOO_LOG_LEVEL);

void foo_init(foo_object *f)
{
    LOG_INST_INF(f->log, "Initialized.");
}
```

In order to use the instance logging API in a header file, a compile-time log level must be set using `LOG_LEVEL_SET`.

```
static inline void foo_init(foo_object *f)
{
    LOG_LEVEL_SET(CONFIG_FOO_LOG_LEVEL);

    LOG_INST_INF(f->log, "Initialized.");
}
```

## Controlling the logging

Logging can be controlled using API defined in `include/logging/log_ctrl.h`. Logger must be initialized before it can be used. Optionally, user can provide function which returns timestamp value. If not provided, `k_cycle_get_32` is used for timestamping. `log_process()` function is used to trigger processing of one log message (if pending). Function returns true if there is more messages pending.

Following snippet shows how logging can be processed in simple forever loop.

```
#include <log_ctrl.h>

void main(void)
{
    log_init();

    while (1) {
        if (log_process() == false) {
            /* sleep */
        }
    }
}
```

If logs are processed from a thread then it is possible to enable a feature which will wake up processing thread when certain amount of log messages are buffered (see `:kconfig: CONFIG_LOG_PROCESS_TRIGGER_THRESHOLD`). It is also possible to enable internal logging thread (see `:kconfig: CONFIG_LOG_PROCESS_THREAD`). In that case, logging thread is initialized and log messages are processed implicitly.

### 7.15.3 Logging panic

In case of error condition system usually can no longer rely on scheduler or interrupts. In that situation deferred log message processing is not an option. Logger controlling API provides a function for entering into panic mode (`log_panic()`) which should be called in such situation.

When `log_panic()` is called, `_panic_` notification is sent to all active backends. Once all backends are notified, all buffered messages are flushed. Since that moment all logs are processed in a blocking way.

### 7.15.4 Architecture

Logging consists of 3 main parts:

- Frontend
- Core
- Backends

Log message is generated by a source of logging which can be a module or instance of a module.

#### Default Frontend

Default frontend is engaged when logging API is called in a source of logging (e.g. [LOG\\_INF](#)) and is responsible for filtering a message (compile and run time), allocating buffer for the message, creating the message and committing that message. Since logging API can be called in an interrupt, frontend is optimized to log the message as fast as possible.

**Log message v1** Each log message consists of one or more fixed size chunks allocated from the pool of fixed size buffers ([Memory Slabs](#)). Message head chunk contains log entry details like: source ID, timestamp, severity level and the data (string pointer and arguments or raw data). Message contains also a reference counter which indicates how many users still uses this message. It is used to return message to the pool once last user indicates that it can be freed. If more than 3 arguments or 12 bytes of raw data is used in the log then log message is formed from multiple chunks which are linked together. When message body is filled it is put into the list. When log processing is triggered, a message is removed from the list of pending messages. If runtime filtering is disabled, the message is passed to all active backends, otherwise the message is passed to only those backends that have requested messages from that particular source (based on the source ID in the message), and severity level. Once all backends are iterated, the message is considered processed, but the message may still be in use by a backend. Because message is allocated from a pool, it is not mandatory to sequentially free messages. Processing by the backends is asynchronous and memory is freed when last user indicates that message can be freed. It also means that improper backend implementation may lead to pool drought.

**Log message v2** Log message v2 contains message descriptor (source, domain and level), timestamp, formatted string details (see [Cbprintf Packaging](#)) and optional data. Log messages v2 are stored in a continuous block of memory (contrary to v1). Memory is allocated from a circular packet buffer ([Multi Producer Single Consumer Packet Buffer](#)). It has few consequences:

- Each message is self-contained, continuous block of memory thus it is suited for copying the message (e.g. for offline processing).
- Memory is better utilized because fixed size chunks are not used.
- Messages must be sequentially freed. Backend processing is synchronous. Backend can make a copy for deferred processing.

Log message has following format:

Message Header	2 bits: MPSC packet buffer header
	1 bit: Trace/Log message flag
	3 bits: Domain ID
	3 bits: Level
	10 bits: Cbprintf Package Length
	12 bits: Data length
	1 bit: Reserved
	pointer: Pointer to the source descriptor <sup>1</sup>
	32 or 64 bits: Timestamp <sup>Page 778, 1</sup>
Cbprintf  package (optional)	Optional padding <sup>2</sup>
	Header
	Arguments
Hexdump data (optional)	Appended strings
Alignment padding (optional)	

**Log message allocation** It may happen that frontend cannot allocate a message. It happens if system is generating more log messages than it can process in certain time frame. There are two strategies to handle that case:

- No overflow - new log is dropped if space for a message cannot be allocated.
- Overflow - oldest pending messages are freed, until new message can be allocated. Enabled by **:kconfig: `CONFIG\_LOG\_MODE\_OVERFLOW`**. Note that it degrades performance thus it is recommended to adjust buffer size and amount of enabled logs to limit dropping.

**Run-time filtering** If run-time filtering is enabled, then for each source of logging a filter structure in RAM is declared. Such filter is using 32 bits divided into ten 3 bit slots. Except *slot 0*, each slot stores current filter for one backend in the system. *Slot 0* (bits 0-2) is used to aggregate maximal filter setting for given source of logging. Aggregate slot determines if log message is created for given entry since it indicates if there is at least one backend expecting that log entry. Backend slots are examined when message is processed by the core to determine if message is accepted by the given backend. Contrary to compile time filtering, binary footprint is increased because logs are compiled in.

In the example below backend 1 is set to receive errors (*slot 1*) and backend 2 up to info level (*slot 2*). Slots 3-9 are not used. Aggregated filter (*slot 0*) is set to info level and up to this level message from that particular source will be buffered.

slot 0	slot 1	slot 2	slot 3	...	slot 9
INF	ERR	INF	OFF	...	OFF

## Custom Frontend

Custom frontend is enabled using **:kconfig: `CONFIG\_LOG\_FRONTEND`**. Logs are redirected to functions declared in `include/logging/log_frontend.h`. This may be required in very time-sensitive cases, but most of the logging features cannot be used then, which includes default frontend, core and all backends features.

---

<sup>1</sup> Depending on the platform and the timestamp size fields may be swapped.

<sup>2</sup> It may be required for cbprintf package alignment

## Logging strings

**Logging v1** Since log message contains only the value of the argument, when %s is used only the address of a string is stored. Because a string variable argument could be transient, allocated on the stack, or modifiable, logger provides a mechanism and a dedicated buffer pool to hold copies of strings. The buffer size and count is configurable (see `:kconfig: `CONFIG_LOG_STRDUP_MAX_STRING`` and `:kconfig: `CONFIG_LOG_STRDUP_BUF_COUNT``).

If a string argument is transient, the user must call `log_strdup()` to duplicate the passed string into a buffer from the pool. See the examples below. If a strdup buffer cannot be allocated, a warning message is logged and an error code returned indicating `:kconfig: `CONFIG_LOG_STRDUP_BUF_COUNT`` should be increased. Buffers are freed together with the log message.

```
char local_str[] = "abc";

LOG_INF("logging transient string: %s", log_strdup(local_str));
local_str[0] = '\0'; /* String can be modified, logger will use duplicate."
```

When `:kconfig: `CONFIG_LOG_DETECT_MISSED_STRDUP`` is enabled logger will scan each log message and report if string format specifier is found and string address is not in read only memory section or does not belong to memory pool dedicated to string duplicates. It indicates that `log_strdup()` is missing in a call to log a message, such as `LOG_INF`.

**Logging v2** String arguments are handled by *Cbprintf Packaging* thus no special action is required.

## Logging backends

Logging backends are registered using `LOG_BACKEND_DEFINE`. The macro creates an instance in the dedicated memory section. Backends can be dynamically enabled (`log_backend_enable()`) and disabled. When *Run-time filtering* is enabled, `log_filter_set()` can be used to dynamically change filtering of a module logs for given backend. Module is identified by source ID and domain ID. Source ID can be retrieved if source name is known by iterating through all registered sources.

Logging supports up to 9 concurrent backends. Log message is passed to the each backend in processing phase. Additionally, backend is notified when logging enter panic mode with `log_backend_panic()`. On that call backend should switch to synchronous, interrupt-less operation or shut down itself if that is not supported. Occasionally, logging may inform backend about number of dropped messages with `log_backend_dropped()`. Message processing API is version specific.

**Logging v1** Logging backend interface contains following functions for processing:

- `log_backend_put()` - backend gets log message in deferred mode.
- `log_backend_put_sync_string()` - backend gets log message with formatted string message in the immediate mode.
- `log_backend_put_sync_hexdump()` - backend gets log message with hexdump message in the immediate mode.

The log message contains a reference counter tracking how many backends are processing the message. On receiving a message backend must claim it by calling `log_msg_get()` on that message which increments a reference counter. Once message is processed, backend puts back the message (`log_msg_put()`) decrementing a reference counter. On last `log_msg_put()`, when reference counter reaches 0, message is returned to the pool. It is up to the backend how message is processed.

**Note:** The message pool can be starved if a backend does not call `log_msg_put()` when it is done processing a message. The logging core has no means to force messages back to the pool if they're still

marked as in use (with a non-zero reference counter).

---

```
#include <log_backend.h>

void put(const struct log_backend *const backend,
        struct log_msg *msg)
{
    log_msg_get(msg);

    /* message processing */

    log_msg_put(msg);
}
```

**Logging v2** `log_backend_msg2_process()` is used for processing message. It is common for standard and hexdump messages because log message v2 hold string with arguments and data. It is also common for deferred and immediate logging.

**Message formatting** Logging provides set of function that can be used by the backend to format a message. Helper functions are available in `include/logging/log_output.h`.

Example message formatted using `log_output_msg_process()` or `log_output_msg2_process()`.

```
[00:00:00.000,274] <info> sample_instance.inst1: logging message
```

## Dictionary-based Logging

Dictionary-based logging, instead of human readable texts, outputs the log messages in binary format. This binary format encodes arguments to formatted strings in their native storage formats which can be more compact than their text equivalents. For statically defined strings (including the format strings and any string arguments), references to the ELF file are encoded instead of the whole strings. A dictionary created at build time contains the mappings between these references and the actual strings. This allows the offline parser to obtain the strings from the dictionary to parse the log messages. This binary format allows a more compact representation of log messages in certain scenarios. However, this requires the use of an offline parser and is not as intuitive to use as text-based log messages.

Note that long double is not supported by Python's struct module. Therefore, log messages with long double will not display the correct values.

**Configuration** Here are kconfig options related to dictionary-based logging:

- **:kconfig: `CONFIG\_LOG\_DICTONARY\_SUPPORT`** enables dictionary-based logging support. This should be selected by the backends which require it.
- The UART backend can be used for dictionary-based logging. These are additional config for the UART backend:
  - **:kconfig: `CONFIG\_LOG\_BACKEND\_UART\_OUTPUT\_DICTONARY\_HEX`** tells the UART backend to output hexadecimal characters for dictionary based logging. This is useful when the log data needs to be captured manually via terminals and consoles.
  - **:kconfig: `CONFIG\_LOG\_BACKEND\_UART\_OUTPUT\_DICTONARY\_BIN`** tells the UART backend to output binary data.

**Usage** When dictionary-based logging is enabled via enabling related logging backends, a JSON database file, named `log_dictionary.json`, will be created in the build directory. This database file contains information for the parser to correctly parse the log data. Note that this database file only works with the same build, and cannot be used for any other builds.

To use the log parser:

```
./scripts/logging/dictionary/log_parser.py <build dir>/log_dictionary.json <log data_
↪file>
```

The parser takes two required arguments, where the first one is the full path to the JSON database file, and the second part is the file containing log data. Add an optional argument `--hex` to the end if the log data file contains hexadecimal characters (e.g. when `CONFIG_LOG_BACKEND_UART_OUTPUT_DICTIONARY_HEX=y`). This tells the parser to convert the hexadecimal characters to binary before parsing.

Please refer to `logging_dictionary_sample` on how to use the log parser.

## 7.15.5 Limitations and recommendations

### Logging v1

The are following limitations:

- Strings as arguments (`%s`) require special treatment (see [Logging strings](#)).
- Logging double and float variables is not possible because arguments are word size.
- Variables larger than word size cannot be logged.
- Number of arguments in the string is limited to 15.

### Logging v2

Solves major limitations of v1. However, in order to get most of the logging capabilities following recommendations shall be followed:

- Enable `kconfig: CONFIG_LOG_SPEED` to slightly speed up deferred logging at the cost of slight increase in memory footprint.
- Compiler with C11 `_Generic` keyword support is recommended. Logging performance is significantly degraded without it. See [Cbprintf Packaging](#).
- When `_Generic` is supported, during compilation it is determined which packaging method shall be used: static or runtime. It is done by searching for any string pointers in the argument list. If string pointer is used with format specifier other than `string`, e.g. `%p`, it is recommended to cast it to `void *`.

```
LOG_WRN("%s", str);
LOG_WRN("%p", (void *)str);
```

## 7.15.6 Benchmark

Benchmark numbers from [tests/subsys/logging/log\\_benchmark](#) performed on `qemu_x86`. It is a rough comparison to give general overview. Overall, logging v2 improves in most a the areas with the biggest improvement in logging from userspace. It is at the cost of larger memory footprint for a log message.

Feature	v1	v2	Summary
Kernel logging	7us	7us <sup>3</sup> /11us	No significant change
User logging	86us	13us	<b>Strongly improved</b>
kernel logging with overwrite	23us	10us <sup>Page 782, 3</sup> /11us	<b>Improved</b>
Logging transient string	16us	42us	<b>Degraded</b>
Logging transient string from user	111us	50us	<b>Improved</b>
Memory utilization <sup>4</sup>	416	518	Slightly improved
Memory footprint (test) <sup>5</sup>	3.2k	2k	<b>Improved</b>
Memory footprint (application) <sup>6</sup>	6.2k	3.5k	<b>Improved</b>
Message footprint <sup>7</sup>	15 bytes	47 <sup>Page 782, 3</sup> /32 bytes	<b>Degraded</b>

## Benchmark details

### 7.15.7 API Reference

#### Logger API

group log\_api

Logger API.

#### Defines

LOG\_ERR(...)

Writes an ERROR level message to the log.

It's meant to report severe errors, such as those from which it's not possible to recover.

##### Parameters

- ... – A string optionally containing printk valid conversion specifier, followed by as many values as specifiers.

LOG\_WRN(...)

Writes a WARNING level message to the log.

It's meant to register messages related to unusual situations that are not necessarily errors.

##### Parameters

- ... – A string optionally containing printk valid conversion specifier, followed by as many values as specifiers.

LOG\_INF(...)

Writes an INFO level message to the log.

It's meant to write generic user oriented messages.

##### Parameters

- ... – A string optionally containing printk valid conversion specifier, followed by as many values as specifiers.

---

<sup>3</sup> :kconfig: `CONFIG\_LOG\_SPEED` enabled.

<sup>4</sup> Number of log messages with various number of arguments that fits in 2048 bytes dedicated for logging.

<sup>5</sup> Logging subsystem memory footprint in `tests/subsys/logging/log_benchmark` where filtering and formatting features are not used.

<sup>6</sup> Logging subsystem memory footprint in `samples/subsys/logging/logger`.

<sup>7</sup> Average size of a log message (excluding string) with 2 arguments on Cortex M3

`LOG_DBG(...)`

Writes a DEBUG level message to the log.

It's meant to write developer oriented information.

**Parameters**

- ... – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_PRINTK(...)`

Unconditionally print raw log message.

The result is same as if printf was used but it goes through logging infrastructure thus utilizes logging mode, e.g. deferred mode.

**Parameters**

- ... – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_INST_ERR(_log_inst, ...)`

Writes an ERROR level message associated with the instance to the log.

Message is associated with specific instance of the module which has independent filtering settings (if runtime filtering is enabled) and message prefix (<module\_name>.<instance\_name>). It's meant to report severe errors, such as those from which it's not possible to recover.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- ... – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_INST_WRN(_log_inst, ...)`

Writes a WARNING level message associated with the instance to the log.

Message is associated with specific instance of the module which has independent filtering settings (if runtime filtering is enabled) and message prefix (<module\_name>.<instance\_name>). It's meant to register messages related to unusual situations that are not necessarily errors.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- ... – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_INST_INF(_log_inst, ...)`

Writes an INFO level message associated with the instance to the log.

Message is associated with specific instance of the module which has independent filtering settings (if runtime filtering is enabled) and message prefix (<module\_name>.<instance\_name>). It's meant to write generic user oriented messages.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- ... – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_INST_DBG(_log_inst, ...)`

Writes a DEBUG level message associated with the instance to the log.

Message is associated with specific instance of the module which has independent filtering settings (if runtime filtering is enabled) and message prefix (<module\_name>.<instance\_name>). It's meant to write developer oriented information.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- `...` – A string optionally containing printf valid conversion specifier, followed by as many values as specifiers.

`LOG_HEXDUMP_ERR(_data, _length, _str)`

Writes an ERROR level hexdump message to the log.

It's meant to report severe errors, such as those from which it's not possible to recover.

**Parameters**

- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_HEXDUMP_WRN(_data, _length, _str)`

Writes a WARNING level message to the log.

It's meant to register messages related to unusual situations that are not necessarily errors.

**Parameters**

- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_HEXDUMP_INF(_data, _length, _str)`

Writes an INFO level message to the log.

It's meant to write generic user oriented messages.

**Parameters**

- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_HEXDUMP_DBG(_data, _length, _str)`

Writes a DEBUG level message to the log.

It's meant to write developer oriented information.

**Parameters**

- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_INST_HEXDUMP_ERR(_log_inst, _data, _length, _str)`

Writes an ERROR hexdump message associated with the instance to the log.

Message is associated with specific instance of the module which has independent filtering settings (if runtime filtering is enabled) and message prefix (<module\_name>.<instance\_name>). It's meant to report severe errors, such as those from which it's not possible to recover.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_INST_HEXDUMP_WRN(_log_inst, _data, _length, _str)`

Writes a WARNING level hexdump message associated with the instance to the log.

It's meant to register messages related to unusual situations that are not necessarily errors.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_INST_HEXDUMP_INF(_log_inst, _data, _length, _str)`

Writes an INFO level hexdump message associated with the instance to the log.

It's meant to write generic user oriented messages.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_INST_HEXDUMP_DBG(_log_inst, _data, _length, _str)`

Writes a DEBUG level hexdump message associated with the instance to the log.

It's meant to write developer oriented information.

**Parameters**

- `_log_inst` – Pointer to the log structure associated with the instance.
- `_data` – Pointer to the data to be logged.
- `_length` – Length of data (in bytes).
- `_str` – Persistent, raw string.

`LOG_MODULE_REGISTER(...)`

Create module-specific state and register the module with Logger.

This macro normally must be used after including <logging/log.h> to complete the initialization of the module.

Module registration can be skipped in two cases:

- The module consists of more than one file, and another file invokes this macro. ([LOG\\_MODULE\\_DECLARE\(\)](#) should be used instead in all of the module's other files.)
- Instance logging is used and there is no need to create module entry. In that case [LOG\\_LEVEL\\_SET\(\)](#) should be used to set log level used within the file.

Macro accepts one or two parameters:

- module name
- optional log level. If not provided then default log level is used in the file.

Example usage:

- [LOG\\_MODULE\\_REGISTER\(foo, CONFIG\\_FOO\\_LOG\\_LEVEL\)](#)
- [LOG\\_MODULE\\_REGISTER\(foo\)](#)

See also:

[LOG\\_MODULE\\_DECLARE](#)

---

**Note:** The module's state is defined, and the module is registered, only if `LOG_LEVEL` for the current source file is non-zero or it is not defined and `CONFIG_LOG_DEFAULT_LEVEL` is non-zero. In other cases, this macro has no effect.

---

`LOG_MODULE_DECLARE(...)`

Macro for declaring a log module (not registering it).

Modules which are split up over multiple files must have exactly one file use [LOG\\_MODULE\\_REGISTER\(\)](#) to create module-specific state and register the module with the logger core.

The other files in the module should use this macro instead to declare that same state. (Otherwise, [LOG\\_INFO](#) etc. will not be able to refer to module-specific state variables.)

Macro accepts one or two parameters:

- module name
- optional log level. If not provided then default log level is used in the file.

Example usage:

- [LOG\\_MODULE\\_DECLARE\(foo, CONFIG\\_FOO\\_LOG\\_LEVEL\)](#)
- [LOG\\_MODULE\\_DECLARE\(foo\)](#)

See also:

[LOG\\_MODULE\\_REGISTER](#)

---

**Note:** The module's state is declared only if `LOG_LEVEL` for the current source file is non-zero or it is not defined and `CONFIG_LOG_DEFAULT_LEVEL` is non-zero. In other cases, this macro has no effect.

---

`LOG_LEVEL_SET(level)`

Macro for setting log level in the file or function where instance logging API is used.

**Parameters**

- `level` – Level used in file or in function.

## Functions

static inline void log\_printk(const char \*fmt, va\_list ap)

static inline char \*log\_strdup(const char \*str)

## Logger control

*group* log\_ctrl

Logger control API.

## Defines

LOG\_CORE\_INIT()

LOG\_INIT()

LOG\_PANIC()

LOG\_PROCESS()

## Typedefs

typedef log\_timestamp\_t (\*log\_timestamp\_get\_t)(void)

## Functions

void log\_core\_init(void)

Function system initialization of the logger.

Function is called during start up to allow logging before user can explicitly initialize the logger.

void log\_init(void)

Function for user initialization of the logger.

void log\_thread\_set(k\_tid\_t process\_tid)

Function for providing thread which is processing logs.

See CONFIG\_LOG\_PROCESS\_TRIGGER\_THRESHOLD.

---

**Note:** Function has asserts and has no effect when CONFIG\_LOG\_PROCESS\_THREAD is set.

---

## Parameters

- process\_tid – Process thread id. Used to wake up the thread.

int log\_set\_timestamp\_func([log\\_timestamp\\_get\\_t](#) timestamp\_getter, uint32\_t freq)

Function for providing timestamp function.

## Parameters

- timestamp\_getter – Timestamp function.
- freq – Timestamping frequency.

**Returns** 0 on success or error.

void log\_panic(void)

Switch the logger subsystem to the panic mode.

Returns immediately if the logger is already in the panic mode.

On panic the logger subsystem informs all backends about panic mode. Backends must switch to blocking mode or halt. All pending logs are flushed after switching to panic mode. In panic mode, all log messages must be processed in the context of the call.

bool log\_process(bool bypass)

Process one pending log message.

**Parameters**

- `bypass` – If true message is released without being processed.

**Return values**

- `true` – There is more messages pending to be processed.
- `false` – No messages pending.

uint32\_t log\_buffered\_cnt(void)

Return number of buffered log messages.

**Returns** Number of currently buffered log messages.

uint32\_t log\_src\_cnt\_get(uint32\_t domain\_id)

Get number of independent logger sources (modules and instances)

**Parameters**

- `domain_id` – Domain ID.

**Returns** Number of sources.

const char \*log\_source\_name\_get(uint32\_t domain\_id, uint32\_t source\_id)

Get name of the source (module or instance).

**Parameters**

- `domain_id` – Domain ID.
- `source_id` – Source ID.

**Returns** Source name or NULL if invalid arguments.

const char \*log\_domain\_name\_get(uint32\_t domain\_id)

Get name of the domain.

**Parameters**

- `domain_id` – Domain ID.

**Returns** Domain name.

uint32\_t log\_filter\_get(struct [log\\_backend](#) const \*const backend, uint32\_t domain\_id, int16\_t source\_id, bool runtime)

Get source filter for the provided backend.

**Parameters**

- `backend` – Backend instance.
- `domain_id` – ID of the domain.
- `source_id` – Source (module or instance) ID.
- `runtime` – True for runtime filter or false for compiled in.

**Returns** Severity level.

```
uint32_t log_filter_set(struct log_backend const *const backend, uint32_t domain_id, int16_t
                        source_id, uint32_t level)
```

Set filter on given source for the provided backend.

**Parameters**

- `backend` – Backend instance. NULL for all backends.
- `domain_id` – ID of the domain.
- `source_id` – Source (module or instance) ID.
- `level` – Severity level.

**Returns** Actual level set which may be limited by compiled level. If filter was set for all backends then maximal level that was set is returned.

```
void log_backend_enable(struct log_backend const *const backend, void *ctx, uint32_t level)
```

Enable backend with initial maximum filtering level.

**Parameters**

- `backend` – Backend instance.
- `ctx` – User context.
- `level` – Severity level.

```
void log_backend_disable(struct log_backend const *const backend)
```

Disable backend.

**Parameters**

- `backend` – Backend instance.

## Log message

*group* `log_msg`

Log message API.

## Defines

`LOG_MAX_NARGS`

Maximum number of arguments in the standard log entry.

It is limited by 4 bit nargs field in the log message.

`LOG_MSG_NARGS_SINGLE_CHUNK`

Number of arguments in the log entry which fits in one chunk.

`LOG_MSG_NARGS_HEAD_CHUNK`

Number of arguments in the head of extended standard log message..

`LOG_MSG_HEX_DUMP_BYTES_SINGLE_CHUNK`

Maximal amount of bytes in the hexdump entry which fits in one chunk.

LOG\_MSG\_HEXDUMP\_BYTES\_HEAD\_CHUNK

Number of bytes in the first chunk of hexdump message if message consists of more than one chunk.

HEXDUMP\_BYTES\_CONT\_MSG

Number of bytes that can be stored in chunks following head chunk in hexdump log message.

ARGS\_CONT\_MSG

LOG\_MSG\_TYPE\_STD

Flag indicating standard log message.

LOG\_MSG\_TYPE\_HEXDUMP

Flag indicating hexdump log message.

COMMON\_PARAM\_HDR()

Common part of log message header.

LOG\_MSG\_HEXDUMP\_LENGTH\_BITS

Number of bits used for storing length of hexdump log message.

LOG\_MSG\_HEXDUMP\_MAX\_LENGTH

Maximum length of log hexdump message.

## Typedefs

typedef unsigned long log\_arg\_t

Log argument type.

Should preferably be equivalent to a native word size.

## Functions

void log\_msg\_pool\_init(void)

Function for initialization of the log message pool.

void log\_msg\_get(struct [log\\_msg](#) \*msg)

Function for indicating that message is in use.

Message can be used (read) by multiple users. Internal reference counter is atomically increased. See [log\\_msg\\_put](#).

### Parameters

- msg – Message.

void log\_msg\_put(struct [log\\_msg](#) \*msg)

Function for indicating that message is no longer in use.

Internal reference counter is atomically decreased. If reference counter equals 0 message is freed.

### Parameters

- msg – Message.

static inline uint32\_t log\_msg\_domain\_id\_get(struct *log\_msg* \*msg)

Get domain ID of the message.

**Parameters**

- msg – Message

**Returns** Domain ID.

static inline uint32\_t log\_msg\_source\_id\_get(struct *log\_msg* \*msg)

Get source ID (module or instance) of the message.

**Parameters**

- msg – Message

**Returns** Source ID.

static inline uint32\_t log\_msg\_level\_get(struct *log\_msg* \*msg)

Get severity level of the message.

**Parameters**

- msg – Message

**Returns** Severity message.

static inline uint32\_t log\_msg\_timestamp\_get(struct *log\_msg* \*msg)

Get timestamp of the message.

**Parameters**

- msg – Message

**Returns** Timestamp value.

static inline bool log\_msg\_is\_std(struct *log\_msg* \*msg)

Check if message is of standard type.

**Parameters**

- msg – Message

**Return values**

- true – Standard message.
- false – Hexdump message.

uint32\_t log\_msg\_nargs\_get(struct *log\_msg* \*msg)

Returns number of arguments in standard log message.

**Parameters**

- msg – Standard log message.

**Returns** Number of arguments.

*log\_arg\_t* log\_msg\_arg\_get(struct *log\_msg* \*msg, uint32\_t arg\_idx)

Gets argument from standard log message.

**Parameters**

- msg – Standard log message.
- arg\_idx – Argument index.

**Returns** Argument value or 0 if arg\_idx exceeds number of arguments in the message.

```
const char *log_msg_str_get(struct log_msg *msg)
```

Gets pointer to the unformatted string from standard log message.

**Parameters**

- `msg` – Standard log message.

**Returns** Pointer to the string.

```
struct log_msg *log_msg_hexdump_create(const char *str, const uint8_t *data, uint32_t length)
```

Allocates chunks for hexdump message and copies the data.

Function resets header and sets following fields:

- message type
- length

---

**Note:** Allocation and partial filling is combined for performance reasons.

---

**Parameters**

- `str` – String.
- `data` – Data.
- `length` – Data length.

**Returns** Pointer to allocated head of the message or NULL

```
void log_msg_hexdump_data_put(struct log_msg *msg, uint8_t *data, size_t *length, size_t  
                             offset)
```

Put data into hexdump log message.

**Parameters**

- `msg` – **[in]** Message.
- `data` – **[in]** Data to be copied.
- `length` – **[inout]** Input: requested amount. Output: actual amount.
- `offset` – **[in]** Offset.

```
void log_msg_hexdump_data_get(struct log_msg *msg, uint8_t *data, size_t *length, size_t  
                             offset)
```

Get data from hexdump log message.

**Parameters**

- `msg` – **[in]** Message.
- `data` – **[in]** Buffer for data.
- `length` – **[inout]** Input: requested amount. Output: actual amount.
- `offset` – **[in]** Offset.

```
union log_msg_chunk *log_msg_no_space_handle(void)
```

```
union log_msg_chunk *log_msg_chunk_alloc(void)
```

Allocate single chunk from the pool.

**Returns** Pointer to the allocated chunk or NULL if failed to allocate.

```
static inline struct log_msg *log_msg_create_0(const char *str)
```

Create standard log message with no arguments.

Function resets header and sets following fields:

- message type
- string pointer

**Returns** Pointer to allocated head of the message or NULL.

```
static inline struct log_msg *log_msg_create_1(const char *str, log_arg_t arg1)
```

Create standard log message with one argument.

Function resets header and sets following fields:

- message type
- string pointer
- number of arguments
- argument

**Parameters**

- *str* – String.
- *arg1* – Argument.

**Returns** Pointer to allocated head of the message or NULL.

```
static inline struct log_msg *log_msg_create_2(const char *str, log_arg_t arg1, log_arg_t arg2)
```

Create standard log message with two arguments.

Function resets header and sets following fields:

- message type
- string pointer
- number of arguments
- arguments

**Parameters**

- *str* – String.
- *arg1* – Argument 1.
- *arg2* – Argument 2.

**Returns** Pointer to allocated head of the message or NULL.

```
static inline struct log_msg *log_msg_create_3(const char *str, log_arg_t arg1, log_arg_t arg2,  
                                              log_arg_t arg3)
```

Create standard log message with three arguments.

Function resets header and sets following fields:

- message type
- string pointer
- number of arguments
- arguments

**Parameters**

- `str` – String.
- `arg1` – Argument 1.
- `arg2` – Argument 2.
- `arg3` – Argument 3.

**Returns** Pointer to allocated head of the message or NULL.

struct `log_msg` \*`log_msg_create_n`(const char \*`str`, `log_arg_t` \*`args`, uint32\_t `nargs`)

Create standard log message with variable number of arguments.

Function resets header and sets following fields:

- message type
- string pointer
- number of arguments
- arguments

#### Parameters

- `str` – String.
- `args` – Array with arguments.
- `nargs` – Number of arguments.

**Returns** Pointer to allocated head of the message or NULL.

uint32\_t `log_msg_mem_get_free`(void)

Get number of free blocks from the log mem pool.

uint32\_t `log_msg_mem_get_used`(void)

Get number of used blocks from the log mem pool.

uint32\_t `log_msg_mem_get_max_used`(void)

Get max used blocks from the log mem pool.

struct `log_msg_ids`

*#include <log\_msg.h>* Part of log message header identifying source and level.

#### Public Members

uint16\_t `level`

Severity.

uint16\_t `domain_id`

Originating domain.

uint16\_t `source_id`

Source ID.

struct `log_msg_generic_hdr`

*#include <log\_msg.h>* Part of log message header common to standard and hexdump log message.

struct log\_msg\_std\_hdr

*#include <log\_msg.h>* Part of log message header specific to standard log message.

struct log\_msg\_hexdump\_hdr

*#include <log\_msg.h>* Part of log message header specific to hexdump log message.

struct log\_msg\_hdr

*#include <log\_msg.h>* Log message header structure

### Public Members

atomic\_t ref\_cnt

Reference counter for tracking message users.

struct *log\_msg\_ids* ids

Identification part of the message.

uint32\_t timestamp

Timestamp.

union log\_msg\_hdr\_params

*#include <log\_msg.h>*

### Public Members

struct *log\_msg\_generic\_hdr* generic

struct *log\_msg\_std\_hdr* std

struct *log\_msg\_hexdump\_hdr* hexdump

uint16\_t raw

union log\_msg\_head\_data

*#include <log\_msg.h>* Data part of log message.

### Public Members

*log\_arg\_t* args[3U]

uint8\_t bytes[(3U \* sizeof(*log\_arg\_t*))]

struct log\_msg\_ext\_head\_data

*#include <log\_msg.h>* Data part of extended log message.

```
union log_msg_ext_head_data_data
    #include <log_msg.h>
```

### Public Members

```
log_arg_t args[(3U - (sizeof(void*) / sizeof(log_arg_t)))]
```

```
uint8_t bytes[((3U * sizeof(log_arg_t)) - sizeof(void*))]
```

```
struct log_msg
    #include <log_msg.h> Log message structure.
```

### Public Members

```
struct log_msg *next
    Used by logger core list.
```

```
struct log_msg_hdr hdr
    Message header.
```

```
union log_msg.log_msg_data payload
    Message data.
```

```
union log_msg_data

## Logger backend interface

*group* `log_backend`

Logger backend interface.

### Defines

LOG\_BACKEND\_DEFINE(`_name`, `_api`, `_autostart`, ...)

Macro for creating a logger backend instance.

#### Parameters

- `_name` – Name of the backend instance.
- `_api` – Logger backend API.
- `_autostart` – If true backend is initialized and activated together with the logger subsystem.
- ... – Optional context.

### Functions

static inline void `log_backend_put`(const struct `log_backend` \*const backend, struct `log_msg` \*msg)

Put message with log entry to the backend.

#### Parameters

- `backend` – [in] Pointer to the backend instance.
- `msg` – [in] Pointer to message with log entry.

static inline void `log_backend_msg2_process`(const struct `log_backend` \*const backend, union `log_msg2_generic` \*msg)

```
static inline void log_backend_put_sync_string(const struct log_backend *const backend, struct
                                             log_msg_ids src_level, uint32_t timestamp,
                                             const char *fmt, va_list ap)
```

Synchronously process log message.

#### Parameters

- `backend` – **[in]** Pointer to the backend instance.
- `src_level` – **[in]** Message details.
- `timestamp` – **[in]** Timestamp.
- `fmt` – **[in]** Log string.
- `ap` – **[in]** Log string arguments.

```
static inline void log_backend_put_sync_hexdump(const struct log_backend *const backend,
                                              struct log_msg_ids src_level, uint32_t
                                              timestamp, const char *metadata, const
                                              uint8_t *data, uint32_t len)
```

Synchronously process log hexdump\_message.

#### Parameters

- `backend` – **[in]** Pointer to the backend instance.
- `src_level` – **[in]** Message details.
- `timestamp` – **[in]** Timestamp.
- `metadata` – **[in]** Raw string associated with the data.
- `data` – **[in]** Data.
- `len` – **[in]** Data length.

```
static inline void log_backend_dropped(const struct log_backend *const backend, uint32_t cnt)
```

Notify backend about dropped log messages.

Function is optional.

#### Parameters

- `backend` – **[in]** Pointer to the backend instance.
- `cnt` – **[in]** Number of dropped logs since last notification.

```
static inline void log_backend_panic(const struct log_backend *const backend)
```

Reconfigure backend to panic mode.

#### Parameters

- `backend` – **[in]** Pointer to the backend instance.

```
static inline void log_backend_id_set(const struct log_backend *const backend, uint8_t id)
```

Set backend id.

---

**Note:** It is used internally by the logger.

---

#### Parameters

- `backend` – Pointer to the backend instance.
- `id` – ID.

static inline uint8\_t log\_backend\_id\_get(const struct *log\_backend* \*const backend)  
Get backend id.

---

**Note:** It is used internally by the logger.

---

**Parameters**

- backend – [in] Pointer to the backend instance.

**Returns** Id.

static inline const struct *log\_backend* \*log\_backend\_get(uint32\_t idx)  
Get backend.

**Parameters**

- idx – [in] Pointer to the backend instance.

**Returns** Pointer to the backend instance.

static inline int log\_backend\_count\_get(void)  
Get number of backends.

**Returns** Number of backends.

static inline void log\_backend\_activate(const struct *log\_backend* \*const backend, void \*ctx)  
Activate backend.

**Parameters**

- backend – [in] Pointer to the backend instance.
- ctx – [in] User context.

static inline void log\_backend\_deactivate(const struct *log\_backend* \*const backend)  
Deactivate backend.

**Parameters**

- backend – [in] Pointer to the backend instance.

static inline bool log\_backend\_is\_active(const struct *log\_backend* \*const backend)  
Check state of the backend.

**Parameters**

- backend – [in] Pointer to the backend instance.

**Returns** True if backend is active, false otherwise.

struct log\_backend\_api  
#include <log\_backend.h> Logger backend API.

struct log\_backend\_control\_block  
#include <log\_backend.h> Logger backend control block.

struct log\_backend  
#include <log\_backend.h> Logger backend structure.

## Logger output formatting

*group* `log_output`  
Log output API.

### Defines

`LOG_OUTPUT_FLAG_COLORS`

Flag forcing ANSI escape code colors, red (errors), yellow (warnings).

`LOG_OUTPUT_FLAG_TIMESTAMP`

Flag forcing timestamp.

`LOG_OUTPUT_FLAG_FORMAT_TIMESTAMP`

Flag forcing timestamp formatting.

`LOG_OUTPUT_FLAG_LEVEL`

Flag forcing severity level prefix.

`LOG_OUTPUT_FLAG_CRLF_NONE`

Flag preventing the logger from adding CR and LF characters.

`LOG_OUTPUT_FLAG_CRLF_LFONLY`

Flag forcing a single LF character for line breaks.

`LOG_OUTPUT_FLAG_FORMAT_SYSLOG`

Flag forcing syslog format specified in RFC 5424.

`LOG_OUTPUT_FLAG_FORMAT_SYST`

Flag forcing syslog format specified in mipi sys-t.

`LOG_OUTPUT_DEFINE(_name, _func, _buf, _size)`

Create [\*log\\_output\*](#) instance.

#### Parameters

- `_name` – Instance name.
- `_func` – Function for processing output data.
- `_buf` – Pointer to the output buffer.
- `_size` – Size of the output buffer.

### Typedefs

`typedef int (*log_output_func_t)(uint8_t *buf, size_t size, void *ctx)`

Prototype of the function processing output data.

---

**Note:** If the log output function cannot process all of the data, it is its responsibility to mark them as dropped or discarded by returning the corresponding number of bytes dropped or discarded to the caller.

---

**Param buf** The buffer data.

**Param size** The buffer size.

**Param ctx** User context.

**Return** Number of bytes processed, dropped or discarded.

## Functions

```
void log_output_msg_process(const struct log\_output *output, struct log\_msg *msg, uint32_t
                           flags)
```

Process log messages to readable strings.

Function is using provided context with the buffer and output function to process formatted string and output the data.

### Parameters

- output – Pointer to the log output instance.
- msg – Log message.
- flags – Optional flags.

```
void log_output_msg2_process(const struct log\_output *log_output, struct log_msg2 *msg,
                             uint32_t flags)
```

Process log messages v2 to readable strings.

Function is using provided context with the buffer and output function to process formatted string and output the data.

### Parameters

- log\_output – Pointer to the log output instance.
- msg – Log message.
- flags – Optional flags.

```
void log_output_string(const struct log\_output *output, struct log\_msg\_ids src_level, uint32_t
                       timestamp, const char *fmt, va_list ap, uint32_t flags)
```

Process log string.

Function is formatting provided string adding optional prefixes and postfixes.

### Parameters

- output – Pointer to [log\\_output](#) instance.
- src\_level – Log source and level structure.
- timestamp – Timestamp.
- fmt – String.
- ap – String arguments.
- flags – Optional flags.

```
void log_output_hexdump(const struct log\_output *output, struct log\_msg\_ids src_level, uint32_t
                        timestamp, const char *metadata, const uint8_t *data, uint32_t
                        length, uint32_t flags)
```

Process log hexdump.

Function is formatting provided hexdump adding optional prefixes and postfixes.

### Parameters

- output – Pointer to `log_output` instance.
- src\_level – Log source and level structure.
- timestamp – Timestamp.
- metadata – String.
- data – Data.
- length – Data length.
- flags – Optional flags.

void log\_output\_dropped\_process(const struct `log_output` \*output, uint32\_t cnt)

Process dropped messages indication.

Function prints error message indicating lost log messages.

#### Parameters

- output – Pointer to the log output instance.
- cnt – Number of dropped messages.

void log\_output\_flush(const struct `log_output` \*output)

Flush output buffer.

#### Parameters

- output – Pointer to the log output instance.

static inline void log\_output\_ctx\_set(const struct `log_output` \*output, void \*ctx)

Function for setting user context passed to the output function.

#### Parameters

- output – Pointer to the log output instance.
- ctx – User context.

static inline void log\_output\_hostname\_set(const struct `log_output` \*output, const char \*hostname)

Function for setting hostname of this device.

#### Parameters

- output – Pointer to the log output instance.
- hostname – Hostname of this device

void log\_output\_timestamp\_freq\_set(uint32\_t freq)

Set timestamp frequency.

#### Parameters

- freq – Frequency in Hz.

uint64\_t log\_output\_timestamp\_to\_us(uint32\_t timestamp)

Convert timestamp of the message to us.

#### Parameters

- timestamp – Message timestamp

**Returns** Timestamp value in us.

struct log\_output\_control\_block

`#include <log_output.h>`

```
struct log_output
    #include <log_output.h> Log_output instance structure.
```

## 7.16 Memory Management

The following contains various topics regarding memory management.

### 7.16.1 Demand Paging

Demand paging provides a mechanism where data is only brought into physical memory as required by current execution context. The physical memory is conceptually divided in page-sized page frames as regions to hold data.

- When the processor tries to access data and the data page exists in one of the page frames, the execution continues without any interruptions.
- When the processor tries to access the data page that does not exist in any page frames, a page fault occurs. The paging code then brings in the corresponding data page from backing store into physical memory if there is a free page frame. If there is no more free page frames, the eviction algorithm is invoked to select a data page to be paged out, thus freeing up a page frame for new data to be paged in. If this data page has been modified after it is first paged in, the data will be written back into the backing store. If no modifications is done or after written back into backing store, the data page is now considered paged out and the corresponding page frame is now free. The paging code then invokes the backing store to page in the data page corresponding to the location of the requested data. The backing store copies that data page into the free page frame. Now the data page is in physical memory and execution can continue.

There are functions where paging in and out can be invoked manually using `k_mem_page_in()` and `k_mem_page_out()`. `k_mem_page_in()` can be used to page in data pages in anticipation that they are required in the near future. This is used to minimize number of page faults as these data pages are already in physical memory, and thus minimizing latency. `k_mem_page_out()` can be used to page out data pages where they are not going to be accessed for a considerable amount of time. This frees up page frames so that the next page in can be executed faster as the paging code does not need to invoke the eviction algorithm.

#### Terminology

**Data Page** A data page is a page-sized region of data. It may exist in a page frame, or be paged out to some backing store. Its location can always be looked up in the CPU's page tables (or equivalent) by virtual address. The data type will always be `void *` or in some cases `uint8_t *` when doing pointer arithmetic.

**Page Frame** A page frame is a page-sized physical memory region in RAM. It is a container where a data page may be placed. It is always referred to by physical address. Zephyr has a convention of using `uintptr_t` for physical addresses. For every page frame, a `struct z_page_frame` is instantiated to store metadata. Flags for each page frame:

- `Z_PAGE_FRAME_PINNED` indicates a page frame is pinned in memory and should never be paged out.
- `Z_PAGE_FRAME_RESERVED` indicates a physical page reserved by hardware and should not be used at all.
- `Z_PAGE_FRAME_MAPPED` is set when a physical page is mapped to virtual memory address.
- `Z_PAGE_FRAME_BUSY` indicates a page frame is currently involved in a page-in/out operation.
- `Z_PAGE_FRAME_BACKED` indicates a page frame has a clean copy in the backing store.

**Z\_SCRATCH\_PAGE** The virtual address of a special page provided to the backing store to: \* Copy a data page from Z\_SCRATCH\_PAGE to the specified location; or, \* Copy a data page from the provided location to Z\_SCRATCH\_PAGE. This is used as an intermediate page for page in/out operations. This scratch needs to be mapped read/write for backing store code to access. However the data page itself may only be mapped as read-only in virtual address space. If this page is provided as-is to backing store, the data page must be re-mapped as read/write which has security implications as the data page is no longer read-only to other parts of the application.

## Paging Statistics

Paging statistics can be obtained via various function calls when **:kconfig: `CONFIG\_DEMAND\_PAGING\_TIMING\_HISTOGRAM\_NUM\_BINS`** is enabled:

- Overall statistics via `k_mem_paging_stats_get()`
- Per-thread statistics via `k_mem_paging_thread_stats_get()` if **:kconfig: `CONFIG\_DEMAND\_PAGING\_THREAD\_STATS`** is enabled
- Execution time histogram can be obtained when **:kconfig: `CONFIG\_DEMAND\_PAGING\_TIMING\_HISTOGRAM`** is enabled, and **:kconfig: `CONFIG\_DEMAND\_PAGING\_TIMING\_HISTOGRAM\_NUM\_BINS`** is defined. Note that the timing is highly dependent on the architecture, SoC or board. It is highly recommended that `k_mem_paging_eviction_histogram_bounds[]` and `k_mem_paging_backing_store_histogram_bounds[]` be defined for a particular application.
  - Execution time histogram of eviction algorithm via `k_mem_paging_histogram_eviction_get()`
  - Execution time histogram of backing store doing page-in via `k_mem_paging_histogram_backing_store_page_in_get()`
  - Execution time histogram of backing store doing page-out via `k_mem_paging_histogram_backing_store_page_out_get()`

## Eviction Algorithm

The eviction algorithm is used to determine which data page and its corresponding page frame can be paged out to free up a page frame for the next page in operation. There are two functions which are called from the kernel paging code:

- `k_mem_paging_eviction_init()` is called to initialize the eviction algorithm. This is called at POST\_KERNEL.
- `k_mem_paging_eviction_select()` is called to select a data page to evict. A function argument `dirty` is written to signal the caller whether the selected data page has been modified since it is first paged in. If the `dirty` bit is returned as set, the paging code signals to the backing store to write the data page back into storage (thus updating its content). The function returns a pointer to the page frame corresponding to the selected data page.

Currently, a NRU (Not-Recently-Used) eviction algorithm has been implemented as a sample. This is a very simple algorithm which ranks each data page on whether they have been accessed and modified. The selection is based on this ranking.

To implement a new eviction algorithm, the two functions mentioned above must be implemented.

## Backing Store

Backing store is responsible for paging in/out data page between their corresponding page frames and storage. These are the functions which must be implemented:

- `k_mem_paging_backing_store_init()` is called to initialize the backing store at POST\_KERNEL.

- `k_mem_paging_backing_store_location_get()` is called to reserve a backing store location so a data page can be paged out. This location token is passed to `k_mem_paging_backing_store_page_out()` to perform actual page out operation.
- `k_mem_paging_backing_store_location_free()` is called to free a backing store location (the location token) which can then be used for subsequent page out operation.
- `k_mem_paging_backing_store_page_in()` copies a data page from the backing store location associated with the provided location token to the page pointed by `Z_SCRATCH_PAGE`.
- `k_mem_paging_backing_store_page_out()` copies a data page from `Z_SCRATCH_PAGE` to the backing store location associated with the provided location token.
- `k_mem_paging_backing_store_page_finalize()` is invoked after `k_mem_paging_backing_store_page_in()` so that the page frame struct may be updated for internal accounting. This can be a no-op.

To implement a new backing store, the functions mentioned above must be implemented. `k_mem_paging_backing_store_page_finalize()` can be an empty function if so desired.

## API Reference

group mem-demand-paging

### Functions

int `k_mem_page_out`(void \*addr, size\_t size)

Evict a page-aligned virtual memory region to the backing store

Useful if it is known that a memory region will not be used for some time. All the data pages within the specified region will be evicted to the backing store if they weren't already, with their associated page frames marked as available for mappings or page-ins.

None of the associated page frames mapped to the provided region should be pinned.

Note that there are no guarantees how long these pages will be evicted, they could take page faults immediately.

If `CONFIG_DEMAND_PAGING_ALLOW_IRQ` is enabled, this function may not be called by ISRs as the backing store may be in-use.

#### Parameters

- `addr` – Base page-aligned virtual address
- `size` – Page-aligned data region size

#### Return values

- 0 – Success
- `-ENOMEM` – Insufficient space in backing store to satisfy request. The region may be partially paged out.

void `k_mem_page_in`(void \*addr, size\_t size)

Load a virtual data region into memory

After the function completes, all the page frames associated with this function will be paged in. However, they are not guaranteed to stay there. This is useful if the region is known to be used soon.

If `CONFIG_DEMAND_PAGING_ALLOW_IRQ` is enabled, this function may not be called by ISRs as the backing store may be in-use.

**Parameters**

- `addr` – Base page-aligned virtual address
- `size` – Page-aligned data region size

```
void k_mem_pin(void *addr, size_t size)
```

Pin an aligned virtual data region, paging in as necessary

After the function completes, all the page frames associated with this region will be resident in memory and pinned such that they stay that way. This is a stronger version of `z_mem_page_in()`.

If `CONFIG_DEMAND_PAGING_ALLOW_IRQ` is enabled, this function may not be called by ISRs as the backing store may be in-use.

**Parameters**

- `addr` – Base page-aligned virtual address
- `size` – Page-aligned data region size

```
void k_mem_unpin(void *addr, size_t size)
```

Un-pin an aligned virtual data region

After the function completes, all the page frames associated with this region will be no longer marked as pinned. This does not evict the region, follow this with `z_mem_page_out()` if you need that.

**Parameters**

- `addr` – Base page-aligned virtual address
- `size` – Page-aligned data region size

```
void k_mem_paging_stats_get(struct k_mem_paging_stats_t *stats)
```

Get the paging statistics since system startup

This populates the paging statistics struct being passed in as argument.

**Parameters**

- `stats` – **[inout]** Paging statistics struct to be filled.

```
void k_mem_paging_thread_stats_get(struct k_thread *thread, struct k_mem_paging_stats_t  
                                  *stats)
```

Get the paging statistics since system startup for a thread

This populates the paging statistics struct being passed in as argument for a particular thread.

**Parameters**

- `thread` – **[in]** Thread
- `stats` – **[inout]** Paging statistics struct to be filled.

```
void k_mem_paging_histogram_eviction_get(struct k_mem_paging_histogram_t *hist)
```

Get the eviction timing histogram

This populates the timing histogram struct being passed in as argument.

**Parameters**

- `hist` – **[inout]** Timing histogram struct to be filled.

```
void k_mem_paging_histogram_backing_store_page_in_get(struct  
                                                       k_mem_paging_histogram_t  
                                                       *hist)
```

Get the backing store page-in timing histogram

This populates the timing histogram struct being passed in as argument.

**Parameters**

- `hist` – **[inout]** Timing histogram struct to be filled.

```
void k_mem_paging_histogram_backing_store_page_out_get(struct
                                                    k_mem_paging_histogram_t
                                                    *hist)
```

Get the backing store page-out timing histogram

This populates the timing histogram struct being passed in as argument.

**Parameters**

- `hist` – **[inout]** Timing histogram struct to be filled.

**Eviction Algorithm APIs**

*group* mem-demand-paging-eviction

Eviction algorithm APIs

**Functions**

```
struct z_page_frame *k_mem_paging_eviction_select(bool *dirty)
```

Select a page frame for eviction

The kernel will invoke this to choose a page frame to evict if there are no free page frames.

This function will never be called before the initial [k\\_mem\\_paging\\_eviction\\_init\(\)](#).

This function is invoked with interrupts locked.

**Parameters**

- `dirty` – **[out]** Whether the page to evict is dirty

**Returns** The page frame to evict

```
void k_mem_paging_eviction_init(void)
```

Initialization function

Called at POST\_KERNEL to perform any necessary initialization tasks for the eviction algorithm. [k\\_mem\\_paging\\_eviction\\_select\(\)](#) is guaranteed to never be called until this has returned, and this will only be called once.

**Backing Store APIs**

*group* mem-demand-paging-backing-store

Backing store APIs

**Functions**

```
int k_mem_paging_backing_store_location_get(struct z_page_frame *pf, uintptr_t *location,
                                           bool page_fault)
```

Reserve or fetch a storage location for a data page loaded into a page frame

The returned location token must be unique to the mapped virtual address. This location will be used in the backing store to page out data page contents for later retrieval. The location value must be page-aligned.

This function may be called multiple times on the same data page. If its page frame has its `Z_PAGE_FRAME_BACKED` bit set, it is expected to return the previous backing store location

for the data page containing a cached clean copy. This clean copy may be updated on page-out, or used to discard clean pages without needing to write out their contents.

If the backing store is full, some other backing store location which caches a loaded data page may be selected, in which case its associated page frame will have the `Z_PAGE_FRAME_BACKED` bit cleared (as it is no longer cached).

`pf->addr` will indicate the virtual address the page is currently mapped to. Large, sparse backing stores which can contain the entire address space may simply generate location tokens purely as a function of `pf->addr` with no other management necessary.

This function distinguishes whether it was called on behalf of a page fault. A free backing store location must always be reserved in order for page faults to succeed. If the `page_fault` parameter is not set, this function should return `-ENOMEM` even if one location is available.

This function is invoked with interrupts locked.

#### Parameters

- `pf` – Virtual address to obtain a storage location
- `location` – **[out]** storage location token
- `page_fault` – Whether this request was for a page fault

**Returns** 0 Success

**Returns** `-ENOMEM` Backing store is full

```
void k_mem_paging_backing_store_location_free(uintptr_t location)
```

Free a backing store location

Any stored data may be discarded, and the location token associated with this address may be re-used for some other data page.

This function is invoked with interrupts locked.

#### Parameters

- `location` – Location token to free

```
void k_mem_paging_backing_store_page_out(uintptr_t location)
```

Copy a data page from `Z_SCRATCH_PAGE` to the specified location

Immediately before this is called, `Z_SCRATCH_PAGE` will be mapped read-write to the intended source page frame for the calling context.

Calls to this and [`k\_mem\_paging\_backing\_store\_page\_in\(\)`](#) will always be serialized, but interrupts may be enabled.

#### Parameters

- `location` – Location token for the data page, for later retrieval

```
void k_mem_paging_backing_store_page_in(uintptr_t location)
```

Copy a data page from the provided location to `Z_SCRATCH_PAGE`.

Immediately before this is called, `Z_SCRATCH_PAGE` will be mapped read-write to the intended destination page frame for the calling context.

Calls to this and [`k\_mem\_paging\_backing\_store\_page\_out\(\)`](#) will always be serialized, but interrupts may be enabled.

#### Parameters

- `location` – Location token for the data page

```
void k_mem_paging_backing_store_page_finalize(struct z_page_frame *pf, uintptr_t location)
```

Update internal accounting after a page-in

This is invoked after `k_mem_paging_backing_store_page_in()` and interrupts have been\* re-locked, making it safe to access the `z_page_frame` data. The location value will be the same passed to `k_mem_paging_backing_store_page_in()`.

The primary use-case for this is to update custom fields for the backing store in the page frame, to reflect where the data should be evicted to if it is paged out again. This may be a no-op in some implementations.

If the backing store caches paged-in data pages, this is the appropriate time to set the `Z_PAGE_FRAME_BACKED` bit. The kernel only skips paging out clean data pages if they are noted as clean in the page tables and the `Z_PAGE_FRAME_BACKED` bit is set in their associated page frame.

#### Parameters

- `pf` – Page frame that was loaded in
- `location` – Location of where the loaded data page was retrieved

```
void k_mem_paging_backing_store_init(void)
```

Backing store initialization function.

The implementation may expect to receive page in/out calls as soon as this returns, but not before that. Called at `POST_KERNEL`.

This function is expected to do two things:

- Initialize any internal data structures and accounting for the backing store.
- If the backing store already contains all or some loaded kernel data pages at boot time, `Z_PAGE_FRAME_BACKED` should be appropriately set for their associated page frames, and any internal accounting set up appropriately.

## 7.17 Miscellaneous APIs

### 7.17.1 Checksum APIs

#### CRC

*group crc*

#### Functions

```
uint16_t crc16(const uint8_t *src, size_t len, uint16_t polynomial, uint16_t initial_value, bool pad)
```

Generic function for computing CRC 16.

Compute CRC 16 by passing in the address of the input, the input length and polynomial used in addition to the initial value.

#### Parameters

- `src` – Input bytes for the computation
- `len` – Length of the input in bytes
- `polynomial` – The polynomial to use omitting the leading  $x^{16}$  coefficient
- `initial_value` – Initial value for the CRC computation

- `pad` – Adds padding with zeros at the end of input bytes

**Returns** The computed CRC16 value

```
uint8_t crc8(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool
             reversed)
```

Generic function for computing CRC 8.

Compute CRC 8 by passing in the address of the input, the input length and polynomial used in addition to the initial value.

**Parameters**

- `src` – Input bytes for the computation
- `len` – Length of the input in bytes
- `polynomial` – The polynomial to use omitting the leading  $x^8$  coefficient
- `initial_value` – Initial value for the CRC computation
- `reversed` – Should we use reflected/reversed values or not

**Returns** The computed CRC8 value

```
uint16_t crc16_ccitt(uint16_t seed, const uint8_t *src, size_t len)
```

Compute the CRC-16/CCITT checksum of a buffer.

See ITU-T Recommendation V.41 (November 1988). Uses 0x1021 as the polynomial, reflects the input, and reflects the output.

To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

For CRC-16/CCITT, use 0 as the initial seed. Other checksums in the same family can be calculated by changing the seed and/or XORing the final value. Examples include:

- X-25 (used in PPP): seed=0xffff, xor=0xffff, residual=0xf0b8

---

**Note:** API changed in Zephyr 1.11.

---

**Parameters**

- `seed` – Value to seed the CRC with
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes

**Returns** The computed CRC16 value

```
uint16_t crc16_itu_t(uint16_t seed, const uint8_t *src, size_t len)
```

Compute the CRC-16/XMODEM checksum of a buffer.

The MSB first version of ITU-T Recommendation V.41 (November 1988). Uses 0x1021 as the polynomial with no reflection.

To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

For CRC-16/XMODEM, use 0 as the initial seed. Other checksums in the same family can be calculated by changing the seed and/or XORing the final value. Examples include:

- CCIITT-FALSE: seed=0xffff

- GSM: seed=0, xorout=0xffff, residue=0x1d0f

**Parameters**

- seed – Value to seed the CRC with
- src – Input bytes for the computation
- len – Length of the input in bytes

**Returns** The computed CRC16 value

static inline uint16\_t crc16\_ansi(const uint8\_t \*src, size\_t len)

Compute ANSI variant of CRC 16.

ANSI variant of CRC 16 is using 0x8005 as its polynomial with the initial value set to 0xffff.

**Parameters**

- src – Input bytes for the computation
- len – Length of the input in bytes

**Returns** The computed CRC16 value

uint32\_t crc32\_ieee(const uint8\_t \*data, size\_t len)

Generate IEEE conform CRC32 checksum.

**Parameters**

- \*data – Pointer to data on which the CRC should be calculated.
- len – Data length.

**Returns** CRC32 value.

uint32\_t crc32\_ieee\_update(uint32\_t crc, const uint8\_t \*data, size\_t len)

Update an IEEE conforming CRC32 checksum.

**Parameters**

- crc – CRC32 checksum that needs to be updated.
- \*data – Pointer to data on which the CRC should be calculated.
- len – Data length.

**Returns** CRC32 value.

uint32\_t crc32\_c(uint32\_t crc, const uint8\_t \*data, size\_t len, bool first\_pkt, bool last\_pkt)

Calculate CRC32C (Castagnoli) checksum.

**Parameters**

- crc – CRC32C checksum that needs to be updated.
- \*data – Pointer to data on which the CRC should be calculated.
- len – Data length.
- first\_pkt – Whether this is the first packet in the stream.
- last\_pkt – Whether this is the last packet in the stream.

**Returns** CRC32 value.

uint8\_t crc8\_ccitt(uint8\_t initial\_value, const void \*buf, size\_t len)

Compute CCITT variant of CRC 8.

Normal CCITT variant of CRC 8 is using 0x07.

**Parameters**

- `initial_value` – Initial value for the CRC computation
- `buf` – Input bytes for the computation
- `len` – Length of the input in bytes

**Returns** The computed CRC8 value

`uint8_t crc7_be(uint8_t seed, const uint8_t *src, size_t len)`

Compute the CRC-7 checksum of a buffer.

See JESD84-A441. Used by the MMC protocol. Uses 0x09 as the polynomial with no reflection. The CRC is left justified, so bit 7 of the result is bit 6 of the CRC.

**Parameters**

- `seed` – Value to seed the CRC with
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes

**Returns** The computed CRC7 value

## 7.17.2 Structured Data APIs

### JSON

*group json*

#### Defines

`JSON_OBJ_DESCR_PRIM(struct_, field_name_, type_)`

Helper macro to declare a descriptor for supported primitive values.

Here's an example of use:

```
struct foo {
    int some_int;
};

struct json_obj_descr foo[] = {
    JSON_OBJ_DESCR_PRIM(struct foo, some_int, JSON_TOK_NUMBER),
};
```

#### Parameters

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct
- `type_` – Token type for JSON value corresponding to a primitive type. Must be one of: `JSON_TOK_STRING` for strings, `JSON_TOK_NUMBER` for numbers, `JSON_TOK_TRUE` (or `JSON_TOK_FALSE`) for booleans.

`JSON_OBJ_DESCR_OBJECT(struct_, field_name_, sub_descr_)`

Helper macro to declare a descriptor for an object value.

Here's an example of use:

```

struct nested {
    int foo;
    struct {
        int baz;
    } bar;
};

struct json_obj_descr nested_bar[] = {
    { ... declare bar.baz descriptor ... },
};
struct json_obj_descr nested[] = {
    { ... declare foo descriptor ... },
    JSON_OBJ_DESCR_OBJECT(struct nested, bar, nested_bar),
};

```

#### Parameters

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct
- `sub_descr_` – Array of *json\_obj\_descr* describing the subobject

`JSON_OBJ_DESCR_ARRAY(struct_, field_name_, max_len_, len_field_, elem_type_)`  
 Helper macro to declare a descriptor for an array of primitives.

Here's an example of use:

```

struct example {
    int foo[10];
    size_t foo_len;
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_ARRAY(struct example, foo, 10, foo_len,
                        JSON_TOK_NUMBER)
};

```

#### Parameters

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct
- `max_len_` – Maximum number of elements in array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_type_` – Element type, must be a primitive type

`JSON_OBJ_DESCR_OBJ_ARRAY(struct_, field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)`

Helper macro to declare a descriptor for an array of objects.

Here's an example of use:

```
struct person_height {
    const char *name;
    int height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY(struct people_heights, heights, 10,
                             heights_len, person_height_descr,
                             ARRAY_SIZE(person_height_descr)),
};
```

### Parameters

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct containing the array
- `max_len_` – Maximum number of elements in the array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_descr_` – Element descriptor, pointer to a descriptor array
- `elem_descr_len_` – Number of elements in `elem_descr_`

`JSON_OBJ_DESCR_ARRAY_ARRAY(struct_, field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)`

Helper macro to declare a descriptor for an array of array.

Here's an example of use:

```
struct person_height {
    const char *name;
    int height;
};

struct person_heights_array {
    struct person_height heights;
}

struct people_heights {
    struct person_height_array heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
```

(continues on next page)

(continued from previous page)

```
};

struct json_obj_descr person_height_array_descr[] = {
    JSON_OBJ_DESCR_OBJECT(struct person_heights_array,
                          heights, person_height_descr),
};

struct json_obj_descr array_array[] = {
    JSON_OBJ_DESCR_ARRAY_ARRAY(struct people_heights, heights, 10,
                              heights_len, person_height_array_descr,
                              ARRAY_SIZE(person_height_array_descr)),
};
```

**Parameters**

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct containing the array
- `max_len_` – Maximum number of elements in the array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_descr_` – Element descriptor, pointer to a descriptor array
- `elem_descr_len_` – Number of elements in `elem_descr_`

`JSON_OBJ_DESCR_PRIM_NAMED(struct_, json_field_name_, struct_field_name_, type_)`

Variant of `JSON_OBJ_DESCR_PRIM` that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

**See also:**

[\*JSON\\_OBJ\\_DESCR\\_PRIM\*](#)

**Parameters**

- `struct_` – Struct packing the values.
- `json_field_name_` – String, field name in JSON strings
- `struct_field_name_` – Field name in the struct
- `type_` – Token type for JSON value corresponding to a primitive type.

`JSON_OBJ_DESCR_OBJECT_NAMED(struct_, json_field_name_, struct_field_name_, sub_descr_)`

Variant of `JSON_OBJ_DESCR_OBJECT` that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

**See also:**

[\*JSON\\_OBJ\\_DESCR\\_OBJECT\*](#)

**Parameters**

- `struct_` – Struct packing the values
- `json_field_name_` – String, field name in JSON strings

- `struct_field_name_` – Field name in the struct
- `sub_descr_` – Array of [json\\_obj\\_descr](#) describing the subobject

`JSON_OBJ_DESCR_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_type_)`

Variant of `JSON_OBJ_DESCR_ARRAY` that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

#### See also:

[JSON\\_OBJ\\_DESCR\\_ARRAY](#)

#### Parameters

- `struct_` – Struct packing the values
- `json_field_name_` – String, field name in JSON strings
- `struct_field_name_` – Field name in the struct
- `max_len_` – Maximum number of elements in array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_type_` – Element type, must be a primitive type

`JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)`

Variant of `JSON_OBJ_DESCR_OBJ_ARRAY` that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

Here's an example of use:

```
struct person_height {
    const char *name;
    int height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct people_heights,
                                    "people-heights", heights,
                                    10, heights_len,
                                    person_height_descr,
                                    ARRAY_SIZE(person_height_descr)),
};
```

### Parameters

- `struct_` – Struct packing the values
- `json_field_name_` – String, field name of the array in JSON strings
- `struct_field_name_` – Field name in the struct containing the array
- `max_len_` – Maximum number of elements in the array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_descr_` – Element descriptor, pointer to a descriptor array
- `elem_descr_len_` – Number of elements in `elem_descr_`

### Typedefs

```
typedef int (*json_append_bytes_t)(const char *bytes, size_t len, void *data)
```

Function pointer type to append bytes to a buffer while encoding JSON data.

**Param bytes** Contents to write to the output

**Param len** Number of bytes to append to output

**Param data** User-provided pointer

**Return** This callback function should return a negative number on error (which will be propagated to the return value of [json\\_obj\\_encode\(\)](#)), or 0 on success.

### Enums

```
enum json_tokens
```

*Values:*

```
enumerator JSON_TOK_NONE = '_'
```

```
enumerator JSON_TOK_OBJECT_START = '{'
```

```
enumerator JSON_TOK_OBJECT_END = '}'
```

```
enumerator JSON_TOK_LIST_START = '['
```

```

## Functions

```
int json_obj_parse(char *json, size_t len, const struct json_obj_descr *descr, size_t descr_len, void *val)
```

Parses the JSON-encoded object pointer to by *json*, with size *len*, according to the descriptor pointed to by *descr*. Values are stored in a struct pointed to by *val*. Set up the descriptor like this:

```
struct s { int foo; char *bar; } struct json_obj_descr descr[] = { JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER), JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING), };
```

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no `strtod()` in the minimal libc).

### Parameters

- *json* – Pointer to JSON-encoded value to be parsed
- *len* – Length of JSON-encoded value
- *descr* – Pointer to the descriptor array
- *descr\_len* – Number of elements in the descriptor array. Must be less than 31 due to implementation detail reasons (if more fields are necessary, use two descriptors)
- *val* – Pointer to the struct to hold the decoded values

**Returns** < 0 if error, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

```
ssize_t json_escape(char *str, size_t *len, size_t buf_size)
```

Escapes the string so it can be used to encode JSON objects.

### Parameters

- *str* – The string to escape; the escape string is stored the buffer pointed to by this parameter
- *len* – Points to a `size_t` containing the size before and after the escaping process
- *buf\_size* – The size of buffer *str* points to

**Returns** 0 if string has been escaped properly, or -ENOMEM if there was not enough space to escape the buffer

```
size_t json_calc_escaped_len(const char *str, size_t len)
```

Calculates the JSON-escaped string length.

### Parameters

- *str* – The string to analyze

- `len` – String size

**Returns** The length `str` would have if it were escaped

```
ssize_t json_calc_encoded_len(const struct json_obj_descr *descr, size_t descr_len, const void *val)
```

Calculates the string length to fully encode an object.

**Parameters**

- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array
- `val` – Struct holding the values

**Returns** Number of bytes necessary to encode the values if  $>0$ , an error code is returned.

```
int json_obj_encode_buf(const struct json_obj_descr *descr, size_t descr_len, const void *val, char *buffer, size_t buf_size)
```

Encodes an object in a contiguous memory location.

**Parameters**

- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array
- `val` – Struct holding the values
- `buffer` – Buffer to store the JSON data
- `buf_size` – Size of buffer, in bytes, with space for the terminating NUL character

**Returns** 0 if object has been successfully encoded. A negative value indicates an error (as defined on `errno.h`).

```
int json_arr_encode_buf(const struct json_obj_descr *descr, const void *val, char *buffer, size_t buf_size)
```

Encodes an array in a contiguous memory location.

**Parameters**

- `descr` – Pointer to the descriptor array
- `val` – Struct holding the values
- `buffer` – Buffer to store the JSON data
- `buf_size` – Size of buffer, in bytes, with space for the terminating NUL character

**Returns** 0 if object has been successfully encoded. A negative value indicates an error (as defined on `errno.h`).

```
int json_obj_encode(const struct json_obj_descr *descr, size_t descr_len, const void *val, json_append_bytes_t append_bytes, void *data)
```

Encodes an object using an arbitrary writer function.

**Parameters**

- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array
- `val` – Struct holding the values
- `append_bytes` – Function to append bytes to the output

- `data` – Data pointer to be passed to the `append_bytes` callback function.

**Returns** 0 if object has been successfully encoded. A negative value indicates an error.

```
int json_arr_encode(const struct json_obj_descr *descr, const void *val, json_append_bytes_t
    append_bytes, void *data)
```

Encodes an array using an arbitrary writer function.

#### Parameters

- `descr` – Pointer to the descriptor array
- `val` – Struct holding the values
- `append_bytes` – Function to append bytes to the output
- `data` – Data pointer to be passed to the `append_bytes` callback function.

**Returns** 0 if object has been successfully encoded. A negative value indicates an error.

```
struct json_obj_descr
    #include <json.h>
```

## JWT

JSON Web Tokens (JWT) are an open, industry standard [RFC 7519](<https://tools.ietf.org/html/rfc7519>) method for representing claims securely between two parties. Although JWT is fairly flexible, this API is limited to creating the simplistic tokens needed to authenticate with the Google Core IoT infrastructure.

*group* `jwt`

JSON Web Token (JWT)

## Functions

```
int jwt_init_builder(struct jwt_builder *builder, char *buffer, size_t buffer_size)
```

Initialize the JWT builder.

Initialize the given JWT builder for the creation of a fresh token. The buffer size should at least be as long as `JWT_BUILDER_MAX_SIZE` returns.

#### Parameters

- `builder` – The builder to initialize.
- `buffer` – The buffer to write the token to.
- `buffer_size` – The size of this buffer. The token will be NULL terminated, which needs to be allowed for in this size.

#### Return values

- 0 – Success
- `-ENOSPC` – Buffer is insufficient to initialize

```
int jwt_add_payload(struct jwt_builder *builder, int32_t exp, int32_t iat, const char *aud)
    add JWT primary payload.
```

```
int jwt_sign(struct jwt_builder *builder, const char *der_key, size_t der_key_len)
    Sign the JWT token.
```

```
static inline size_t jwt_payload_len(struct jwt_builder *builder)
```

```
struct jwt_builder
```

*#include <jwt.h>* JWT data tracking.

JSON Web Tokens contain several sections, each encoded in base-64. This structure tracks the token as it is being built, including limits on the amount of available space. It should be initialized with `jwt_init()`.

### Public Members

```
char *base
```

The base of the buffer we are writing to.

```
char *buf
```

The place in this buffer where we are currently writing.

```
size_t len
```

The length remaining to write.

```
bool overflowed
```

Flag that is set if we try to write past the end of the buffer. If set, the token is not valid.

## 7.18 Data Structures

Zephyr provides a library of common general purpose data structures used within the kernel, but useful by application code in general. These include list and balanced tree structures for storing ordered data, and a ring buffer for managing “byte stream” data in a clean way.

Note that in general, the collections are implemented as “intrusive” data structures. The “node” data is the only struct used by the library code, and it does not store a pointer or other metadata to indicate what user data is “owned” by that node. Instead, the expectation is that the node will be itself embedded within a user-defined struct. Macros are provided to retrieve a user struct address from the embedded node pointer in a clean way. The purpose behind this design is to allow the collections to be used in contexts where dynamic allocation is disallowed (i.e. there is no need to allocate node objects because the memory is provided by the user).

Note also that these libraries are uniformly unsynchronized; access to them is not threadsafe by default. These are data structures, not synchronization primitives. The expectation is that any locking needed will be provided by the user.

### 7.18.1 Single-linked List

Zephyr provides a `sys_slist_t` type for storing simple singly-linked list data (i.e. data where each list element stores a pointer to the next element, but not the previous one). This supports constant-time access to the first (head) and last (tail) elements of the list, insertion before the head and after the tail of the list and constant time removal of the head. Removal of subsequent nodes requires access to the “previous” pointer and thus can only be performed in linear time by searching the list.

The `sys_slist_t` struct may be instantiated by the user in any accessible memory. It should be initialized with either `sys_slist_init()` or by static assignment from `SYS_SLIST_STATIC_INIT` before use. Its interior fields are opaque and should not be accessed by user code.

The end nodes of a list may be retrieved with `sys_slist_peek_head()` and `sys_slist_peek_tail()`, which will return NULL if the list is empty, otherwise a pointer to a `sys_snode_t` struct.

The `sys_snode_t` struct represents the data to be inserted. In general, it is expected to be allocated/controlled by the user, usually embedded within a struct which is to be added to the list. The container struct pointer may be retrieved from a list node using `SYS_SLIST_CONTAINER`, passing it the struct name of the containing struct and the field name of the node. Internally, the `sys_snode_t` struct contains only a next pointer, which may be accessed with `sys_slist_peek_next()`.

Lists may be modified by adding a single node at the head or tail with `sys_slist_prepend()` and `sys_slist_append()`. They may also have a node added to an interior point with `sys_slist_insert()`, which inserts a new node after an existing one. Similarly `sys_slist_remove()` will remove a node given a pointer to its predecessor. These operations are all constant time.

Convenience routines exist for more complicated modifications to a list. `sys_slist_merge_slist()` will append an entire list to an existing one. `sys_slist_append_list()` will append a bounded subset of an existing list in constant time. And `sys_slist_find_and_remove()` will search a list (in linear time) for a given node and remove it if present.

Finally the slist implementation provides a set of “for each” macros that allows for iterating over a list in a natural way without needing to manually traverse the next pointers. `SYS_SLIST_FOR_EACH_NODE` will enumerate every node in a list given a local variable to store the node pointer. `SYS_SLIST_FOR_EACH_NODE_SAFE` behaves similarly, but has a more complicated implementation that requires an extra scratch variable for storage and allows the user to delete the iterated node during the iteration. Each of those macros also exists in a “container” variant (`SYS_SLIST_FOR_EACH_CONTAINER` and `SYS_SLIST_FOR_EACH_CONTAINER_SAFE`) which assigns a local variable of a type that matches the user’s container struct and not the node struct, performing the required offsets internally. And `SYS_SLIST_ITERATE_FROM_NODE` exists to allow for enumerating a node and all its successors only, without inspecting the earlier part of the list.

### Single-linked List Internals

The slist code is designed to be minimal and conventional. Internally, a `sys_slist_t` struct is nothing more than a pair of “head” and “tail” pointer fields. And a `sys_snode_t` stores only a single “next” pointer.

Fig. 3: An slist containing three elements.

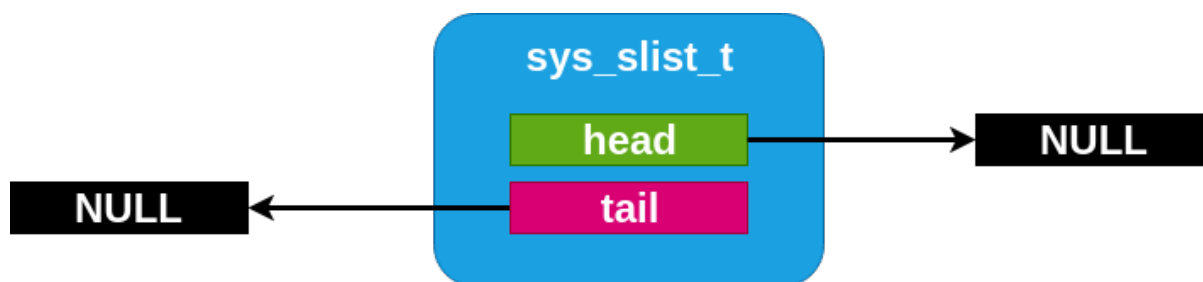

Fig. 4: An empty slist

The specific implementation of the list code, however, is done with an internal “Z\_GENLIST” template API which allows for extracting those fields from arbitrary structures and emits an arbitrarily named set

of functions. This allows for implementing more complicated single-linked list variants using the same basic primitives. The genlist implementor is responsible for a custom implementation of the primitive operations only: an “init” step for each struct, and a “get” and “set” primitives for each of head, tail and next pointers on their relevant structs. These inline functions are passed as parameters to the genlist macro expansion.

Only one such variant, slist, exists in Zephyr at the moment.

## Flagged List

The `sys_sflist_t` is implemented using the described genlist template API. With the exception of symbol naming (“sflist” instead of “slist”) and the additional API described next, it operates in all ways identically to the slist API.

It adds the ability to associate exactly two bits of user defined “flags” with each list node. These can be accessed and modified with `sys_sfnode_flags_get()` and `sys_sfnode_flags_set()`. Internally, the flags are stored unioned with the bottom bits of the next pointer and incur no SRAM storage overhead when compared with the simpler slist code.

## Single-linked List API Reference

group single-linked-list\_apis

### Defines

`SYS_SLIST_FOR_EACH_NODE(__sl, __sn)`

Provide the primitive to iterate on a list Note: the loop is unsafe and thus `__sn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SLIST_FOR_EACH_NODE(l, n) {
    <user code>
}
```

This and other `SYS_SLIST_*`() macros are not thread safe.

#### Parameters

- `__sl` – A pointer on a `sys_slist_t` to iterate on
- `__sn` – A `sys_snode_t` pointer to peek each node of the list

`SYS_SLIST_ITERATE_FROM_NODE(__sl, __sn)`

Provide the primitive to iterate on a list, from a node in the list Note: the loop is unsafe and thus `__sn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SLIST_ITERATE_FROM_NODE(l, n) {
    <user code>
}
```

Like `SYS_SLIST_FOR_EACH_NODE()`, but `__dn` already contains a node in the list where to start searching for the next entry from. If NULL, it starts from the head.

This and other `SYS_SLIST_*`() macros are not thread safe.

#### Parameters

- `__sl` – A pointer on a `sys_slist_t` to iterate on
- `__sn` – A `sys_snode_t` pointer to peek each node of the list it contains the starting node, or `NULL` to start from the head

`SYS_SLIST_FOR_EACH_NODE_SAFE(__sl, __sn, __sns)`

Provide the primitive to safely iterate on a list Note: `__sn` can be removed, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SLIST_FOR_EACH_NODE_SAFE(l, n, s) {  
    <user code>  
}
```

This and other `SYS_SLIST_*`() macros are not thread safe.

#### Parameters

- `__sl` – A pointer on a `sys_slist_t` to iterate on
- `__sn` – A `sys_snode_t` pointer to peek each node of the list
- `__sns` – A `sys_snode_t` pointer for the loop to run safely

`SYS_SLIST_CONTAINER(__ln, __cn, __n)`

`SYS_SLIST_PEEK_HEAD_CONTAINER(__sl, __cn, __n)`

`SYS_SLIST_PEEK_TAIL_CONTAINER(__sl, __cn, __n)`

`SYS_SLIST_PEEK_NEXT_CONTAINER(__cn, __n)`

`SYS_SLIST_FOR_EACH_CONTAINER(__sl, __cn, __n)`

Provide the primitive to iterate on a list under a container Note: the loop is unsafe and thus `__cn` should not be detached.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SLIST_FOR_EACH_CONTAINER(l, c, n) {  
    <user code>  
}
```

#### Parameters

- `__sl` – A pointer on a `sys_slist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list
- `__n` – The field name of `sys_node_t` within the container struct

`SYS_SLIST_FOR_EACH_CONTAINER_SAFE(__sl, __cn, __cns, __n)`

Provide the primitive to safely iterate on a list under a container Note: `__cn` can be detached, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SLIST_FOR_EACH_NODE_SAFE(l, c, cn, n) {  
    <user code>  
}
```

#### Parameters

- `__sl` – A pointer on a `sys_slist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list

- `__cns` – A pointer for the loop to run safely
- `__n` – The field name of `sys_node_t` within the container struct

`SYS_SLIST_STATIC_INIT(ptr_to_list)`

## Functions

`static inline void sys_slist_init(sys_slist_t *list)`

Initialize a list.

### Parameters

- `list` – A pointer on the list to initialize

`static inline sys_snode_t *sys_slist_peek_head(sys_slist_t *list)`

Peek the first node from the list.

### Parameters

- `list` – A point on the list to peek the first node from

**Returns** A pointer on the first node of the list (or NULL if none)

`static inline sys_snode_t *sys_slist_peek_tail(sys_slist_t *list)`

Peek the last node from the list.

### Parameters

- `list` – A point on the list to peek the last node from

**Returns** A pointer on the last node of the list (or NULL if none)

`static inline bool sys_slist_is_empty(sys_slist_t *list)`

Test if the given list is empty.

### Parameters

- `list` – A pointer on the list to test

**Returns** a boolean, true if it's empty, false otherwise

`static inline sys_snode_t *sys_slist_peek_next_no_check(sys_snode_t *node)`

Peek the next node from current node, node is not NULL.

Faster than [`sys\_slist\_peek\_next\(\)`](#) if node is known not to be NULL.

### Parameters

- `node` – A pointer on the node where to peek the next node

**Returns** a pointer on the next node (or NULL if none)

`static inline sys_snode_t *sys_slist_peek_next(sys_snode_t *node)`

Peek the next node from current node.

### Parameters

- `node` – A pointer on the node where to peek the next node

**Returns** a pointer on the next node (or NULL if none)

`static inline void sys_slist_prepend(sys_slist_t *list, sys_snode_t *node)`

Prepend a node to the given list.

This and other `sys_slist_*` functions are not thread safe.

### Parameters

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to prepend

```
static inline void sys_slist_append(sys_slist_t *list, sys_snode_t *node)
```

Append a node to the given list.

This and other `sys_slist_*`() functions are not thread safe.

#### Parameters

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to append

```
static inline void sys_slist_append_list(sys_slist_t *list, void *head, void *tail)
```

Append a list to the given list.

Append a singly-linked, NULL-terminated list consisting of nodes containing the pointer to the next node as the first element of a node, to *list*. This and other `sys_slist_*`() functions are not thread safe.

FIXME: Why are the element parameters void \*?

#### Parameters

- `list` – A pointer on the list to affect
- `head` – A pointer to the first element of the list to append
- `tail` – A pointer to the last element of the list to append

```
static inline void sys_slist_merge_slist(sys_slist_t *list, sys_slist_t *list_to_append)
```

merge two slists, appending the second one to the first

When the operation is completed, the appending list is empty. This and other `sys_slist_*`() functions are not thread safe.

#### Parameters

- `list` – A pointer on the list to affect
- `list_to_append` – A pointer to the list to append.

```
static inline void sys_slist_insert(sys_slist_t *list, sys_snode_t *prev, sys_snode_t *node)
```

Insert a node to the given list.

This and other `sys_slist_*`() functions are not thread safe.

#### Parameters

- `list` – A pointer on the list to affect
- `prev` – A pointer on the previous node
- `node` – A pointer on the node to insert

```
static inline sys_snode_t *sys_slist_get_not_empty(sys_slist_t *list)
```

Fetch and remove the first node of the given list.

List must be known to be non-empty. This and other `sys_slist_*`() functions are not thread safe.

#### Parameters

- `list` – A pointer on the list to affect

**Returns** A pointer to the first node of the list

```
static inline sys_snode_t *sys_slist_get(sys_slist_t *list)
```

Fetch and remove the first node of the given list.

This and other `sys_slist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect

**Returns** A pointer to the first node of the list (or NULL if empty)

```
static inline void sys_slist_remove(sys_slist_t *list, sys_snode_t *prev_node, sys_snode_t *node)
```

Remove a node.

This and other `sys_slist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `prev_node` – A pointer on the previous node (can be NULL, which means the node is the list's head)
- `node` – A pointer on the node to remove

```
static inline bool sys_slist_find_and_remove(sys_slist_t *list, sys_snode_t *node)
```

Find and remove a node from a list.

This and other `sys_slist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to remove from the list

**Returns** true if node was removed

## Flagged List API Reference

*group* `flagged-single-linked-list_apis`

### Defines

```
SYS_SFLIST_FOR_EACH_NODE(__sl, __sn)
```

Provide the primitive to iterate on a list Note: the loop is unsafe and thus `__sn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SFLIST_FOR_EACH_NODE(l, n) {  
    <user code>  
}
```

This and other `SYS_SFLIST_*`() macros are not thread safe.

**Parameters**

- `__sl` – A pointer on a `sys_sflist_t` to iterate on
- `__sn` – A `sys_sfnode_t` pointer to peek each node of the list

`SYS_SFLIST_ITERATE_FROM_NODE(__sl, __sn)`

Provide the primitive to iterate on a list, from a node in the list Note: the loop is unsafe and thus `__sn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SFLIST_ITERATE_FROM_NODE(1, n) {  
    <user code>  
}
```

Like [SYS\\_SFLIST\\_FOR\\_EACH\\_NODE\(\)](#), but `__dn` already contains a node in the list where to start searching for the next entry from. If NULL, it starts from the head.

This and other `SYS_SFLIST_*`() macros are not thread safe.

#### Parameters

- `__sl` – A pointer on a `sys_sflist_t` to iterate on
- `__sn` – A `sys_sfnode_t` pointer to peek each node of the list it contains the starting node, or NULL to start from the head

`SYS_SFLIST_FOR_EACH_NODE_SAFE(__sl, __sn, __sns)`

Provide the primitive to safely iterate on a list Note: `__sn` can be removed, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SFLIST_FOR_EACH_NODE_SAFE(1, n, s) {  
    <user code>  
}
```

This and other `SYS_SFLIST_*`() macros are not thread safe.

#### Parameters

- `__sl` – A pointer on a `sys_sflist_t` to iterate on
- `__sn` – A `sys_sfnode_t` pointer to peek each node of the list
- `__sns` – A `sys_sfnode_t` pointer for the loop to run safely

`SYS_SFLIST_CONTAINER(__ln, __cn, __n)`

`SYS_SFLIST_PEEK_HEAD_CONTAINER(__sl, __cn, __n)`

`SYS_SFLIST_PEEK_TAIL_CONTAINER(__sl, __cn, __n)`

`SYS_SFLIST_PEEK_NEXT_CONTAINER(__cn, __n)`

`SYS_SFLIST_FOR_EACH_CONTAINER(__sl, __cn, __n)`

Provide the primitive to iterate on a list under a container Note: the loop is unsafe and thus `__cn` should not be detached.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SFLIST_FOR_EACH_CONTAINER(1, c, n) {  
    <user code>  
}
```

#### Parameters

- `__sl` – A pointer on a `sys_sflist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list
- `__n` – The field name of `sys_sfnode_t` within the container struct

`SYS_SFLIST_FOR_EACH_CONTAINER_SAFE(__sl, __cn, __cns, __n)`

Provide the primitive to safely iterate on a list under a container Note: `__cn` can be detached, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_SFLIST_FOR_EACH_NODE_SAFE(l, c, cn, n) {  
    <user code>  
}
```

#### Parameters

- `__sl` – A pointer on a `sys_sflist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list
- `__cns` – A pointer for the loop to run safely
- `__n` – The field name of `sys_sfnode_t` within the container struct

`SYS_SFLIST_STATIC_INIT(ptr_to_list)`

`SYS_SFLIST_FLAGS_MASK`

### Functions

`static inline void sys_sflist_init(sys_sflist_t *list)`

Initialize a list.

#### Parameters

- `list` – A pointer on the list to initialize

`static inline uint8_t sys_sfnode_flags_get(sys_sfnode_t *node)`

Fetch flags value for a particular sfnode.

#### Parameters

- `node` – A pointer to the node to fetch flags from

**Returns** The value of flags, which will be between 0 and 3

`static inline sys_sfnode_t *sys_sflist_peek_head(sys_sflist_t *list)`

Peek the first node from the list.

#### Parameters

- `list` – A point on the list to peek the first node from

**Returns** A pointer on the first node of the list (or NULL if none)

`static inline sys_sfnode_t *sys_sflist_peek_tail(sys_sflist_t *list)`

Peek the last node from the list.

#### Parameters

- `list` – A point on the list to peek the last node from

**Returns** A pointer on the last node of the list (or NULL if none)

```
static inline void sys_sfnode_init(sys_sfnode_t *node, uint8_t flags)
```

Initialize an sfnlist node.

Set an initial flags value for this sfnlist node, which can be a value between 0 and 3. These flags will persist even if the node is moved around within a list, removed, or transplanted to a different sfnlist.

This is ever so slightly faster than [sys\\_sfnode\\_flags\\_set\(\)](#) and should only be used on a node that hasn't been added to any list.

#### Parameters

- `node` – A pointer to the node to set the flags on
- `flags` – A value between 0 and 3 to set the flags value

```
static inline void sys_sfnode_flags_set(sys_sfnode_t *node, uint8_t flags)
```

Set flags value for an sfnlist node.

Set a flags value for this sfnlist node, which can be a value between 0 and 3. These flags will persist even if the node is moved around within a list, removed, or transplanted to a different sfnlist.

#### Parameters

- `node` – A pointer to the node to set the flags on
- `flags` – A value between 0 and 3 to set the flags value

```
static inline bool sys_sflist_is_empty(sys_sflist_t *list)
```

Test if the given list is empty.

#### Parameters

- `list` – A pointer on the list to test

**Returns** a boolean, true if it's empty, false otherwise

```
static inline sys_sfnode_t *sys_sflist_peek_next_no_check(sys_sfnode_t *node)
```

Peek the next node from current node, node is not NULL.

Faster than [sys\\_sflist\\_peek\\_next\(\)](#) if node is known not to be NULL.

#### Parameters

- `node` – A pointer on the node where to peek the next node

**Returns** a pointer on the next node (or NULL if none)

```
static inline sys_sfnode_t *sys_sflist_peek_next(sys_sfnode_t *node)
```

Peek the next node from current node.

#### Parameters

- `node` – A pointer on the node where to peek the next node

**Returns** a pointer on the next node (or NULL if none)

```
static inline void sys_sflist_prepend(sys_sflist_t *list, sys_sfnode_t *node)
```

Prepend a node to the given list.

This and other `sys_sflist_*`() functions are not thread safe.

#### Parameters

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to prepend

```
static inline void sys_sflist_append(sys_sflist_t *list, sys_sfnode_t *node)
```

Append a node to the given list.

This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to append

```
static inline void sys_sflist_append_list(sys_sflist_t *list, void *head, void *tail)
```

Append a list to the given list.

Append a singly-linked, NULL-terminated list consisting of nodes containing the pointer to the next node as the first element of a node, to `list`. This and other `sys_sflist_*`() functions are not thread safe.

FIXME: Why are the element parameters void \*?

**Parameters**

- `list` – A pointer on the list to affect
- `head` – A pointer to the first element of the list to append
- `tail` – A pointer to the last element of the list to append

```
static inline void sys_sflist_merge_sflist(sys_sflist_t *list, sys_sflist_t *list_to_append)
```

merge two sflists, appending the second one to the first

When the operation is completed, the appending list is empty. This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `list_to_append` – A pointer to the list to append.

```
static inline void sys_sflist_insert(sys_sflist_t *list, sys_sfnode_t *prev, sys_sfnode_t *node)
```

Insert a node to the given list.

This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `prev` – A pointer on the previous node
- `node` – A pointer on the node to insert

```
static inline sys_sfnode_t *sys_sflist_get_not_empty(sys_sflist_t *list)
```

Fetch and remove the first node of the given list.

List must be known to be non-empty. This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect

**Returns** A pointer to the first node of the list

```
static inline sys_sfnode_t *sys_sflist_get(sys_sflist_t *list)
```

Fetch and remove the first node of the given list.

This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect

**Returns** A pointer to the first node of the list (or NULL if empty)

```
static inline void sys_sflist_remove(sys_sflist_t *list, sys_sfnode_t *prev_node, sys_sfnode_t *node)
```

Remove a node.

This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `prev_node` – A pointer on the previous node (can be NULL, which means the node is the list's head)
- `node` – A pointer on the node to remove

```
static inline bool sys_sflist_find_and_remove(sys_sflist_t *list, sys_sfnode_t *node)
```

Find and remove a node from a list.

This and other `sys_sflist_*`() functions are not thread safe.

**Parameters**

- `list` – A pointer on the list to affect
- `node` – A pointer on the node to remove from the list

**Returns** true if node was removed

## 7.18.2 Double-linked List

Similar to the single-linked list in many respects, Zephyr includes a double-linked implementation. This provides the same algorithmic behavior for all the existing slist operations, but also allows for constant-time removal and insertion (at all points: before or after the head, tail or any internal node). To do this, the list stores two pointers per node, and thus has somewhat higher runtime code and memory space needs.

A `sys_dlist_t` struct may be instantiated by the user in any accessible memory. It must be initialized with `sys_dlist_init()` or `SYS_DLIST_STATIC_INIT` before use. The `sys_dnode_t` struct is expected to be provided by the user for any nodes added to the list (typically embedded within the struct to be tracked, as described above). It must be initialized in zeroed/bss memory or with `sys_dnode_init()` before use.

Primitive operations may retrieve the head/tail of a list and the next/prev pointers of a node with `sys_dlist_peek_head()`, `sys_dlist_peek_tail()`, `sys_dlist_peek_next()` and `sys_dlist_peek_prev()`. These can all return NULL where appropriate (i.e. for empty lists, or nodes at the endpoints of the list).

A dlist can be modified in constant time by removing a node with `sys_dlist_remove()`, by adding a node to the head or tail of a list with `sys_dlist_prepend()` and `sys_dlist_append()`, or by inserting a node before an existing node with `sys_dlist_insert()`.

As for slist, each node in a dlist can be processed in a natural code block style using `SYS_DLIST_FOR_EACH_NODE`. This macro also exists in a “FROM\_NODE” form which allows for iterating from a known starting point, a “SAFE” variant that allows for removing the node being inspected within the code block, a “CONTAINER” style that provides the pointer to a containing struct instead of the raw node, and a “CONTAINER\_SAFE” variant that provides both properties.

Convenience utilities provided by dlist include `sys_dlist_insert_at()`, which inserts a node that linearly searches through a list to find the right insertion point, which is provided by the user as a C callback function pointer, and `sys_dnode_is_linked()`, which will affirmatively return whether or not a node is currently linked into a dlist or not (via an implementation that has zero overhead vs. the normal list processing).

## Double-linked List Internals

Internally, the dlist implementation is minimal: the `sys_dlist_t` struct contains “head” and “tail” pointer fields, the `sys_dnode_t` contains “prev” and “next” pointers, and no other data is stored. But in practice the two structs are internally identical, and the list struct is inserted as a node into the list itself. This allows for a very clean symmetry of operations:

- An empty list has backpointers to itself in the list struct, which can be trivially detected.
- The head and tail of the list can be detected by comparing the prev/next pointers of a node vs. the list struct address.
- An insertion or deletion never needs to check for the special case of inserting at the head or tail. There are never any NULL pointers within the list to be avoided. Exactly the same operations are run, without tests or branches, for all list modification primitives.

Effectively, a dlist of  $N$  nodes can be thought of as a “ring” of  $N+1$  nodes, where one node represents the list tracking struct.

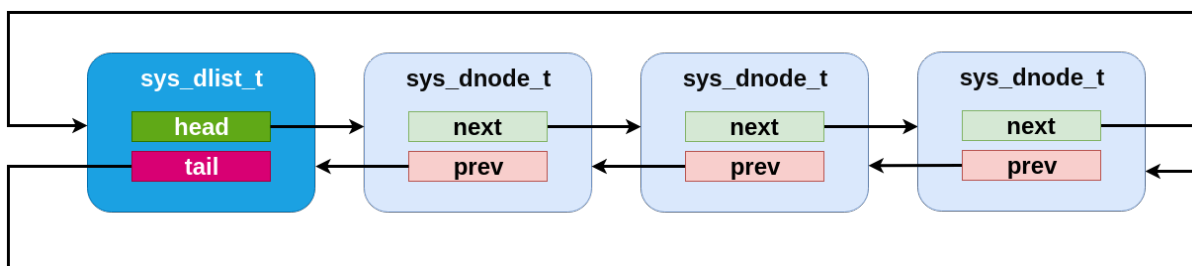

Fig. 5: A dlist containing three elements. Note that the list struct appears as a fourth “element” in the list.

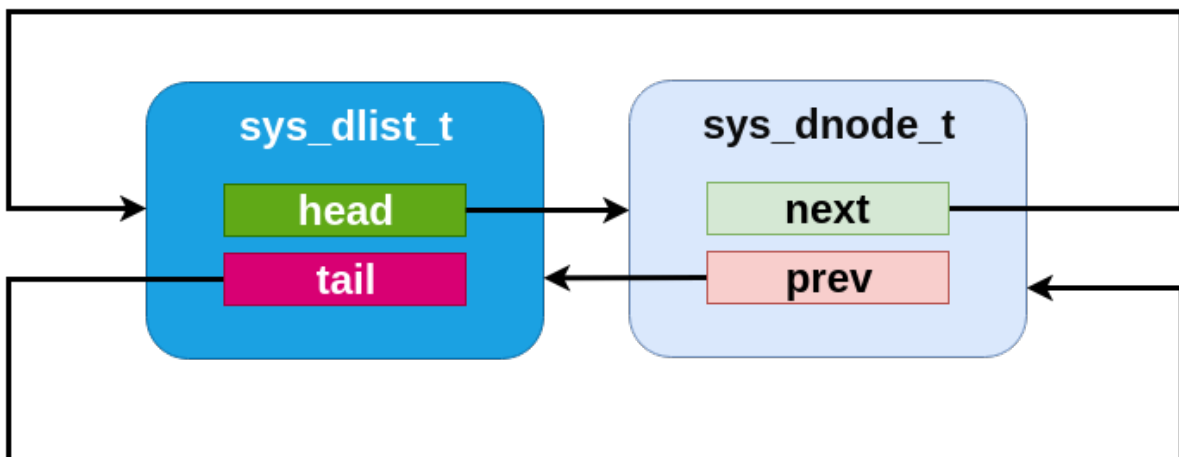

Fig. 6: An dlist containing just one element.

## Doubly-linked List API Reference

`group doubly-linked-list_apis`

### Defines

Fig. 7: An empty dlist.

`SYS_DLIST_FOR_EACH_NODE(__dl, __dn)`

Provide the primitive to iterate on a list. Note: the loop is unsafe and thus `__dn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_DLIST_FOR_EACH_NODE(l, n) {
    <user code>
}
```

This and other `SYS_DLIST_*` macros are not thread safe.

#### Parameters

- `__dl` – A pointer on a `sys_dlist_t` to iterate on
- `__dn` – A `sys_dnode_t` pointer to peek each node of the list

`SYS_DLIST_ITERATE_FROM_NODE(__dl, __dn)`

Provide the primitive to iterate on a list, from a node in the list. Note: the loop is unsafe and thus `__dn` should not be removed.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_DLIST_ITERATE_FROM_NODE(l, n) {
    <user code>
}
```

Like `SYS_DLIST_FOR_EACH_NODE()`, but `__dn` already contains a node in the list where to start searching for the next entry from. If `NULL`, it starts from the head.

This and other `SYS_DLIST_*` macros are not thread safe.

#### Parameters

- `__dl` – A pointer on a `sys_dlist_t` to iterate on
- `__dn` – A `sys_dnode_t` pointer to peek each node of the list; it contains the starting node, or `NULL` to start from the head

`SYS_DLIST_FOR_EACH_NODE_SAFE(__dl, __dn, __dns)`

Provide the primitive to safely iterate on a list Note: `__dn` can be removed, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_DLIST_FOR_EACH_NODE_SAFE(1, n, s) {  
    <user code>  
}
```

This and other `SYS_DLIST_*`() macros are not thread safe.

#### Parameters

- `__dl` – A pointer on a `sys_dlist_t` to iterate on
- `__dn` – A `sys_dnode_t` pointer to peek each node of the list
- `__dns` – A `sys_dnode_t` pointer for the loop to run safely

`SYS_DLIST_CONTAINER(__dn, __cn, __n)`

`SYS_DLIST_PEEK_HEAD_CONTAINER(__dl, __cn, __n)`

`SYS_DLIST_PEEK_NEXT_CONTAINER(__dl, __cn, __n)`

`SYS_DLIST_FOR_EACH_CONTAINER(__dl, __cn, __n)`

Provide the primitive to iterate on a list under a container Note: the loop is unsafe and thus `__cn` should not be detached.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_DLIST_FOR_EACH_CONTAINER(1, c, n) {  
    <user code>  
}
```

#### Parameters

- `__dl` – A pointer on a `sys_dlist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list
- `__n` – The field name of `sys_dnode_t` within the container struct

`SYS_DLIST_FOR_EACH_CONTAINER_SAFE(__dl, __cn, __cns, __n)`

Provide the primitive to safely iterate on a list under a container Note: `__cn` can be detached, it will not break the loop.

User *MUST* add the loop statement curly braces enclosing its own code:

```
SYS_DLIST_FOR_EACH_CONTAINER_SAFE(1, c, cn, n) {  
    <user code>  
}
```

#### Parameters

- `__dl` – A pointer on a `sys_dlist_t` to iterate on
- `__cn` – A pointer to peek each entry of the list
- `__cns` – A pointer for the loop to run safely
- `__n` – The field name of `sys_dnode_t` within the container struct

`SYS_DLIST_STATIC_INIT(ptr_to_list)`

## Typedefs

```
typedef struct _dnode sys_dlist_t
```

```
typedef struct _dnode sys_dnode_t
```

## Functions

```
static inline void sys_dlist_init(sys\_dlist\_t *list)
```

initialize list to its empty state

### Parameters

- `list` – the doubly-linked list

**Returns** N/A

```
static inline void sys_dnode_init(sys\_dnode\_t *node)
```

initialize node to its state when not in a list

### Parameters

- `node` – the node

**Returns** N/A

```
static inline bool sys_dnode_is_linked(const sys\_dnode\_t *node)
```

check if a node is a member of any list

### Parameters

- `node` – the node

**Returns** true if node is linked into a list, false if it is not

```
static inline bool sys_dlist_is_head(sys\_dlist\_t *list, sys\_dnode\_t *node)
```

check if a node is the list's head

### Parameters

- `list` – the doubly-linked list to operate on
- `node` – the node to check

**Returns** true if node is the head, false otherwise

```
static inline bool sys_dlist_is_tail(sys\_dlist\_t *list, sys\_dnode\_t *node)
```

check if a node is the list's tail

### Parameters

- `list` – the doubly-linked list to operate on
- `node` – the node to check

**Returns** true if node is the tail, false otherwise

```
static inline bool sys_dlist_is_empty(sys\_dlist\_t *list)
```

check if the list is empty

### Parameters

- `list` – the doubly-linked list to operate on

**Returns** true if empty, false otherwise

static inline bool sys\_dlist\_has\_multiple\_nodes([sys\\_dlist\\_t](#) \*list)

check if more than one node present

This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `list` – the doubly-linked list to operate on

**Returns** true if multiple nodes, false otherwise

static inline [sys\\_dnode\\_t](#) \*sys\_dlist\_peek\_head([sys\\_dlist\\_t](#) \*list)

get a reference to the head item in the list

**Parameters**

- `list` – the doubly-linked list to operate on

**Returns** a pointer to the head element, NULL if list is empty

static inline [sys\\_dnode\\_t](#) \*sys\_dlist\_peek\_head\_not\_empty([sys\\_dlist\\_t](#) \*list)

get a reference to the head item in the list

The list must be known to be non-empty.

**Parameters**

- `list` – the doubly-linked list to operate on

**Returns** a pointer to the head element

static inline [sys\\_dnode\\_t](#) \*sys\_dlist\_peek\_next\_no\_check([sys\\_dlist\\_t](#) \*list, [sys\\_dnode\\_t](#) \*node)

get a reference to the next item in the list, node is not NULL

Faster than [sys\\_dlist\\_peek\\_next\(\)](#) if node is known not to be NULL.

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the node from which to get the next element in the list

**Returns** a pointer to the next element from a node, NULL if node is the tail

static inline [sys\\_dnode\\_t](#) \*sys\_dlist\_peek\_next([sys\\_dlist\\_t](#) \*list, [sys\\_dnode\\_t](#) \*node)

get a reference to the next item in the list

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the node from which to get the next element in the list

**Returns** a pointer to the next element from a node, NULL if node is the tail or NULL (when node comes from reading the head of an empty list).

static inline [sys\\_dnode\\_t](#) \*sys\_dlist\_peek\_prev\_no\_check([sys\\_dlist\\_t](#) \*list, [sys\\_dnode\\_t](#) \*node)

get a reference to the previous item in the list, node is not NULL

Faster than [sys\\_dlist\\_peek\\_prev\(\)](#) if node is known not to be NULL.

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the node from which to get the previous element in the list

**Returns** a pointer to the previous element from a node, NULL if node is the tail

```
static inline sys\_dnode\_t *sys_dlist_peek_prev(sys\_dlist\_t *list, sys\_dnode\_t *node)
```

get a reference to the previous item in the list

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the node from which to get the previous element in the list

**Returns** a pointer to the previous element from a node, NULL if node is the tail or NULL (when node comes from reading the head of an empty list).

```
static inline sys\_dnode\_t *sys_dlist_peek_tail(sys\_dlist\_t *list)
```

get a reference to the tail item in the list

**Parameters**

- `list` – the doubly-linked list to operate on

**Returns** a pointer to the tail element, NULL if list is empty

```
static inline void sys_dlist_append(sys\_dlist\_t *list, sys\_dnode\_t *node)
```

add node to tail of list

This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the element to append

**Returns** N/A

```
static inline void sys_dlist_prepend(sys\_dlist\_t *list, sys\_dnode\_t *node)
```

add node to head of list

This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the element to append

**Returns** N/A

```
static inline void sys_dlist_insert(sys\_dnode\_t *successor, sys\_dnode\_t *node)
```

Insert a node into a list.

Insert a node before a specified node in a dlist.

**Parameters**

- `successor` – the position before which “node” will be inserted
- `node` – the element to insert

```
static inline void sys_dlist_insert_at(sys\_dlist\_t *list, sys\_dnode\_t *node, int  
                                     (*cond)(sys\_dnode\_t *node, void *data), void *data)
```

insert node at position

Insert a node in a location depending on a external condition. The `cond()` function checks if the node is to be inserted *before* the current node against which it is checked. This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `list` – the doubly-linked list to operate on
- `node` – the element to insert

- `cond` – a function that determines if the current node is the correct insert point
- `data` – parameter to `cond()`

**Returns** N/A

static inline void `sys_dlist_remove(sys_dnode_t *node)`

remove a specific node from a list

The list is implicit from the node. The node must be part of a list. This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `node` – the node to remove

**Returns** N/A

static inline `sys_dnode_t *sys_dlist_get(sys_dlist_t *list)`

get the first node in a list

This and other `sys_dlist_*`() functions are not thread safe.

**Parameters**

- `list` – the doubly-linked list to operate on

**Returns** the first node in the list, NULL if list is empty

### 7.18.3 Multi Producer Single Consumer Packet Buffer

A *Multi Producer Single Consumer Packet Buffer (MPSC\_PBUF)* is a circular buffer, whose contents are stored in first-in-first-out order. Variable size packets are stored in the buffer. Packet buffer works under assumption that there is a single context that consumes the data. However, it is possible that another context may interfere to flush the data and never come back (panic case). Packet is produced in two steps: first requested amount of data is allocated, producer fills the data and commits it. Consuming a packet is also performed in two steps: consumer claims the packet, gets pointer to it and length and later on packet is freed. This approach reduces memory copying.

A *MPSC Packet Buffer* has the following key properties:

- Allocate, commit scheme used for packet producing.
- Claim, free scheme used for packet consuming.
- Allocator ensures that continue memory of requested length is allocated.
- Following policies can be applied when requested space cannot be allocated:
  - **Overwrite** - oldest entries are dropped until requested amount of memory can be allocated. For each dropped packet user callback is called.
  - **No overwrite** - When requested amount of space cannot be allocated, allocation fails.
- Dedicated, optimized API for storing short packets.
- Allocation with timeout.

#### Internals

Each packet in the buffer contains MPSC\_PBUF specific header which is used for internal management. Header consists of 2 bit flags. In order to optimize memory usage, header can be added on top of the user header using MPSC\_PBUF\_HDR and remaining bits in the first word can be application specific. Header consists of following flags:

- `valid` - bit set to one when packet contains valid user packet

- busy - bit set when packet is being consumed (claimed but not free)

Header state:

valid	busy	description
0	0	space is free
1	0	valid packet
1	1	claimed valid packet
0	1	internal skip packet

Packet buffer space contains free space, valid user packets and internal skip packets. Internal skip packets indicates padding, e.g. at the of the buffer.

**Allocation** Using pairs for read and write indexes, available space is determined. If space can be allocated, temporary write index is moved and pointer to a space witing buffer is returned. Packet header is reset. If allocation required wrapping of the write index, a skip packet is added to the end of buffer. If space cannot be allocated and overwrite is disabled then NULL pointer is returned or context blocks if allocation was with timeout.

**Allocation with overwrite** If overwrite is enabled, oldest packets are dropped until requested amount of space can be allocated. When packets are dropped busy flag is checked in the header to ensure that currently consumed packet is not overwritten. In that case, skip packet is added before busy packet and packets following the busy packet are dropped. When busy packet is being freed, such situation is detected and packet is converted to skip packet to avoid double processing.

## Usage

**Packet header definition** Packet header details can be found in [include/sys/mpsc\\_packet.h](#). API functions can be found in [include/sys/mpsc\\_pbuf.h](#). Headers are split to avoid include spam when declaring the packet.

User header structure must start with internal header:

```
#include <sys/mpsc_packet.h>

struct foo_header {
    MPSC_PBUF_HDR;
    uint32_t length: 32 - MPSC_PBUF_HDR_BITS;
};
```

**Packet buffer configuration** Configuration structure contains buffer details, configuration flags and callbacks. Following callbacks are used by the packet buffer:

- Drop notification - callback called whenever a packet is dropped due to overwrite.
- Get packet length - callback to determine packet length

**Packet producing** Standard, two step method:

```
foo_packet *packet = mpsc_pbuf_alloc(buffer, len, K_NO_WAIT);

fill_data(packet);

mpsc_pbuf_commit(buffer, packet);
```

Performance optimized storing of small packets:

- 32 bit word packet
- 32 bit word with pointer packet

Note that since packets are written by value, they should already contain valid bit set in the header.

```
mpsc_pbuf_put_word(buffer, data);
mpsc_pbuf_put_word_ext(buffer, data, ptr);
```

**Packet consuming** Two step method:

```
foo_packet *packet = mpsc_pbuf_claim(buffer);

process(packet);

mpsc_pbuf_free(buffer, packet);
```

### 7.18.4 Balanced Red/Black Tree

For circumstances where sorted containers may become large at runtime, a list becomes problematic due to algorithmic costs of searching it. For these situations, Zephyr provides a balanced tree implementation which has runtimes on search and removal operations bounded at  $O(\log_2(N))$  for a tree of size  $N$ . This is implemented using a conventional red/black tree as described by multiple academic sources.

The `rbtree` tracking struct for a `rbtree` may be initialized anywhere in user accessible memory. It should contain only zero bits before first use. No specific initialization API is needed or required.

Unlike a list, where position is explicit, the ordering of nodes within an `rbtree` must be provided as a predicate function by the user. A function of type `rb_less_than_t()` should be assigned to the `less_than_fn` field of the `:c:struct`rbtree`` struct before any tree operations are attempted. This function should, as its name suggests, return a boolean `True` value if the first node argument is “less than” the second in the ordering desired by the tree. Note that “equal” is not allowed, nodes within a tree must have a single fixed order for the algorithm to work correctly.

As with the `slist` and `dlist` containers, nodes within an `rbtree` are represented as a `rbnode` structure which exists in user-managed memory, typically embedded within the the data structure being tracked in the tree. Unlike the list code, the data within an `rbnode` is entirely opaque. It is not possible for the user to extract the binary tree topology and “manually” traverse the tree as it is for a list.

Nodes can be inserted into a tree with `rb_insert()` and removed with `rb_remove()`. Access to the “first” and “last” nodes within a tree (in the sense of the order defined by the comparison function) is provided by `rb_get_min()` and `rb_get_max()`. There is also a predicate, `rb_contains()`, which returns a boolean `True` if the provided node pointer exists as an element within the tree. As described above, all of these routines are guaranteed to have at most  $\log$  time complexity in the size of the tree.

There are two mechanisms provided for enumerating all elements in an `rbtree`. The first, `rb_walk()`, is a simple callback implementation where the caller specifies a C function pointer and an untyped argument to be passed to it, and the tree code calls that function for each node in order. This has the advantage of a very simple implementation, at the cost of a somewhat more cumbersome API for the user (not unlike ISO C’s `bsearch()` routine). It is a recursive implementation, however, and is thus not always available in environments that forbid the use of unbounded stack techniques like recursion.

There is also a `RB_FOR_EACH` iterator provided, which, like the similar APIs for the lists, works to iterate over a list in a more natural way, using a nested code block instead of a callback. It is also nonrecursive, though it requires  $\log$ -sized space on the stack by default (however, this can be configured to use a fixed/maximally size buffer instead where needed to avoid the dynamic allocation). As with the lists, this is also available in a `RB_FOR_EACH_CONTAINER` variant which enumerates using a pointer to a container field and not the raw node pointer.

## Tree Internals

As described, the Zephyr rbtree implementation is a conventional red/black tree as described pervasively in academic sources. Low level details about the algorithm are out of scope for this document, as they match existing conventions. This discussion will be limited to details notable or specific to the Zephyr implementation.

The core invariant guaranteed by the tree is that the path from the root of the tree to any leaf is no more than twice as long as the path to any other leaf. This is achieved by associating one bit of “color” with each node, either red or black, and enforcing a rule that no red child can be a child of another red child (i.e. that the number of black nodes on any path to the root must be the same, and that no more than that number of “extra” red nodes may be present). This rule is enforced by a set of rotation rules used to “fix” trees following modification.

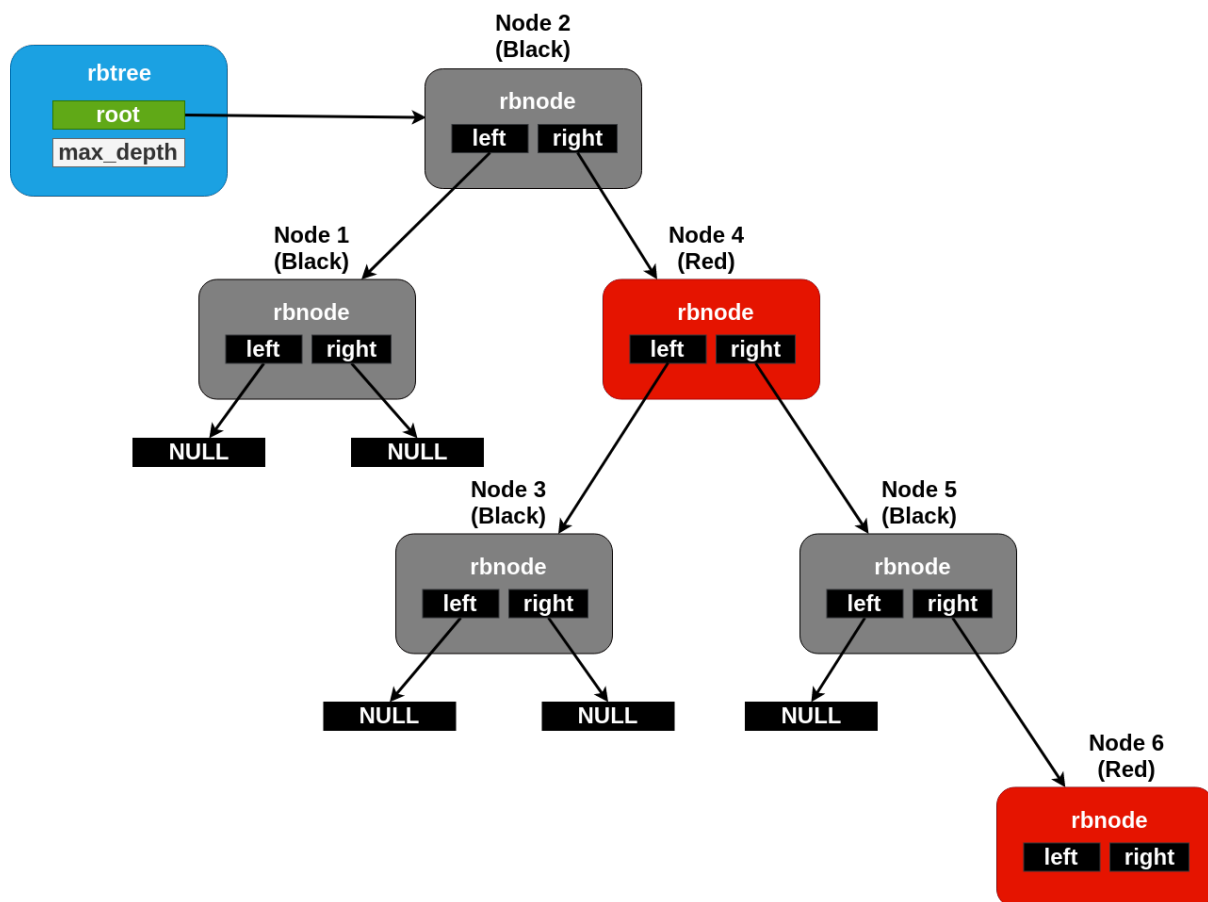

Fig. 8: A maximally unbalanced rbtree with a black height of two. No more nodes can be added underneath the rightmost node without rebalancing.

These rotations are conceptually implemented on top of a primitive that “swaps” the position of one node with another in the list. Typical implementations effect this by simply swapping the nodes internal “data” pointers, but because the Zephyr rbnode is intrusive, that cannot work. Zephyr must include somewhat more elaborate code to handle the edge cases (for example, one swapped node can be the root, or the two may already be parent/child).

The rbnode struct for a Zephyr rbtree contains only two pointers, representing the “left”, and “right” children of a node within the binary tree. Traversal of a tree for rebalancing following modification, however, routinely requires the ability to iterate “upwards” from a node as well. It is very common for red/black trees in the industry to store a third “parent” pointer for this purpose. Zephyr avoids this requirement by building a “stack” of node pointers locally as it traverses downward through the tree and updating it appropriately as modifications are made. So a Zephyr rbtree can be implemented with no more runtime storage overhead than a dlist.

These properties, of a balanced tree data structure that works with only two pointers of data per node and that works without any need for a memory allocation API, are quite rare in the industry and are somewhat unique to Zephyr.

## Red/Black Tree API Reference

*group* rbtree\_apis

### Defines

`RB_FOR_EACH(tree, node)`

Walk a tree in-order without recursing.

While `rb_walk()` is very simple, recursing on the C stack can be clumsy for some purposes and on some architectures wastes significant memory in stack frames. This macro implements a non-recursive “foreach” loop that can iterate directly on the tree, at a moderate cost in code size.

Note that the resulting loop is not safe against modifications to the tree. Changes to the tree structure during the loop will produce incorrect results, as nodes may be skipped or duplicated. Unlike linked lists, no `_SAFE` variant exists.

Note also that the macro expands its arguments multiple times, so they should not be expressions with side effects.

#### Parameters

- `tree` – A pointer to a struct rbtree to walk
- `node` – The symbol name of a local struct rbnode\* variable to use as the iterator

`RB_FOR_EACH_CONTAINER(tree, node, field)`

Loop over rbtree with implicit container field logic.

As for `RB_FOR_EACH()`, but “node” can have an arbitrary type containing a struct rbnode.

#### Parameters

- `tree` – A pointer to a struct rbtree to walk
- `node` – The symbol name of a local iterator
- `field` – The field name of a struct rbnode inside node

### Typedefs

`typedef bool (*rb_less_than_t)(struct rbnode *a, struct rbnode *b)`

Red/black tree comparison predicate.

Compares the two nodes and returns true if node A is strictly less than B according to the tree’s sorting criteria, false otherwise.

Note that during insert, the new node being inserted will always be “A”, where “B” is the existing node within the tree against which it is being compared. This trait can be used (with care!) to implement “most/least recently added” semantics between nodes which would otherwise compare as equal.

`typedef void (*rb_visit_t)(struct rbnode *node, void *cookie)`

## Functions

void rb\_insert(struct *rbtree* \*tree, struct rbnode \*node)

Insert node into tree.

void rb\_remove(struct *rbtree* \*tree, struct rbnode \*node)

Remove node from tree.

static inline struct rbnode \*rb\_get\_min(struct *rbtree* \*tree)

Returns the lowest-sorted member of the tree.

static inline struct rbnode \*rb\_get\_max(struct *rbtree* \*tree)

Returns the highest-sorted member of the tree.

bool rb\_contains(struct *rbtree* \*tree, struct rbnode \*node)

Returns true if the given node is part of the tree.

Note that this does not internally dereference the node pointer (though the tree's less-than callback might!), it just tests it for equality with items in the tree. So it's feasible to use this to implement a "set" construct by simply testing the pointer value itself.

static inline void rb\_walk(struct *rbtree* \*tree, *rb\_visit\_t* visit\_fn, void \*cookie)

Walk/enumerate a rbtree.

Very simple recursive enumeration. Low code size, but requiring a separate function can be clumsy for the user and there is no way to break out of the loop early. See RB\_FOR\_EACH for an iterative implementation.

struct rbtree

*#include <rb.h>*

### 7.18.5 Ring Buffers

A *ring buffer* is a circular buffer, whose contents are stored in first-in-first-out order.

For circumstances where an application needs to implement asynchronous "streaming" copying of data, Zephyr provides a struct *ring\_buf* abstraction to manage copies of such data in and out of a shared buffer of memory.

Two content data modes are supported:

- **Data item mode:** Multiple 32-bit word data items with metadata can be enqueued and dequeued from the ring buffer in chunks of up to 1020 bytes. Each data item also has two associated metadata values: a type identifier and a 16-bit integer value, both of which are application-specific.
- **Byte mode:** raw bytes can be enqueued and dequeued.

While the underlying data structure is the same, it is not legal to mix these two modes on a single ring buffer instance. A ring buffer initialized with a byte count must be used only with the "bytes" API, one initialized with a word count must use the "items" calls.

## Concepts

Any number of ring buffers can be defined (limited only by available RAM). Each ring buffer is referenced by its memory address.

A ring buffer has the following key properties:

- A **data buffer** of 32-bit words or bytes. The data buffer contains the data items or raw bytes that have been added to the ring buffer but not yet removed.
- A **data buffer size**, measured in 32-bit words or bytes. This governs the maximum amount of data (including metadata values) the ring buffer can hold.

A ring buffer must be initialized before it can be used. This sets its data buffer to empty.

A struct `ring_buf` may be placed anywhere in user-accessible memory, and must be initialized with `ring_buf_init()` before use. This must be provided a region of user-controlled memory for use as the buffer itself. Note carefully that the units of the size of the buffer passed change (either bytes or words) depending on how the ring buffer will be used later. Macros for combining these steps in a single static declaration exist for convenience. `RING_BUF_DECLARE` will declare and statically initialize a ring buffer with a specified byte count, where `RING_BUF_ITEM_DECLARE_SIZE` will declare and statically initialize a buffer with a given count of 32 bit words. `RING_BUF_ITEM_DECLARE_POW2` can be used to initialize an items-mode buffer with a memory region guaranteed to be a power of two, which enables various optimizations internal to the implementation. No power-of-two initialization is available for bytes-mode ring buffers.

“Bytes” data may be copied into the ring buffer using `ring_buf_put()`, passing a data pointer and byte count. These bytes will be copied into the buffer in order, as many as will fit in the allocated buffer. The total number of bytes copied (which may be fewer than provided) will be returned. Likewise `ring_buf_get()` will copy bytes out of the ring buffer in the order that they were written, into a user-provided buffer, returning the number of bytes that were transferred.

To avoid multiply-copied-data situations, a “claim” API exists for byte mode. `ring_buf_put_claim()` takes a byte size value from the user and returns a pointer to memory internal to the ring buffer that can be used to receive those bytes, along with a size of the contiguous internal region (which may be smaller than requested). The user can then copy data into that region at a later time without assembling all the bytes in a single region first. When complete, `ring_buf_put_finish()` can be used to signal the buffer that the transfer is complete, passing the number of bytes actually transferred. At this point a new transfer can be initiated. Similarly, `ring_buf_get_claim()` returns a pointer to internal ring buffer data from which the user can read without making a verbatim copy, and `ring_buf_get_finish()` signals the buffer with how many bytes have been consumed and allows for a new transfer to begin.

“Items” mode works similarly to bytes mode, except that all transfers are in units of 32 bit words and all memory is assumed to be aligned on 32 bit boundaries. The write and read operations are `ring_buf_item_put()` and `ring_buf_item_get()`, and work otherwise identically to the bytes mode APIs. There no “claim” API provided for items mode. One important difference is that unlike `ring_buf_put()`, `ring_buf_item_put()` will not do a partial transfer; it will return an error in the case where the provided data does not fit in its entirety.

The user can manage the capacity of a ring buffer without modifying it using the `ring_buf_space_get()` call (which returns a value of either bytes or items depending on how the ring buffer has been used), or by testing the `ring_buf_is_empty()` predicate.

Finally, a `ring_buf_reset()` call exists to immediately empty a ring buffer, discarding the tracking of any bytes or items already written to the buffer. It does not modify the memory contents of the buffer itself, however.

**Data item mode** A **data item mode** ring buffer instance is declared using `RING_BUF_ITEM_DECLARE_POW2()` or `RING_BUF_ITEM_DECLARE_SIZE()` and accessed using `ring_buf_item_put()` and `ring_buf_item_get()`.

A ring buffer **data item** is an array of 32-bit words from 0 to 1020 bytes in length. When a data item is **enqueued** (`ring_buf_item_put()`) its contents are copied to the data buffer, along with its associated metadata values (which occupy one additional 32-bit word). If the ring buffer has insufficient space to hold the new data item the enqueue operation fails.

A data item is **dequeued** (`ring_buf_item_get()`) from a ring buffer by removing the oldest enqueued item. The contents of the dequeued data item, as well as its two metadata values, are copied to areas supplied by the retriever. If the ring buffer is empty, or if the data array supplied by the retriever is not large enough to hold the data item's data, the dequeue operation fails.

**Byte mode** A **byte mode** ring buffer instance is declared using `RING_BUF_ITEM_DECLARE_SIZE()` and accessed using: `ring_buf_put_claim()`, `ring_buf_put_finish()`, `ring_buf_get_claim()`, `ring_buf_get_finish()`, `ring_buf_put()` and `ring_buf_get()`.

Data can be copied into the ring buffer (see `ring_buf_put()`) or ring buffer memory can be used directly by the user. In the latter case, the operation is split into three stages:

1. allocating the buffer (`ring_buf_put_claim()`) when user requests the destination location where data can be written.
2. writing the data by the user (e.g. buffer written by DMA).
3. indicating the amount of data written to the provided buffer (`ring_buf_put_finish()`). The amount can be less than or equal to the allocated amount.

Data can be retrieved from a ring buffer through copying (see `ring_buf_get()`) or accessed directly by address. In the latter case, the operation is split into three stages:

1. retrieving source location with valid data written to a ring buffer (see `ring_buf_get_claim()`).
2. processing data
3. freeing processed data (see `ring_buf_get_finish()`). The amount freed can be less than or equal to the retrieved amount.

**Concurrency** The ring buffer APIs do not provide any concurrency control. Depending on usage (particularly with respect to number of concurrent readers/writers) applications may need to protect the ring buffer with mutexes and/or use semaphores to notify consumers that there is data to read.

For the trivial case of one producer and one consumer, concurrency shouldn't be needed.

**Internal Operation** If the size of the data buffer is a power of two, the ring buffer uses efficient masking operations instead of expensive modulo operations when enqueueing and dequeuing data items. This option is applicable only for data item mode.

Data streamed through a ring buffer is always written to the next byte within the buffer, wrapping around to the first element after reaching the end, thus the "ring" structure. Internally, the `struct ring_buf` contains its own buffer pointer and its size, and also a "head" and "tail" index representing where the next read and write

This boundary is invisible to the user using the normal put/get APIs, but becomes a barrier to the "claim" API, because obviously no contiguous region can be returned that crosses the end of the buffer. This can

be surprising to application code, and produce performance artifacts when transfers need to alias closely to the size of the buffer, as the number of calls to claim/finish need to double for such transfers.

When running in items mode (only), the ring buffer contains two implementations for the modular arithmetic required to compute “next element” offsets. One is used for arbitrary sized buffers, but the other is optimized for power of two sizes and can replace the compare and subtract steps with a simple bitmask in several places, at the cost of testing the “mask” value for each call.

## Implementation

**Defining a Ring Buffer** A ring buffer is defined using a variable of type `ring_buf`. It must then be initialized by calling `ring_buf_init()`.

The following code defines and initializes an empty **data item mode** ring buffer (which is part of a larger data structure). The ring buffer’s data buffer is capable of holding 64 words of data and metadata information.

```
#define MY_RING_BUF_SIZE 64

struct my_struct {
    struct ring_buf rb;
    uint32_t buffer[MY_RING_BUF_SIZE];
    ...
};
struct my_struct ms;

void init_my_struct {
    ring_buf_init(&ms.rb, sizeof(ms.buffer), ms.buffer);
    ...
}
```

Alternatively, a ring buffer can be defined and initialized at compile time using one of two macros at file scope. Each macro defines both the ring buffer itself and its data buffer.

The following code defines a ring buffer with a power-of-two sized data buffer, which can be accessed using efficient masking operations.

```
/* Buffer with 2^8 (or 256) words */
RING_BUF_ITEM_DECLARE_POW2(my_ring_buf, 8);
```

The following code defines an application-specific sized **byte mode** ring buffer enqueued and dequeued as raw bytes:

```
#define MY_RING_BUF_WORDS 93
RING_BUF_ITEM_DECLARE_SIZE(my_ring_buf, MY_RING_BUF_WORDS);
```

The following code defines a ring buffer with an arbitrary-sized data buffer, which can be accessed using less efficient modulo operations. Ring buffer is intended to be used for raw bytes.

```
#define MY_RING_BUF_BYTES 93
RING_BUF_DECLARE_SIZE(my_ring_buf, MY_RING_BUF_BYTES);
```

**Enqueuing Data** A data item is added to a ring buffer by calling `ring_buf_item_put()`.

```
uint32_t data[MY_DATA_WORDS];
int ret;

ret = ring_buf_item_put(&ring_buf, TYPE_F00, 0, data, SIZE32_OF(data));
```

(continues on next page)

(continued from previous page)

```
if (ret == -EMSGSIZE) {
    /* not enough room for the data item */
    ...
}
```

If the data item requires only the type or application-specific integer value (i.e. it has no data array), a size of 0 and data pointer of NULL can be specified.

```
int ret;

ret = ring_buf_item_put(&ring_buf, TYPE_BAR, 17, NULL, 0);
if (ret == -EMSGSIZE) {
    /* not enough room for the data item */
    ...
}
```

Bytes are copied to a **byte mode** ring buffer by calling `ring_buf_put()`.

```
uint8_t my_data[MY_RING_BUF_BYTES];
uint32_t ret;

ret = ring_buf_put(&ring_buf, my_data, SIZE_OF(my_data));
if (ret != SIZE_OF(my_data)) {
    /* not enough room, partial copy. */
    ...
}
```

Data can be added to a **byte mode** ring buffer by directly accessing the ring buffer's memory. For example:

```
uint32_t size;
uint32_t rx_size;
uint8_t *data;
int err;

/* Allocate buffer within a ring buffer memory. */
size = ring_buf_put_claim(&ring_buf, &data, MY_RING_BUF_BYTES);

/* Work directly on a ring buffer memory. */
rx_size = uart_rx(data, size);

/* Indicate amount of valid data. rx_size can be equal or less than size. */
err = ring_buf_put_finish(&ring_buf, rx_size);
if (err != 0) {
    /* No space to put requested amount of data to ring buffer. */
    ...
}
```

**Retrieving Data** A data item is removed from a ring buffer by calling `ring_buf_item_get()`.

```
uint32_t my_data[MY_DATA_WORDS];
uint16_t my_type;
uint8_t my_value;
uint8_t my_size;
int ret;
```

(continues on next page)

(continued from previous page)

```

my_size = SIZE32_OF(my_data);
ret = ring_buf_item_get(&ring_buf, &my_type, &my_value, my_data, &my_size);
if (ret == -EMSGSIZE) {
    printk("Buffer is too small, need %d uint32_t\n", my_size);
} else if (ret == -EAGAIN) {
    printk("Ring buffer is empty\n");
} else {
    printk("Got item of type %u value &u of size %u dwords\n",
          my_type, my_value, my_size);
    ...
}

```

Data bytes are copied out from a **byte mode** ring buffer by calling `ring_buf_get()`. For example:

```

uint8_t my_data[MY_DATA_BYTES];
size_t ret;

ret = ring_buf_get(&ring_buf, my_data, sizeof(my_data));
if (ret != sizeof(my_data)) {
    /* Less bytes copied. */
} else {
    /* Requested amount of bytes retrieved. */
    ...
}

```

Data can be retrieved from a **byte mode** ring buffer by direct operations on the ring buffer's memory. For example:

```

uint32_t size;
uint32_t proc_size;
uint8_t *data;
int err;

/* Get buffer within a ring buffer memory. */
size = ring_buf_get_claim(&ring_buf, &data, MY_RING_BUF_BYTES);

/* Work directly on a ring buffer memory. */
proc_size = process(data, size);

/* Indicate amount of data that can be freed. proc_size can be equal or less
 * than size.
 */
err = ring_buf_get_finish(&ring_buf, proc_size);
if (err != 0) {
    /* proc_size exceeds amount of valid data in a ring buffer. */
    ...
}

```

## Configuration Options

Related configuration options:

- `:kconfig: CONFIG_RING_BUFFER`: Enable ring buffer.

## API Reference

The following ring buffer APIs are provided by `include/sys/ring_buffer.h`:

*group* ring\_buffer\_apis

### Defines

`RING_BUF_ITEM_DECLARE_POW2(name, pow)`

Define and initialize a high performance ring buffer.

This macro establishes a ring buffer whose size must be a power of 2; that is, the ring buffer contains  $2^{\text{pow}}$  32-bit words, where *pow* is the specified ring buffer size exponent. A high performance ring buffer doesn't require the use of modulo arithmetic operations to maintain itself.

The ring buffer can be accessed outside the module where it is defined using:

```
extern struct ring_buf <name>;
```

#### Parameters

- *name* – Name of the ring buffer.
- *pow* – Ring buffer size exponent.

`RING_BUF_ITEM_DECLARE_SIZE(name, size32)`

Define and initialize a standard ring buffer.

This macro establishes a ring buffer of an arbitrary size. A standard ring buffer uses modulo arithmetic operations to maintain itself.

The ring buffer can be accessed outside the module where it is defined using:

```
extern struct ring_buf <name>;
```

#### Parameters

- *name* – Name of the ring buffer.
- *size32* – Size of ring buffer (in 32-bit words).

`RING_BUF_DECLARE(name, size8)`

Define and initialize a ring buffer for byte data.

This macro establishes a ring buffer of an arbitrary size.

The ring buffer can be accessed outside the module where it is defined using:

```
extern struct ring_buf <name>;
```

#### Parameters

- *name* – Name of the ring buffer.
- *size8* – Size of ring buffer (in bytes).

## Functions

static inline void ring\_buf\_init (struct ring\_buf \*buf, uint32\_t size, void \*data)

Initialize a ring buffer.

This routine initializes a ring buffer, prior to its first use. It is only used for ring buffers not defined using RING\_BUF\_DECLARE, RING\_BUF\_ITEM\_DECLARE\_POW2 or RING\_BUF\_ITEM\_DECLARE\_SIZE.

Setting *size* to a power of 2 establishes a high performance ring buffer that doesn't require the use of modulo arithmetic operations to maintain itself.

### Parameters

- buf – Address of ring buffer.
- size – Ring buffer size (in 32-bit words or bytes).
- data – Ring buffer data area (uint32\_t data[size] or uint8\_t data[size] for bytes mode).

int ring\_buf\_is\_empty (struct ring\_buf \*buf)

Determine if a ring buffer is empty.

### Parameters

- buf – Address of ring buffer.

**Returns** 1 if the ring buffer is empty, or 0 if not.

static inline void ring\_buf\_reset (struct ring\_buf \*buf)

Reset ring buffer state.

### Parameters

- buf – Address of ring buffer.

uint32\_t ring\_buf\_space\_get (struct ring\_buf \*buf)

Determine free space in a ring buffer.

### Parameters

- buf – Address of ring buffer.

**Returns** Ring buffer free space (in 32-bit words or bytes).

static inline uint32\_t ring\_buf\_capacity\_get (struct ring\_buf \*buf)

Return ring buffer capacity.

### Parameters

- buf – Address of ring buffer.

**Returns** Ring buffer capacity (in 32-bit words or bytes).

uint32\_t ring\_buf\_size\_get (struct ring\_buf \*buf)

Determine used space in a ring buffer.

### Parameters

- buf – Address of ring buffer.

**Returns** Ring buffer space used (in 32-bit words or bytes).

int ring\_buf\_item\_put (struct ring\_buf \*buf, uint16\_t type, uint8\_t value, uint32\_t \*data, uint8\_t size32)

Write a data item to a ring buffer.

This routine writes a data item to ring buffer *buf*. The data item is an array of 32-bit words (from zero to 1020 bytes in length), coupled with a 16-bit type identifier and an 8-bit integer value.

**Warning:** Use cases involving multiple writers to the ring buffer must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the ring buffer.

#### Parameters

- *buf* – Address of ring buffer.
- *type* – Data item's type identifier (application specific).
- *value* – Data item's integer value (application specific).
- *data* – Address of data item.
- *size32* – Data item size (number of 32-bit words).

#### Return values

- 0 – Data item was written.
- -EMSGSIZE – Ring buffer has insufficient free space.

```
int ring_buf_item_get(struct ring_buf *buf, uint16_t *type, uint8_t *value, uint32_t *data,
                    uint8_t *size32)
```

Read a data item from a ring buffer.

This routine reads a data item from ring buffer *buf*. The data item is an array of 32-bit words (up to 1020 bytes in length), coupled with a 16-bit type identifier and an 8-bit integer value.

**Warning:** Use cases involving multiple reads of the ring buffer must prevent concurrent read operations, either by preventing all readers from being preempted or by using a mutex to govern reads to the ring buffer.

#### Parameters

- *buf* – Address of ring buffer.
- *type* – Area to store the data item's type identifier.
- *value* – Area to store the data item's integer value.
- *data* – Area to store the data item. Can be NULL to discard data.
- *size32* – Size of the data item storage area (number of 32-bit chunks).

#### Return values

- 0 – Data item was fetched; *size32* now contains the number of 32-bit words read into data area *data*.
- -EAGAIN – Ring buffer is empty.
- -EMSGSIZE – Data area *data* is too small; *size32* now contains the number of 32-bit words needed.

```
uint32_t ring_buf_put_claim(struct ring_buf *buf, uint8_t **data, uint32_t size)
```

Allocate buffer for writing data to a ring buffer.

With this routine, memory copying can be reduced since internal ring buffer can be used directly by the user. Once data is written to allocated area number of bytes written can be confirmed (see [ring\\_buf\\_put\\_finish](#)).

**Warning:** Use cases involving multiple writers to the ring buffer must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item access (calls prefixed with `ring_buf_item_`).

#### Parameters

- `buf` – [in] Address of ring buffer.
- `data` – [out] Pointer to the address. It is set to a location within ring buffer.
- `size` – [in] Requested allocation size (in bytes).

**Returns** Size of allocated buffer which can be smaller than requested if there is not enough free space or buffer wraps.

```
int ring_buf_put_finish(struct ring_buf *buf, uint32_t size)
```

Indicate number of bytes written to allocated buffers.

**Warning:** Use cases involving multiple writers to the ring buffer must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item access (calls prefixed with `ring_buf_item_`).

#### Parameters

- `buf` – Address of ring buffer.
- `size` – Number of valid bytes in the allocated buffers.

#### Return values

- 0 – Successful operation.
- -EINVAL – Provided *size* exceeds free space in the ring buffer.

```
uint32_t ring_buf_put(struct ring_buf *buf, const uint8_t *data, uint32_t size)
```

Write (copy) data to a ring buffer.

This routine writes data to a ring buffer *buf*.

**Warning:** Use cases involving multiple writers to the ring buffer must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item access (calls prefixed with `ring_buf_item_`).

#### Parameters

- `buf` – Address of ring buffer.
- `data` – Address of data.
- `size` – Data size (in bytes).

**Return values** Number – of bytes written.

```
uint32_t ring_buf_get_claim(struct ring_buf *buf, uint8_t **data, uint32_t size)
```

Get address of a valid data in a ring buffer.

With this routine, memory copying can be reduced since internal ring buffer can be used directly by the user. Once data is processed it can be freed using [ring\\_buf\\_get\\_finish](#).

**Warning:** Use cases involving multiple reads of the ring buffer must prevent concurrent read operations, either by preventing all readers from being preempted or by using a mutex to govern reads to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item access (calls prefixed with `ring_buf_item_`).

#### Parameters

- `buf` – **[in]** Address of ring buffer.
- `data` – **[out]** Pointer to the address. It is set to a location within ring buffer.
- `size` – **[in]** Requested size (in bytes).

**Returns** Number of valid bytes in the provided buffer which can be smaller than requested if there is not enough free space or buffer wraps.

```
int ring_buf_get_finish(struct ring_buf *buf, uint32_t size)
```

Indicate number of bytes read from claimed buffer.

**Warning:** Use cases involving multiple reads of the ring buffer must prevent concurrent read operations, either by preventing all readers from being preempted or by using a mutex to govern reads to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item mode (calls prefixed with `ring_buf_item_`).

#### Parameters

- `buf` – Address of ring buffer.
- `size` – Number of bytes that can be freed.

#### Return values

- 0 – Successful operation.

- `-EINVAL` – Provided *size* exceeds valid bytes in the ring buffer.

`uint32_t ring_buf_get(struct ring_buf *buf, uint8_t *data, uint32_t size)`

Read data from a ring buffer.

This routine reads data from a ring buffer *buf*.

**Warning:** Use cases involving multiple reads of the ring buffer must prevent concurrent read operations, either by preventing all readers from being preempted or by using a mutex to govern reads to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item mode (calls prefixed with `ring_buf_item_`).

#### Parameters

- *buf* – Address of ring buffer.
- *data* – Address of the output buffer. Can be `NULL` to discard data.
- *size* – Data size (in bytes).

**Return values** Number – of bytes written to the output buffer.

`uint32_t ring_buf_peek(struct ring_buf *buf, uint8_t *data, uint32_t size)`

Peek at data from a ring buffer.

This routine reads data from a ring buffer *buf* without removal.

**Warning:** Use cases involving multiple reads of the ring buffer must prevent concurrent read operations, either by preventing all readers from being preempted or by using a mutex to govern reads to the ring buffer.

**Warning:** Ring buffer instance should not mix byte access and item mode (calls prefixed with `ring_buf_item_`).

**Warning:** Multiple calls to peek will result in the same data being ‘peeked’ multiple times. To remove data, use either [ring\\_buf\\_get](#) or [ring\\_buf\\_get\\_claim](#) followed by [ring\\_buf\\_get\\_finish](#) with a non-zero size.

#### Parameters

- *buf* – Address of ring buffer.
- *data* – Address of the output buffer. Cannot be `NULL`.
- *size* – Data size (in bytes).

**Return values** Number – of bytes written to the output buffer.

## 7.19 MODBUS

Modbus is an industrial messaging protocol. The protocol is specified for different types of networks or buses. Zephyr OS implementation supports communication over serial line and may be used with different physical interfaces, like RS485 or RS232. TCP support is not implemented directly, but there are helper functions to realize TCP support according to the application's needs.

Modbus communication is based on client/server model. Only one client may be present on the bus. Client can communicate with several server devices. Server devices themselves are passive and must not send requests or unsolicited responses. Services requested by the client are specified by function codes (FCxx), and can be found in the specification or documentation of the API below.

Zephyr RTOS implementation supports both client and server roles.

More information about Modbus and Modbus RTU can be found on the website [MODBUS Protocol Specifications](#).

### 7.19.1 Samples

`modbus-rtu-server-sample` and `modbus-rtu-client-sample` give the possibility to try out RTU server and RTU client implementation with an evaluation board.

`modbus-tcp-server-sample` is a simple Modbus TCP server.

`modbus-gateway-sample` is an example how to build a TCP to serial line gateway with Zephyr OS.

### 7.19.2 API Reference

*group* modbus

MODBUS transport protocol API.

#### Defines

MODBUS\_MBAP\_LENGTH

Length of MBAP Header

MODBUS\_MBAP\_AND\_FC\_LENGTH

Length of MBAP Header plus function code

#### Typedefs

`typedef int (*modbus_raw_cb_t)(const int iface, const struct modbus_adu *adu)`

ADU raw callback function signature.

**Param** *iface* Modbus RTU interface index

**Param** *adu* Pointer to the RAW ADU struct to send

**Retval** 0 If transfer was successful

## Enums

enum modbus\_mode

Modbus interface mode.

*Values:*

enumerator MODBUS\_MODE\_RTU

Modbus over serial line RTU mode

enumerator MODBUS\_MODE\_ASCII

Modbus over serial line ASCII mode

enumerator MODBUS\_MODE\_RAW

Modbus raw ADU mode

## Functions

int modbus\_read\_coils(const int iface, const uint8\_t unit\_id, const uint16\_t start\_addr, uint8\_t \*const coil\_tbl, const uint16\_t num\_coils)

Coil read (FC01)

Sends a Modbus message to read the status of coils from a server.

### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Coil starting address
- `coil_tbl` – Pointer to an array of bytes containing the value of the coils read. The format is:

	MSB								LSB
	B7	B6	B5	B4	B3	B2	B1	B0	
<code>coil_tbl[0]</code>	<i>#8</i>	<i>#7</i>							<i>#1</i>
<code>coil_tbl[1]</code>	<i>#16</i>	<i>#15</i>							<i>#9</i>
:									
:									

Note that the array that will be receiving the coil values must be greater than or equal to:  $(\text{num\_coils} - 1) / 8 + 1$

- `num_coils` – Quantity of coils to read

**Return values** 0 – If the function was successful

int modbus\_read\_dinputs(const int iface, const uint8\_t unit\_id, const uint16\_t start\_addr, uint8\_t \*const di\_tbl, const uint16\_t num\_di)

Read discrete inputs (FC02)

Sends a Modbus message to read the status of discrete inputs from a server.

### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server

- `start_addr` – Discrete input starting address
- `di_tbl` – Pointer to an array that will receive the state of the discrete inputs. The format of the array is as follows:

	MSB					LSB			
	B7	B6	B5	B4	B3	B2	B1	B0	
	-----								
<code>di_tbl[0]</code>	<i>#8</i>	<i>#7</i>							<i>#1</i>
<code>di_tbl[1]</code>	<i>#16</i>	<i>#15</i>							<i>#9</i>
<code>:</code>									
<code>:</code>									

Note that the array that will be receiving the discrete input values must be greater than or equal to:  $(\text{num\_di} - 1) / 8 + 1$

- `num_di` – Quantity of discrete inputs to read

**Return values** 0 – If the function was successful

```
int modbus_read_holding_regs(const int iface, const uint8_t unit_id, const uint16_t start_addr,
                             uint16_t *const reg_buf, const uint16_t num_regs)
```

Read holding registers (FC03)

Sends a Modbus message to read the value of holding registers from a server.

#### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current values of the holding registers from the server. The array pointed to by ‘`reg_buf`’ needs to be able to hold at least ‘`num_regs`’ entries.
- `num_regs` – Quantity of registers to read

**Return values** 0 – If the function was successful

```
int modbus_read_input_regs(const int iface, const uint8_t unit_id, const uint16_t start_addr,
                            uint16_t *const reg_buf, const uint16_t num_regs)
```

Read input registers (FC04)

Sends a Modbus message to read the value of input registers from a server.

#### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current value of the holding registers from the server. The array pointed to by ‘`reg_buf`’ needs to be able to hold at least ‘`num_regs`’ entries.
- `num_regs` – Quantity of registers to read

**Return values** 0 – If the function was successful

```
int modbus_write_coil(const int iface, const uint8_t unit_id, const uint16_t coil_addr, const bool
                      coil_state)
```

Write single coil (FC05)

Sends a Modbus message to write the value of single coil to a server.

**Parameters**

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `coil_addr` – Coils starting address
- `coil_state` – Is the desired state of the coil

**Return values** 0 – If the function was successful

```
int modbus_write_holding_reg(const int iface, const uint8_t unit_id, const uint16_t start_addr,
                           const uint16_t reg_val)
```

Write single holding register (FC06)

Sends a Modbus message to write the value of single holding register to a server unit.

**Parameters**

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Coils starting address
- `reg_val` – Desired value of the holding register

**Return values** 0 – If the function was successful

```
int modbus_request_diagnostic(const int iface, const uint8_t unit_id, const uint16_t sfunc,
                             const uint16_t data, uint16_t *const data_out)
```

Read diagnostic (FC08)

Sends a Modbus message to perform a diagnostic function of a server unit.

**Parameters**

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `sfunc` – Diagnostic sub-function code
- `data` – Sub-function data
- `data_out` – Pointer to the data value

**Return values** 0 – If the function was successful

```
int modbus_write_coils(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint8_t
                      *const coil_tbl, const uint16_t num_coils)
```

Write coils (FC15)

Sends a Modbus message to write to coils on a server unit.

**Parameters**

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Coils starting address
- `coil_tbl` – Pointer to an array of bytes containing the value of the coils to write. The format is:

	MSB							LSB
	B7	B6	B5	B4	B3	B2	B1	B0
<code>coil_tbl[0]</code>	<i>#8</i>	<i>#7</i>						<i>#1</i>

(continues on next page)

(continued from previous page)

```
coil_tbl[1]      #16  #15                                #9
:
:
```

Note that the array that will be receiving the coil values must be greater than or equal to:  $(\text{num\_coils} - 1) / 8 + 1$

- `num_coils` – Quantity of coils to write

**Return values** 0 – If the function was successful

```
int modbus_write_holding_regs(const int iface, const uint8_t unit_id, const uint16_t start_addr,
                             uint16_t *const reg_buf, const uint16_t num_regs)
```

Write holding registers (FC16)

Sends a Modbus message to write to integer holding registers to a server unit.

#### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array containing the value of the holding registers to write. Note that the array containing the register values must be greater than or equal to ‘`num_regs`’
- `num_regs` – Quantity of registers to write

**Return values** 0 – If the function was successful

```
int modbus_read_holding_regs_fp(const int iface, const uint8_t unit_id, const uint16_t
                               start_addr, float *const reg_buf, const uint16_t num_regs)
```

Read floating-point holding registers (FC03)

Sends a Modbus message to read the value of floating-point holding registers from a server unit.

#### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current values of the holding registers from the server. The array pointed to by ‘`reg_buf`’ needs to be able to hold at least ‘`num_regs`’ entries.
- `num_regs` – Quantity of registers to read

**Return values** 0 – If the function was successful

```
int modbus_write_holding_regs_fp(const int iface, const uint8_t unit_id, const uint16_t
                                 start_addr, float *const reg_buf, const uint16_t num_regs)
```

Write floating-point holding registers (FC16)

Sends a Modbus message to write to floating-point holding registers to a server unit.

#### Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address

- `reg_buf` – Is a pointer to an array containing the value of the holding registers to write. Note that the array containing the register values must be greater than or equal to ‘`num_regs`’
- `num_regs` – Quantity of registers to write

**Return values** 0 – If the function was successful

`int modbus_iface_get_by_name(const char *iface_name)`

Get Modbus interface index according to interface name.

If there is more than one interface, it can be used to clearly identify interfaces in the application.

#### Parameters

- `iface_name` – Modbus interface name

**Return values** Modbus – interface index or negative error value.

`int modbus_init_server(const int iface, struct modbus\_iface\_param param)`

Configure Modbus Interface as raw ADU server.

#### Parameters

- `iface` – Modbus RTU interface index
- `param` – Configuration parameter of the server interface

**Return values** 0 – If the function was successful

`int modbus_init_client(const int iface, struct modbus\_iface\_param param)`

Configure Modbus Interface as raw ADU client.

#### Parameters

- `iface` – Modbus RTU interface index
- `param` – Configuration parameter of the client interface

**Return values** 0 – If the function was successful

`int modbus_disable(const uint8_t iface)`

Disable Modbus Interface.

This function is called to disable Modbus interface.

#### Parameters

- `iface` – Modbus interface index

**Return values** 0 – If the function was successful

`int modbus_raw_submit_rx(const int iface, const struct modbus\_adu *adu)`

Submit raw ADU.

#### Parameters

- `iface` – Modbus RTU interface index
- `adu` – Pointer to the RAW ADU struct that is received

**Return values** 0 – If transfer was successful

`void modbus_raw_put_header(const struct modbus\_adu *adu, uint8_t *header)`

Put MBAP header into a buffer.

#### Parameters

- `adu` – Pointer to the RAW ADU struct
- `header` – Pointer to the buffer in which MBAP header will be placed.

**Return values** 0 – If transfer was successful

```
void modbus_raw_get_header(struct modbus_adu *adu, const uint8_t *header)
```

Get MBAP header from a buffer.

**Parameters**

- *adu* – Pointer to the RAW ADU struct
- *header* – Pointer to the buffer containing MBAP header

**Return values** 0 – If transfer was successful

```
void modbus_raw_set_server_failure(struct modbus_adu *adu)
```

Set Server Device Failure exception.

This function modifies ADU passed by the pointer.

**Parameters**

- *adu* – Pointer to the RAW ADU struct

```
int modbus_raw_backend_txn(const int iface, struct modbus_adu *adu)
```

Use interface as backend to send and receive ADU.

This function overwrites ADU passed by the pointer and generates exception responses if backend interface is misconfigured or target device is unreachable.

**Parameters**

- *iface* – Modbus client interface index
- *adu* – Pointer to the RAW ADU struct

**Return values** 0 – If transfer was successful

```
struct modbus_adu
```

*#include <modbus.h>* Frame struct used internally and for raw ADU support.

## Public Members

```
uint16_t trans_id
```

Transaction Identifier

```
uint16_t proto_id
```

Protocol Identifier

```
uint16_t length
```

Length of the data only (not the length of unit ID + PDU)

```
uint8_t unit_id
```

Unit Identifier

```
uint8_t fc
```

Function Code

```
uint8_t data[CONFIG_MODBUS_BUFFER_SIZE - 4]
```

Transaction Data

```
uint16_t crc
    RTU CRC
```

```
struct modbus_user_callbacks
    #include <modbus.h> Modbus Server User Callback structure
```

### Public Members

```
int (*coil_rd)(uint16_t addr, bool *state)
    Coil read callback

int (*coil_wr)(uint16_t addr, bool state)
    Coil write callback

int (*discrete_input_rd)(uint16_t addr, bool *state)
    Discrete Input read callback

int (*input_reg_rd)(uint16_t addr, uint16_t *reg)
    Input Register read callback

int (*input_reg_rd_fp)(uint16_t addr, float *reg)
    Floating Point Input Register read callback

int (*holding_reg_rd)(uint16_t addr, uint16_t *reg)
    Holding Register read callback

int (*holding_reg_wr)(uint16_t addr, uint16_t reg)
    Holding Register write callback

int (*holding_reg_rd_fp)(uint16_t addr, float *reg)
    Floating Point Holding Register read callback

int (*holding_reg_wr_fp)(uint16_t addr, float reg)
    Floating Point Holding Register write callback
```

```
struct modbus_serial_param
    #include <modbus.h> Modbus serial line parameter.
```

### Public Members

```
uint32_t baud
    Baudrate of the serial line

enum uart\_config\_parity parity
    parity UART's parity setting:  UART_CFG_PARITY_NONE, UART_CFG_PARITY_EVEN,
    UART_CFG_PARITY_ODD
```

```
struct modbus_server_param
    #include <modbus.h> Modbus server parameter.
```

### Public Members

```
struct modbus_user_callbacks *user_cb
    Pointer to the User Callback structure
```

```
uint8_t unit_id
    Modbus unit ID of the server
```

```
struct modbus_iface_param
    #include <modbus.h> User parameter structure to configure Modbus interfase as client or
    server.
```

### Public Members

```
enum modbus_mode mode
    Mode of the interface
```

```
uint32_t rx_timeout
    Amount of time client will wait for a response from the server.
```

```
struct modbus_serial_param serial
    Serial support parameter of the interface
```

```
modbus_raw_cb_t raw_tx_cb
    Pointer to raw ADU callback function
```

## 7.20 Networking

### 7.20.1 Network APIs

#### BSD Sockets

- [Overview](#)
- [Secure Sockets](#)
  - [TLS credentials subsystem](#)
  - [Secure Socket Creation](#)
  - [Secure Sockets options](#)
- [API Reference](#)
  - [BSD Sockets](#)
  - [TLS Credentials](#)

**Overview** Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespaced by default, to avoid name conflicts with well-known names like `close()`, which may be part of `libc` or other POSIX compatibility libraries. If enabled by `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES``, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using `:kconfig: `CONFIG_NET_SOCKETS`` config option and implements the following operations: `socket()`, `close()`, `recv()`, `recvfrom()`, `send()`, `sendto()`, `connect()`, `bind()`, `listen()`, `accept()`, `fcntl()` (to set non-blocking mode), `getsockopt()`, `setsockopt()`, `poll()`, `select()`, `getaddrinfo()`, `getnameinfo()`.

Based on the namespacing requirements above, these operations are by default exposed as functions with `zsock_` prefix, e.g. `zsock_socket()` and `zsock_close()`. If the config option `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like `close()` and `fcntl()` (which may conflict with functions in `libc` or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on `SOCK_STREAM` type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like `stdin/stdout`), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, `stdin/stdout`) is not enabled.

**Secure Sockets** Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by `mbedtls` library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See `net_ip_protocol_secure` type for supported secure protocol versions.

To enable secure sockets, set the `:kconfig: `CONFIG_NET_SOCKETS_SOCKOPT_TLS`` option. To enable DTLS support, use `:kconfig: `CONFIG_NET_SOCKETS_ENABLE_DTLS`` option.

**TLS credentials subsystem** TLS credentials must be registered in the system before they can be used with secure sockets. See `tls_credential_add()` for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type `sec_tag_t`, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- `TLS_CREDENTIAL_CA_CERTIFICATE`
- `TLS_CREDENTIAL_SERVER_CERTIFICATE`
- `TLS_CREDENTIAL_PRIVATE_KEY`
- `TLS_CREDENTIAL_PSK`
- `TLS_CREDENTIAL_PSK_ID`

An example registration of CA certificate (provided in `ca_certificate` array) looks like this:

```
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE,
                        ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

**Secure Socket Creation** A secure socket can be created by specifying secure protocol type, for instance:

```
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```
sec_tag_t sec_tag_opt[] = {
    CA_CERTIFICATE_TAG,
};

ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST,
                sec_tag_opt, sizeof(sec_tag_opt));
```

```
char host[] = "google.com";

ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host) - 1);
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

**Secure Sockets options** Secure sockets offer the following options for socket management:

*group* secure\_sockets\_options

## Defines

### TLS\_SEC\_TAG\_LIST

Socket option to select TLS credentials to use. It accepts and returns an array of `sec_tag_t` that indicate which TLS credentials should be used with specific socket.

### TLS\_HOSTNAME

Write-only socket option to set hostname. It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

### TLS\_CIPHERSUITE\_LIST

Socket option to select ciphersuites to use. It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedtls default behavior).

### TLS\_CIPHERSUITE\_USED

Read-only socket option to read a ciphersuite chosen during TLS handshake. It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

**TLS\_PEER\_VERIFY**

Write-only socket option to set peer verification level for TLS connection. This option accepts an integer with a peer verification level, compatible with mbedTLS values:

- 0 - none
- 1 - optional
- 2 - required

If not set, socket will use mbedTLS defaults (none for servers, required for clients).

**TLS\_DTLS\_ROLE**

Write-only socket option to set role for DTLS connection. This option is irrelevant for TLS connections, as for them role is selected based on connect()/listen() usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:

- 0 - client
- 1 - server

**TLS\_ALPN\_LIST**

Socket option for setting the supported Application Layer Protocols. It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

**TLS\_DTLS\_HANDSHAKE\_TIMEOUT\_MIN**

Socket option to set DTLS handshake timeout. The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.

**TLS\_DTLS\_HANDSHAKE\_TIMEOUT\_MAX**

**API Reference** Note that current socket API implementation is not thread safe and caller should not do socket operations to same socket from multiple threads unless protected by a mutex, semaphore or similar.

**BSD Sockets**

*group* `bsd_sockets`

BSD Sockets compatible API.

**Defines****ZSOCK\_POLLIN**

`zsock_poll`: Poll for readability

**ZSOCK\_POLLPRI**

`zsock_poll`: Compatibility value, ignored

**ZSOCK\_POLLOUT**

`zsock_poll`: Poll for writability

ZSOCK\_POLLERR

zsock\_poll: Poll results in error condition (output value only)

ZSOCK\_POLLHUP

zsock\_poll: Poll detected closed connection (output value only)

ZSOCK\_POLLNVAL

zsock\_poll: Invalid socket (output value only)

ZSOCK\_MSG\_PEEK

zsock\_recv: Read data without removing it from socket input queue

ZSOCK\_MSG\_TRUNC

zsock\_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK\_MSG\_DONTWAIT

zsock\_recv/zsock\_send: Override operation to non-blocking

ZSOCK\_MSG\_WAITALL

zsock\_recv: block until the full amount of data can be returned

ZSOCK\_SHUT\_RD

zsock\_shutdown: Shut down for reading

ZSOCK\_SHUT\_WR

zsock\_shutdown: Shut down for writing

ZSOCK\_SHUT\_RDWR

zsock\_shutdown: Shut down for both reading and writing

SOL\_TLS

Protocol level for TLS. Here, the same socket protocol level for TLS as in Linux was used.

TLS\_PEER\_VERIFY\_NONE

Peer verification disabled.

TLS\_PEER\_VERIFY\_OPTIONAL

Peer verification optional.

TLS\_PEER\_VERIFY\_REQUIRED

Peer verification required.

TLS\_DTLS\_ROLE\_CLIENT

Client role in a DTLS session.

TLS\_DTLS\_ROLE\_SERVER

Server role in a DTLS session.

AI\_PASSIVE

Address for bind() (vs for connect())

AI\_CANONNAME

Fill in ai\_canonname

AI\_NUMERICHOST

Assume host address is in numeric notation, don't DNS lookup

AI\_V4MAPPED

May return IPv4 mapped address for IPv6

AI\_ALL

May return both native IPv6 and mapped IPv4 address for IPv6

AI\_ADDRCONFIG

IPv4/IPv6 support depends on local system config

AI\_NUMERICSERV

Assume service (port) is numeric

NI\_NUMERICHOST

[\*zsock\\_getnameinfo\(\)\*](#): Resolve to numeric address.

NI\_NUMERICSERV

[\*zsock\\_getnameinfo\(\)\*](#): Resolve to numeric port number.

NI\_NOFQDN

[\*zsock\\_getnameinfo\(\)\*](#): Return only hostname instead of FQDN

NI\_NAMEREQD

[\*zsock\\_getnameinfo\(\)\*](#): Dummy option for compatibility

NI\_DGRAM

[\*zsock\\_getnameinfo\(\)\*](#): Dummy option for compatibility

NI\_MAXHOST

[\*zsock\\_getnameinfo\(\)\*](#): Max supported hostname length

IFNAMSIZ

SOL\_SOCKET

sockopt: Socket-level option

SO\_REUSEADDR

sockopt: Enable server address reuse (ignored, for compatibility)

SO\_TYPE

sockopt: Type of the socket

SO\_ERROR

sockopt: Async error (ignored, for compatibility)

SO\_RCVTIMEO

sockopt: Receive timeout Applies to receive functions like `recv()`, but not to `connect()`

SO\_SNDTIMEO

sockopt: Send timeout

SO\_BINDTODEVICE

sockopt: Bind a socket to an interface

SO\_TIMESTAMPING

sockopt: Timestamp TX packets

SO\_PROTOCOL

sockopt: Protocol used with the socket

TCP\_NODELAY

sockopt: Disable TCP buffering (ignored, for compatibility)

IPV6\_V6ONLY

sockopt: Don't support IPv4 access (ignored, for compatibility)

SO\_PRIORITY

sockopt: Socket priority

SO\_TXTIME

sockopt: Socket TX time (when the data should be sent)

SCM\_TXTIME

SO\_SOCKS5

sockopt: Enable SOCKS5 for Socket

ZSOCK\_FD\_SETSIZE

Number of file descriptors which can be added to [`zsock\_fd\_set`](#)

## Typedefs

typedef struct [`zsock\_fd\_set`](#) zsock\_fd\_set

## Functions

```
void *zsock_get_context_object(int sock)
```

Obtain a file descriptor's associated net context.

With `CONFIG_USERSPACE` enabled, the kernel's object permission system must apply to socket file descriptors. When a socket is opened, by default only the caller has permission, access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object associated with a network socket file descriptor with `'__net_socket'`. All pointers to instances of these will be known to the kernel as kernel objects with type `K_OBJ_NET_SOCKET`.

This API is intended for threads that need to grant access to the object associated with a particular file descriptor to another thread. The returned pointer represents the underlying `K_OBJ_NET_SOCKET` and may be passed to APIs like [k\\_object\\_access\\_grant\(\)](#).

In a system like Linux which has the notion of threads running in processes in a shared virtual address space, this sort of management is unnecessary as the scope of file descriptors is implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to implement a process-like model due to the lack of memory virtualization hardware. They use discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access its memory; the pointer can only be used to make permission assignment calls, which follow exactly the rules for other kernel objects like device drivers and IPC.

#### Parameters

- `sock` – file descriptor

**Returns** pointer to associated network socket object, or `NULL` if the file descriptor wasn't valid or the caller had no access permission

```
int zsock_socket(int family, int type, int proto)
```

Create a network socket.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `socket()` if **:kconfig:** `'CONFIG_NET_SOCKETS_POSIX_NAMES'` is defined.

If `CONFIG_USERSPACE` is enabled, the caller will be granted access to the context object associated with the returned file descriptor.

#### See also:

[zsock\\_get\\_context\\_object\(\)](#)

```
int zsock_socketpair(int family, int type, int proto, int *sv)
```

Create an unnamed pair of connected sockets.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `socketpair()` if **:kconfig:** `'CONFIG_NET_SOCKETS_POSIX_NAMES'` is defined.

```
int zsock_close(int sock)
```

Close a network socket.

Close a network socket. This function is also exposed as `close()` if **:kconfig:** `'CONFIG_NET_SOCKETS_POSIX_NAMES'` is defined (in which case it may conflict with generic POSIX `close()` function).

`int zsock_shutdown(int sock, int how)`

Shutdown socket send/receive operations.

See [POSIX.1-2017 article](#) for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as `shutdown()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_bind(int sock, const struct sockaddr *addr, socklen\_t addrlen)`

Bind a socket to a local network address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `bind()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_connect(int sock, const struct sockaddr *addr, socklen\_t addrlen)`

Connect a socket to a peer network address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `connect()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_listen(int sock, int backlog)`

Set up a STREAM socket to accept peer connections.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `listen()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_accept(int sock, struct sockaddr *addr, socklen\_t *addrlen)`

Accept a connection on listening socket.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `accept()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen\_t addrlen)`

Send data to an arbitrary network address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `sendto()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)`

Send data to a connected peer.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `send()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)`  
Send data to an arbitrary network address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `sendmsg()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)`  
Receive data from an arbitrary network address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `recvfrom()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)`  
Receive data from a connected peer.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `recv()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_fcntl(int sock, int cmd, int flags)`  
Control blocking/non-blocking mode of a socket.

This functions allow to (only) configure a socket for blocking or non-blocking operation (`O_NONBLOCK`). This function is also exposed as `fcntl()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined (in which case it may conflict with generic POSIX `fcntl()` function).

`int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)`  
Efficiently poll multiple sockets for events.

See [POSIX.1-2017 article](#) for normative description. (In Zephyr this function works only with sockets, not arbitrary file descriptors.) This function is also exposed as `poll()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined (in which case it may conflict with generic POSIX `poll()` function).

`int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)`  
Get various socket options.

See [POSIX.1-2017 article](#) for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as `getsockopt()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen\_t optlen)`  
Set various socket options.

See [POSIX.1-2017 article](#) for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as `setsockopt()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_getsockname(int sock, struct sockaddr *addr, socklen\_t *addrlen)`  
Get socket name.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `getsockname()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_gethostname(char *buf, size_t len)`  
Get local host name.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `gethostname()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`static inline char *zsock_inet_ntop(sa\_family\_t family, const void *src, char *dst, size_t size)`  
Convert network address from internal to numeric ASCII form.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `inet_ntop()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_inet_pton(sa\_family\_t family, const char *src, void *dst)`  
Convert network address from numeric ASCII form to internal representation.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `inet_pton()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_getaddrinfo(const char *host, const char *service, const struct zsock\_addrinfo *hints, struct zsock\_addrinfo **res)`  
Resolve a domain name to one or more network addresses.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `getaddrinfo()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`void zsock_freeaddrinfo(struct zsock\_addrinfo *ai)`  
Free results returned by `zsock_getaddrinfo()`

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `freeaddrinfo()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`const char *zsock_gai_strerror(int errcode)`

Convert `zsock_getaddrinfo()` error code to textual message.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `gai_strerror()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)`

Resolve a network address to a domain name or ASCII address.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `getnameinfo()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)`

Legacy function to poll multiple sockets for events.

See [POSIX.1-2017 article](#) for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use `zsock_poll()` instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as `select()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined (in which case it may conflict with generic POSIX `select()` function).

`void ZSOCK_FD_ZERO(zsock_fd_set *set)`

Initialize (clear) `fd_set`.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `FD_ZERO()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)`

Check whether socket is a member of `fd_set`.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `FD_ISSET()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

`void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)`

Remove socket from `fd_set`.

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `FD_CLR()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

```
void ZSOCK_FD_SET(int fd, zsock_fd_set *set)
    Add socket to fd_set.
```

See [POSIX.1-2017 article](#) for normative description. This function is also exposed as `FD_SET()` if `:kconfig: `CONFIG_NET_SOCKETS_POSIX_NAMES`` is defined.

```
struct zsock_pollfd
    #include <socket.h>

struct zsock_addrinfo
    #include <socket.h>

struct ifreq
    #include <socket.h> Interface description structure

struct zsock_fd_set
    #include <socket_select.h>

struct zsock_timeval
    #include <socket_types.h>
```

## TLS Credentials

```
group tls_credentials
    TLS credentials management.
```

## Typedefs

```
typedef int sec_tag_t
    Secure tag, a reference to TLS credential
    Secure tag can be used to reference credential after it was registered in the system.
```

---

**Note:** Some TLS credentials come in pairs:

- `TLS_CREDENTIAL_SERVER_CERTIFICATE` with `TLS_CREDENTIAL_PRIVATE_KEY`,
  - `TLS_CREDENTIAL_PSK` with `TLS_CREDENTIAL_PSK_ID`. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.
- 

## Enums

```
enum tls_credential_type
    TLS credential types
    Values:
```

enumerator TLS\_CREDENTIAL\_NONE

Unspecified credential.

enumerator TLS\_CREDENTIAL\_CA\_CERTIFICATE

A trusted CA certificate. Use this to authenticate remote servers. Used with certificate-based ciphersuites.

enumerator TLS\_CREDENTIAL\_SERVER\_CERTIFICATE

A public server certificate. Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.

enumerator TLS\_CREDENTIAL\_PRIVATE\_KEY

Private key. Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

enumerator TLS\_CREDENTIAL\_PSK

Pre-shared key. Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.

enumerator TLS\_CREDENTIAL\_PSK\_ID

Pre-shared key identity. Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

## Functions

int `tls_credential_add`([sec\\_tag\\_t](#) tag, enum [tls\\_credential\\_type](#) type, const void \*cred, size\_t credlen)

Add a TLS credential.

This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

### Parameters

- tag – A security tag that credential will be referenced with.
- type – A TLS/DTLS credential type.
- cred – A TLS/DTLS credential.
- credlen – A TLS/DTLS credential length.

### Return values

- 0 – TLS credential successfully added.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOMEM – Not enough memory to add new TLS credential.
- -EEXIST – TLS credential of specific tag and type already exists.

int `tls_credential_get`([sec\\_tag\\_t](#) tag, enum [tls\\_credential\\_type](#) type, void \*cred, size\_t \*credlen)

Get a TLS credential.

This function gets an already registered TLS credential, referenced by tag secure tag of type.

### Parameters

- tag – A security tag of requested credential.

- `type` – A TLS/DTLS credential type of requested credential.
- `cred` – A buffer for TLS/DTLS credential.
- `credlen` – A buffer size on input. TLS/DTLS credential length on output.

**Return values**

- 0 – TLS credential successfully obtained.
- `-EACCES` – Access to the TLS credential subsystem was denied.
- `-ENOENT` – Requested TLS credential was not found.
- `-EFBIG` – Requested TLS credential does not fit in the buffer provided.

`int tls_credential_delete(sec_tag_t tag, enum tls\_credential\_type type)`

Delete a TLS credential.

This function removes a TLS credential, referenced by `tag` secure tag of type.

**Parameters**

- `tag` – A security tag corresponding to removed credential.
- `type` – A TLS/DTLS credential type of removed credential.

**Return values**

- 0 – TLS credential successfully deleted.
- `-EACCES` – Access to the TLS credential subsystem was denied.
- `-ENOENT` – Requested TLS credential was not found.

## IPv4/IPv6 Primitives and Helpers

- [Overview](#)
  - [API Reference](#)

**Overview** Miscellaneous defines and helper functions for IP addresses and IP protocols.

### API Reference

*group* `ip_4_6`

IPv4/IPv6 primitives and helpers.

**Defines**

`PF_UNSPEC`

Unspecified protocol family.

`PF_INET`

IP protocol family version 4.

`PF_INET6`

IP protocol family version 6.

PF\_PACKET

Packet family.

PF\_CAN

Controller Area Network.

PF\_NET\_MGMT

Network management info.

PF\_LOCAL

Inter-process communication

PF\_UNIX

Inter-process communication

AF\_UNSPEC

Unspecified address family.

AF\_INET

IP protocol family version 4.

AF\_INET6

IP protocol family version 6.

AF\_PACKET

Packet family.

AF\_CAN

Controller Area Network.

AF\_NET\_MGMT

Network management info.

AF\_LOCAL

Inter-process communication

AF\_UNIX

Inter-process communication

ntohs(x)

Convert 16-bit value from network to host byte order.

**Parameters**

- x – The network byte order value to convert.

**Returns** Host byte order value.

ntohl(x)

Convert 32-bit value from network to host byte order.

**Parameters**

- x – The network byte order value to convert.

**Returns** Host byte order value.

`ntohl1(x)`

Convert 64-bit value from network to host byte order.

**Parameters**

- `x` – The network byte order value to convert.

**Returns** Host byte order value.

`htons(x)`

Convert 16-bit value from host to network byte order.

**Parameters**

- `x` – The host byte order value to convert.

**Returns** Network byte order value.

`htonl(x)`

Convert 32-bit value from host to network byte order.

**Parameters**

- `x` – The host byte order value to convert.

**Returns** Network byte order value.

`htonll(x)`

Convert 64-bit value from host to network byte order.

**Parameters**

- `x` – The host byte order value to convert.

**Returns** Network byte order value.

`ALIGN_H(x)`

`ALIGN_D(x)`

`CMSG_FIRSTHDR(msghdr)`

`CMSG_NXTHDR(msghdr, cmsg)`

`CMSG_DATA(cmsg)`

`CMSG_SPACE(length)`

`CMSG_LEN(length)`

`INET_ADDRSTRLEN`

Max length of the IPv4 address as a string. Defined by POSIX.

`INET6_ADDRSTRLEN`

Max length of the IPv6 address as a string. Takes into account possible mapped IPv4 addresses.

`NET_MAX_PRIORITIES`

`net_ipaddr_copy(dest, src)`

Copy an IPv4 or IPv6 address.

**Parameters**

- `dest` – Destination IP address.

- `src` – Source IP address.

**Returns** Destination address.

## Typedefs

`typedef unsigned short int sa_family_t`  
Socket address family type

`typedef size_t socklen_t`  
Length of a socket address

## Enums

`enum net_ip_protocol`  
Protocol numbers from IANA/BSD

*Values:*

enumerator `IPPROTO_IP` = 0  
IP protocol (pseudo-val for `setsockopt()`)

enumerator `IPPROTO_ICMP` = 1  
ICMP protocol

enumerator `IPPROTO_IGMP` = 2  
IGMP protocol

enumerator `IPPROTO_IPIP` = 4  
IPIP tunnels

enumerator `IPPROTO_TCP` = 6  
TCP protocol

enumerator `IPPROTO_UDP` = 17  
UDP protocol

enumerator `IPPROTO_IPV6` = 41  
IPv6 protocol

enumerator `IPPROTO_ICMPV6` = 58  
ICMPv6 protocol

enumerator `IPPROTO_RAW` = 255  
RAW IP packets

`enum net_ip_protocol_secure`  
Protocol numbers for TLS protocols

*Values:*

enumerator IPPROTO\_TLS\_1\_0 = 256

TLS 1.0 protocol

enumerator IPPROTO\_TLS\_1\_1 = 257

TLS 1.1 protocol

enumerator IPPROTO\_TLS\_1\_2 = 258

TLS 1.2 protocol

enumerator IPPROTO\_DTLS\_1\_0 = 272

DTLS 1.0 protocol

enumerator IPPROTO\_DTLS\_1\_2 = 273

DTLS 1.2 protocol

enum net\_sock\_type

Socket type

*Values:*

enumerator SOCK\_STREAM = 1

Stream socket type

enumerator SOCK\_DGRAM

Datagram socket type

enumerator SOCK\_RAW

RAW socket type

enum net\_ip\_mtu

*Values:*

enumerator NET\_IPV6\_MTU = 1280

IPv6 MTU length. We must be able to receive this size IPv6 packet without fragmentation.

enumerator NET\_IPV4\_MTU = 576

IPv4 MTU length. We must be able to receive this size IPv4 packet without fragmentation.

enum net\_priority

Network packet priority settings described in IEEE 802.1Q Annex I.1

*Values:*

enumerator NET\_PRIORITY\_BK = 1

Background (lowest)

enumerator NET\_PRIORITY\_BE = 0

Best effort (default)

enumerator NET\_PRIORITY\_EE = 2

Excellent effort

enumerator NET\_PRIORITY\_CA = 3

Critical applications (highest)

enumerator NET\_PRIORITY\_VI = 4

Video, < 100 ms latency and jitter

enumerator NET\_PRIORITY\_VO = 5

Voice, < 10 ms latency and jitter

enumerator NET\_PRIORITY\_IC = 6

Internetwork control

enumerator NET\_PRIORITY\_NC = 7

Network control

enum net\_addr\_state

What is the current state of the network address

*Values:*

enumerator NET\_ADDR\_ANY\_STATE = -1

Default (invalid) address type

enumerator NET\_ADDR\_TENTATIVE = 0

Tentative address

enumerator NET\_ADDR\_PREFERRED

Preferred address

enumerator NET\_ADDR\_DEPRECATED

Deprecated address

enum net\_addr\_type

How the network address is assigned to network interface

*Values:*

enumerator NET\_ADDR\_ANY = 0

Default value. This is not a valid value.

enumerator NET\_ADDR\_AUTOCONF

Auto configured address

enumerator NET\_ADDR\_DHCP

Address is from DHCP

enumerator NET\_ADDR\_MANUAL

Manually set address

enumerator NET\_ADDR\_OVERRIDABLE

Manually set address which is overridable by DHCP

## Functions

static inline bool net\_ipv6\_is\_addr\_loopback(struct *in6\_addr* \*addr)

Check if the IPv6 address is a loopback address (::1).

### Parameters

- addr – IPv6 address

**Returns** True if address is a loopback address, False otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast(const struct *in6\_addr* \*addr)

Check if the IPv6 address is a multicast address.

### Parameters

- addr – IPv6 address

**Returns** True if address is multicast address, False otherwise.

struct *net\_if\_addr* \*net\_if\_ipv6\_addr\_lookup(const struct *in6\_addr* \*addr, struct *net\_if* \*\*iface)

static inline bool net\_ipv6\_is\_my\_addr(struct *in6\_addr* \*addr)

Check if IPv6 address is found in one of the network interfaces.

### Parameters

- addr – IPv6 address

**Returns** True if address was found, False otherwise.

struct *net\_if\_mcast\_addr* \*net\_if\_ipv6\_maddr\_lookup(const struct *in6\_addr* \*addr, struct *net\_if* \*\*iface)

static inline bool net\_ipv6\_is\_my\_maddr(struct *in6\_addr* \*maddr)

Check if IPv6 multicast address is found in one of the network interfaces.

### Parameters

- maddr – Multicast IPv6 address

**Returns** True if address was found, False otherwise.

static inline bool net\_ipv6\_is\_prefix(const uint8\_t \*addr1, const uint8\_t \*addr2, uint8\_t length)

Check if two IPv6 addresses are same when compared after prefix mask.

### Parameters

- addr1 – First IPv6 address.
- addr2 – Second IPv6 address.
- length – Prefix length (max length is 128).

**Returns** True if IPv6 prefixes are the same, False otherwise.

```
static inline bool net_ipv4_is_addr_loopback(struct in_addr *addr)
```

Check if the IPv4 address is a loopback address (127.0.0.0/8).

**Parameters**

- `addr` – IPv4 address

**Returns** True if address is a loopback address, False otherwise.

```
static inline bool net_ipv4_is_addr_unspecified(const struct in_addr *addr)
```

Check if the IPv4 address is unspecified (all bits zero)

**Parameters**

- `addr` – IPv4 address.

**Returns** True if the address is unspecified, false otherwise.

```
static inline bool net_ipv4_is_addr_mcast(const struct in_addr *addr)
```

Check if the IPv4 address is a multicast address.

**Parameters**

- `addr` – IPv4 address

**Returns** True if address is multicast address, False otherwise.

```
static inline bool net_ipv4_is_ll_addr(const struct in_addr *addr)
```

Check if the given IPv4 address is a link local address.

**Parameters**

- `addr` – A valid pointer on an IPv4 address

**Returns** True if it is, false otherwise.

```
static inline bool net_ipv4_addr_cmp(const struct in_addr *addr1, const struct in_addr *addr2)
```

Compare two IPv4 addresses.

**Parameters**

- `addr1` – Pointer to IPv4 address.
- `addr2` – Pointer to IPv4 address.

**Returns** True if the addresses are the same, false otherwise.

```
static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
```

Compare two IPv6 addresses.

**Parameters**

- `addr1` – Pointer to IPv6 address.
- `addr2` – Pointer to IPv6 address.

**Returns** True if the addresses are the same, false otherwise.

```
static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
```

Check if the given IPv6 address is a link local address.

**Parameters**

- `addr` – A valid pointer on an IPv6 address

**Returns** True if it is, false otherwise.

```
static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
```

Check if the given IPv6 address is a unique local address.

**Parameters**

- `addr` – A valid pointer on an IPv6 address

**Returns** True if it is, false otherwise.

```
const struct in6_addr *net_ipv6_unspecified_address(void)
```

Return pointer to any (all bits zeros) IPv6 address.

**Returns** Any IPv6 address.

```
const struct in_addr *net_ipv4_unspecified_address(void)
```

Return pointer to any (all bits zeros) IPv4 address.

**Returns** Any IPv4 address.

```
const struct in_addr *net_ipv4_broadcast_address(void)
```

Return pointer to broadcast (all bits ones) IPv4 address.

**Returns** Broadcast IPv4 address.

```
bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
```

```
static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
```

Check if the given address belongs to same subnet that has been configured for the interface.

**Parameters**

- `iface` – A valid pointer on an interface
- `addr` – IPv4 address

**Returns** True if address is in same subnet, false otherwise.

```
bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
```

```
static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
```

Check if the given IPv4 address is a broadcast address.

**Parameters**

- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr` – IPv4 address

**Returns** True if address is a broadcast address, false otherwise.

```
struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
```

```
static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)
```

Check if the IPv4 address is assigned to any network interface in the system.

**Parameters**

- `addr` – A valid pointer on an IPv4 address

**Returns** True if IPv4 address is found in one of the network interfaces, False otherwise.

```
static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)
```

Check if the IPv6 address is unspecified (all bits zero)

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is unspecified, false otherwise.

static inline bool net\_ipv6\_is\_addr\_solicited\_node(const struct [in6\\_addr](#) \*addr)

Check if the IPv6 address is solicited node multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is solicited node address, false otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast\_scope(const struct [in6\\_addr](#) \*addr, int scope)

Check if the IPv6 address is a given scope multicast address (FFyx::).

**Parameters**

- `addr` – IPv6 address
- `scope` – Scope to check

**Returns** True if the address is in given scope multicast address, false otherwise.

static inline bool net\_ipv6\_is\_same\_mcast\_scope(const struct [in6\\_addr](#) \*addr\_1, const struct [in6\\_addr](#) \*addr\_2)

Check if the IPv6 addresses have the same multicast scope (FFyx::).

**Parameters**

- `addr_1` – IPv6 address 1
- `addr_2` – IPv6 address 2

**Returns** True if both addresses have same multicast scope, false otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast\_global(const struct [in6\\_addr](#) \*addr)

Check if the IPv6 address is a global multicast address (FFxE::/16).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is global multicast address, false otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast\_iface(const struct [in6\\_addr](#) \*addr)

Check if the IPv6 address is a interface scope multicast address (FFx1::).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a interface scope multicast address, false otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast\_link(const struct [in6\\_addr](#) \*addr)

Check if the IPv6 address is a link local scope multicast address (FFx2::).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a link local scope multicast address, false otherwise.

static inline bool net\_ipv6\_is\_addr\_mcast\_mesh(const struct [in6\\_addr](#) \*addr)

Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a mesh-local scope multicast address, false otherwise.

```
static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)
```

Check if the IPv6 address is a site scope multicast address (FFx5::).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a site scope multicast address, false otherwise.

```
static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)
```

Check if the IPv6 address is an organization scope multicast address (FFx8::).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is an organization scope multicast address, false otherwise.

```
static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)
```

Check if the IPv6 address belongs to certain multicast group.

**Parameters**

- `addr` – IPv6 address.
- `group` – Group id IPv6 address, the values must be in network byte order

**Returns** True if the IPv6 multicast address belongs to given multicast group, false otherwise.

```
static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)
```

Check if the IPv6 address belongs to the all nodes multicast group.

**Parameters**

- `addr` – IPv6 address

**Returns** True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise

```
static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)
```

Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a interface scope all nodes multicast address, false otherwise.

```
static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)
```

Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

**Parameters**

- `addr` – IPv6 address.

**Returns** True if the address is a link local scope all nodes multicast address, false otherwise.

```
static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)
```

Create solicited node IPv6 multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

**Parameters**

- `src` – IPv6 address.

- `dst` – IPv6 address.

```
static inline void net_ipv6_addr_create(struct in6_addr *addr, uint16_t addr0, uint16_t addr1,  
                                       uint16_t addr2, uint16_t addr3, uint16_t addr4,  
                                       uint16_t addr5, uint16_t addr6, uint16_t addr7)
```

Construct an IPv6 address from eight 16-bit words.

#### Parameters

- `addr` – IPv6 address
- `addr0` – 16-bit word which is part of the address
- `addr1` – 16-bit word which is part of the address
- `addr2` – 16-bit word which is part of the address
- `addr3` – 16-bit word which is part of the address
- `addr4` – 16-bit word which is part of the address
- `addr5` – 16-bit word which is part of the address
- `addr6` – 16-bit word which is part of the address
- `addr7` – 16-bit word which is part of the address

```
static inline void net_ipv6_addr_create_ll_allnodes_mcast(struct in6_addr *addr)
```

Create link local allnodes multicast IPv6 address.

#### Parameters

- `addr` – IPv6 address

```
static inline void net_ipv6_addr_create_ll_allrouters_mcast(struct in6_addr *addr)
```

Create link local allrouters multicast IPv6 address.

#### Parameters

- `addr` – IPv6 address

```
static inline void net_ipv6_addr_create_iid(struct in6_addr *addr, struct net_linkaddr *lladdr)
```

Create IPv6 address interface identifier.

#### Parameters

- `addr` – IPv6 address
- `lladdr` – Link local address

```
static inline bool net_ipv6_addr_based_on_ll(const struct in6_addr *addr, const struct  
                                             net_linkaddr *lladdr)
```

Check if given address is based on link layer address.

**Returns** True if it is, False otherwise

```
static inline struct sockaddr_in6 *net_sin6(const struct sockaddr *addr)
```

Get *sockaddr\_in6* from *sockaddr*. This is a helper so that the code calling this function can be made shorter.

#### Parameters

- `addr` – Socket address

**Returns** Pointer to IPv6 socket address

```
static inline struct sockaddr_in *net_sin(const struct sockaddr *addr)
```

Get *sockaddr\_in* from *sockaddr*. This is a helper so that the code calling this function can be made shorter.

#### Parameters

- `addr` – Socket address

**Returns** Pointer to IPv4 socket address

static inline struct [sockaddr\\_in6\\_ptr](#) \*net\_sin6\_ptr(const struct sockaddr\_ptr \*addr)

Get [sockaddr\\_in6\\_ptr](#) from `sockaddr_ptr`. This is a helper so that the code calling this function can be made shorter.

**Parameters**

- `addr` – Socket address

**Returns** Pointer to IPv6 socket address

static inline struct [sockaddr\\_in\\_ptr](#) \*net\_sin\_ptr(const struct sockaddr\_ptr \*addr)

Get [sockaddr\\_in\\_ptr](#) from `sockaddr_ptr`. This is a helper so that the code calling this function can be made shorter.

**Parameters**

- `addr` – Socket address

**Returns** Pointer to IPv4 socket address

static inline struct [sockaddr\\_ll\\_ptr](#) \*net\_sll\_ptr(const struct sockaddr\_ptr \*addr)

Get [sockaddr\\_ll\\_ptr](#) from `sockaddr_ptr`. This is a helper so that the code calling this function can be made shorter.

**Parameters**

- `addr` – Socket address

**Returns** Pointer to linklayer socket address

static inline struct [sockaddr\\_can\\_ptr](#) \*net\_can\_ptr(const struct sockaddr\_ptr \*addr)

Get [sockaddr\\_can\\_ptr](#) from `sockaddr_ptr`. This is a helper so that the code needing this functionality can be made shorter.

**Parameters**

- `addr` – Socket address

**Returns** Pointer to CAN socket address

int net\_addr\_pton([sa\\_family\\_t](#) family, const char \*src, void \*dst)

Convert a string to IP address.

---

**Note:** This function doesn't do precise error checking, do not use for untrusted strings.

---

**Parameters**

- `family` – IP address family (AF\_INET or AF\_INET6)
- `src` – IP address in a null terminated string
- `dst` – Pointer to struct [in\\_addr](#) if family is AF\_INET or pointer to struct [in6\\_addr](#) if family is AF\_INET6

**Returns** 0 if ok, < 0 if error

char \*net\_addr\_ntop([sa\\_family\\_t](#) family, const void \*src, char \*dst, size\_t size)

Convert IP address to string form.

**Parameters**

- `family` – IP address family (AF\_INET or AF\_INET6)

- `src` – Pointer to struct [in\\_addr](#) if family is AF\_INET or pointer to struct [in6\\_addr](#) if family is AF\_INET6
- `dst` – Buffer for IP address as a null terminated string
- `size` – Number of bytes available in the buffer

**Returns** `dst` pointer if ok, NULL if error

`bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)`

Parse a string that contains either IPv4 or IPv6 address and optional port, and store the information in user supplied `sockaddr` struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42

[2001:db8::2] 2001:db::42 Note that the `str_len` parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in `sockaddr` is not modified.

#### Parameters

- `str` – String that contains the IP address.
- `str_len` – Length of the string to be parsed.
- `addr` – Pointer to user supplied struct `sockaddr`.

**Returns** True if parsing could be done, false otherwise.

`static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)`

Compare TCP sequence numbers.

This function compares TCP sequence numbers, accounting for wraparound effects.

#### Parameters

- `seq1` – First sequence number
- `seq2` – Second sequence number

**Returns** < 0 if `seq1` < `seq2`, 0 if `seq1` == `seq2`, > 0 if `seq1` > `seq2`

`static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)`

Check that one TCP sequence number is greater.

This is convenience function on top of [net\\_tcp\\_seq\\_cmp\(\)](#).

#### Parameters

- `seq1` – First sequence number
- `seq2` – Second sequence number

**Returns** True if `seq1` > `seq2`

`int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)`

Convert a string of hex values to array of bytes.

The syntax of the string is “ab:02:98:fa:42:01”

#### Parameters

- `buf` – Pointer to memory where the bytes are written.
- `buf_len` – Length of the memory area.
- `src` – String of bytes.

**Returns** 0 if ok, <0 if error

```
int net_tx_priority2tc(enum net\_priority prio)
```

Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

**Parameters**

- prio – Network priority

**Returns** Tx traffic class that handles that priority network traffic.

```
int net_rx_priority2tc(enum net\_priority prio)
```

Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

**Parameters**

- prio – Network priority

**Returns** Rx traffic class that handles that priority network traffic.

```
static inline enum net\_priority net_vlan2priority(uint8_t priority)
```

Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

**Parameters**

- priority – VLAN priority

**Returns** Network priority

```
static inline uint8_t net_priority2vlan(enum net\_priority priority)
```

Convert network packet priority to network packet VLAN priority.

**Parameters**

- priority – Packet priority

**Returns** VLAN priority (PCP)

```
const char *net_family2str(sa\_family\_t family)
```

Return network address family value as a string. This is only usable for debugging.

**Parameters**

- family – Network address family code

**Returns** Network address family as a string, or NULL if family is unknown.

```
struct in6_addr
```

*#include <net\_ip.h>* IPv6 address struct

```
struct in_addr
```

*#include <net\_ip.h>* IPv4 address struct

```
struct sockaddr_in6
```

*#include <net\_ip.h>* Socket address struct for IPv6.

```
struct sockaddr_in6_ptr
```

*#include <net\_ip.h>*

```
struct sockaddr_in
```

*#include <net\_ip.h>* Socket address struct for IPv4.

```
struct sockaddr_in_ptr
    #include <net_ip.h>

struct sockaddr_ll
    #include <net_ip.h> Socket address struct for packet socket.

struct sockaddr_ll_ptr
    #include <net_ip.h>

struct sockaddr_can_ptr
    #include <net_ip.h>

struct iovec
    #include <net_ip.h>

struct msghdr
    #include <net_ip.h>

struct cmsghdr
    #include <net_ip.h>

struct sockaddr
    #include <net_ip.h> Generic sockaddr struct. Must be cast to proper type.

struct net_tuple
    #include <net_ip.h> IPv6/IPv4 network connection tuple
```

### Public Members

```
struct net_addr *remote_addr
    IPv6/IPv4 remote address

struct net_addr *local_addr
    IPv6/IPv4 local address

uint16_t remote_port
    UDP/TCP remote port

uint16_t local_port
    UDP/TCP local port

enum net\_ip\_protocol ip_proto
    IP protocol
```

## DNS Resolve

- [Overview](#)
- [Sample usage](#)
- [API Reference](#)

**Overview** The DNS resolver implements a basic DNS resolver according to [IETF RFC1035 on Domain Implementation and Specification](#). Supported DNS answers are IPv4/IPv6 addresses and CNAME.

If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the `:kconfig: `CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES`` Kconfig variable.

The multicast DNS (mDNS) client resolver support can be enabled by setting `:kconfig: `CONFIG_MDNS_RESOLVER`` Kconfig option. See [IETF RFC6762](#) for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the `:kconfig: `CONFIG_LLMNR_RESOLVER`` Kconfig variable. See [IETF RFC4795](#) for more details about LLMNR.

For more information about DNS configuration variables, see: [subsys/net/lib/dns/Kconfig](#). The DNS resolver API can be found at [include/net/dns\\_resolve.h](#).

**Sample usage** See DNS resolve sample application for details.

## API Reference

group `dns_resolve`

DNS resolving library.

### Defines

`DNS_MAX_NAME_SIZE`

Max size of the resolved name.

### Typedefs

```
typedef void (*dns_resolve_cb_t)(enum dns\_resolve\_status status, struct dns\_addrinfo *info, void *user_data)
```

DNS resolve callback.

The DNS resolve callback is called after a successful DNS resolving. The resolver can call this callback multiple times, one for each resolved address.

**Param status** The status of the query: `DNS_EAI_INPROGRESS` returned for each resolved address `DNS_EAI_ALLDONE` mark end of the resolving, `info` is set to `NULL` in this case `DNS_EAI_CANCELED` if the query was canceled manually or timeout happened `DNS_EAI_FAIL` if the name cannot be resolved by the server `DNS_EAI_NODATA` if there is no such name other values means that an error happened.

**Param info** Query results are stored here.

**Param user\_data** The user data given in [dns\\_resolve\\_name\(\)](#) call.

## Enums

enum dns\_query\_type

DNS query type enum

*Values:*

enumerator DNS\_QUERY\_TYPE\_A = 1

IPv4 query

enumerator DNS\_QUERY\_TYPE\_AAAA = 28

IPv6 query

enum dns\_resolve\_status

Status values for the callback.

*Values:*

enumerator DNS\_EAI\_BADFLAGS = -1

Invalid value for ai\_flags field

enumerator DNS\_EAI\_NONAME = -2

NAME or SERVICE is unknown

enumerator DNS\_EAI\_AGAIN = -3

Temporary failure in name resolution

enumerator DNS\_EAI\_FAIL = -4

Non-recoverable failure in name res

enumerator DNS\_EAI\_NODATA = -5

No address associated with NAME

enumerator DNS\_EAI\_FAMILY = -6

ai\_family not supported

enumerator DNS\_EAI\_SOCKTYPE = -7

ai\_socktype not supported

enumerator DNS\_EAI\_SERVICE = -8

SRV not supported for ai\_socktype

enumerator DNS\_EAI\_ADDRFAMILY = -9

Address family for NAME not supported

enumerator DNS\_EAI\_MEMORY = -10

Memory allocation failure

enumerator DNS\_EAI\_SYSTEM = -11

System error returned in errno

enumerator DNS\_EAI\_OVERFLOW = -12

Argument buffer overflow

enumerator DNS\_EAI\_INPROGRESS = -100

Processing request in progress

enumerator DNS\_EAI\_CANCELED = -101

Request canceled

enumerator DNS\_EAI\_NOTCANCELED = -102

Request not canceled

enumerator DNS\_EAI\_ALLDONE = -103

All requests done

enumerator DNS\_EAI\_IDN\_ENCODE = -105

IDN encoding failed

enum dns\_resolve\_context\_state

*Values:*

enumerator DNS\_RESOLVE\_CONTEXT\_ACTIVE

enumerator DNS\_RESOLVE\_CONTEXT\_DEACTIVATING

enumerator DNS\_RESOLVE\_CONTEXT\_INACTIVE

## Functions

int dns\_resolve\_init(struct [dns\\_resolve\\_context](#) \*ctx, const char \*dns\_servers\_str[], const struct [sockaddr](#) \*dns\_servers\_sa[])

Init DNS resolving context.

This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as struct [sockaddr](#) (or both). Note that the recommended way to resolve DNS names is to use the [dns\\_get\\_addr\\_info\(\)](#) API. In that case user does not need to call [dns\\_resolve\\_init\(\)](#) as the DNS servers are already setup by the system.

### Parameters

- ctx – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.
- dns\_servers\_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
- dns\_servers\_sa – DNS server addresses as struct [sockaddr](#). The array is NULL terminated. Port numbers are optional in struct [sockaddr](#), the default will be used if set to 0.

**Returns** 0 if ok, <0 if error.

```
int dns_resolve_close(struct dns_resolve_context *ctx)
```

Close DNS resolving context.

This releases DNS resolving context and marks the context unusable. Caller must call the *dns\_resolve\_init()* again to make context usable.

#### Parameters

- ctx – DNS context

**Returns** 0 if ok, <0 if error.

```
int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[], const  
                           struct sockaddr *servers_sa[])
```

Reconfigure DNS resolving context.

Reconfigures DNS context with new server list.

#### Parameters

- ctx – DNS context
- servers\_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
- servers\_sa – DNS server addresses as struct *sockaddr*. The array is NULL terminated. Port numbers are optional in struct *sockaddr*, the default will be used if set to 0.

**Returns** 0 if ok, <0 if error.

```
int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)
```

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

#### Parameters

- ctx – DNS context
- dns\_id – DNS id of the pending query

**Returns** 0 if ok, <0 if error.

```
int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char  
                                *query_name, enum dns_query_type query_type)
```

Cancel a pending DNS query using id, name and type.

This releases DNS resources used by a pending query.

#### Parameters

- ctx – DNS context
- dns\_id – DNS id of the pending query
- query\_name – Name of the resource we are trying to query (hostname)
- query\_type – Type of the query (A or AAAA)

**Returns** 0 if ok, <0 if error.

```
int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type  
                    type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t  
                    timeout)
```

Resolve DNS name.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

#### Parameters

- `ctx` – DNS context
- `query` – What the caller wants to resolve.
- `type` – What kind of data the caller wants to get.
- `dns_id` – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- `cb` – Callback to call after the resolving has finished or timeout has happened.
- `user_data` – The user data.
- `timeout` – The timeout value for the query. Possible values: `SYS_FOREVER_MS`: the query is tried forever, user needs to cancel it manually if it takes too long time to finish `>0`: start the query and let the system timeout it after specified ms

**Returns** 0 if resolving was started ok, `< 0` otherwise

```
struct dns_resolve_context *dns_resolve_get_default(void)
```

Get default DNS context.

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in `subsys/net/lib/dns/Kconfig` file.

**Returns** Default DNS context.

```
static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t  
                                *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t  
                                timeout)
```

Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

#### Parameters

- `query` – What the caller wants to resolve.
- `type` – What kind of data the caller wants to get.
- `dns_id` – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- `cb` – Callback to call after the resolving has finished or timeout has happened.
- `user_data` – The user data.
- `timeout` – The timeout value for the connection. Possible values: `SYS_FOREVER_MS`: the query is tried forever, user needs to cancel it manually if it takes too long time to finish `>0`: start the query and let the system timeout it after specified ms

**Returns** 0 if resolving was started ok, `< 0` otherwise

```
static inline int dns_cancel_addr_info(uint16_t dns_id)
```

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

#### Parameters

- `dns_id` – DNS id of the pending query

**Returns** 0 if ok, <0 if error.

```
struct dns_addrinfo
```

*#include <dns\_resolve.h>* Address info struct is passed to callback that gets all the results.

```
struct dns_resolve_context
```

*#include <dns\_resolve.h>* DNS resolve context structure.

### Public Members

```
struct sockaddr dns_server
```

DNS server information

```
struct net_context *net_ctx
```

Connection to the DNS server

```
uint8_t is_mdns
```

Is this server mDNS one

```
uint8_t is_llmnr
```

Is this server LLMNR one

```
struct k_mutex lock
```

Prevent concurrent access

```
k_timeout_t buf_timeout
```

This timeout is also used when a buffer is required from the buffer pools.

```
enum dns_resolve_context_state state
```

Is this context in use

```
struct dns_pending_query
```

*#include <dns\_resolve.h>* Result callbacks. We have multiple callbacks here so that it is possible to do multiple queries at the same time.

Contents of this structure can be inspected and changed only when the lock is held.

### Public Members

```
struct k_work_delayable timer
```

Timeout timer

```
struct dns_resolve_context *ctx
```

Back pointer to ctx, needed in timeout handler

```
dns_resolve_cb_t cb
```

Result callback.

A null value indicates the slot is not in use.

```
void *user_data
```

User data

```
k_timeout_t timeout
```

TX timeout

```
const char *query
```

String containing the thing to resolve like www.example.com

This is set to a non-null value when the query is started, and is not used thereafter.

If the query completed at a point where the work item was still pending the pointer is cleared to indicate that the query is complete, but release of the query slot will be deferred until a request for a slot determines that the work item has been released.

```
enum dns_query_type query_type
```

Query type

```
uint16_t id
```

DNS id of this query

```
uint16_t query_hash
```

Hash of the DNS name + query type we are querying. This hash is calculated so we can match the response that we are receiving. This is needed mainly for mDNS which is setting the DNS id to 0, which means that the id alone cannot be used to find correct pending query.

## Network Management

- [Overview](#)
- [Requesting a defined procedure](#)
- [Listening to network events](#)
- [Defining a network management procedure](#)
- [Signaling a network event](#)
- [API Reference](#)

**Overview** The Network Management APIs allow applications, as well as network layer code itself, to call defined network routines at any level in the IP stack, or receive notifications on relevant network events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at build time for management routines that are not used. Distinct and statically defined APIs for network management procedures are not used. Instead, defined procedure handlers are registered by using a `NET_MGMT_REGISTER_REQUEST_HANDLER` macro. Procedure requests are done through a single `net_mgmt()` API that invokes the registered handler for the corresponding request.

The current implementation is experimental and may change and improve in future releases.

**Requesting a defined procedure** All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

**Listening to network events** You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

Two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

**Warning:** Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function **must** check the event code (passed as an argument) against the specific network events it will handle, **regardless** of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(False positives can occur for events which have the same layer and layer code.)

An example follows.

```
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)

    net_mgmt_add_event_callback(&ipv4_callback);
}
```

See `include/net/net_event.h` for available generic core events that can be listened to.

**Defining a network management procedure** You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated `mgmt_request` code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if L2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the `include/net/net_event.h` header file. But in case of an L2 technology, let's say Ethernet, these would be found in `include/net/ethernet.h`

You define your handler modeled with this signature:

```
static int your_handler(uint32_t mgmt_event, struct net_if *iface,
                        void *data, size_t len);
```

and then register it with an associated `mgmt_request` code:

```
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```
net_mgmt(<mgmt_request code>, ...);
```

**Signaling a network event** You can signal a specific network event using the `net_mgmt_notify()` function and provide the network event code. See `include/net/net_mgmt.h` for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example `include/net/ieee802154_mgmt.h` would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

## API Reference

group net\_mgmt

Network Management.

## Defines

```
net_mgmt(_mgmt_request, _iface, _data, _len)

NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)

NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)
```

## Typedefs

```
typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net\_if *iface, void
*data, size_t len)
```

Signature which all Net MGMT request handler need to follow.

**Param mgmt\_request** The exact request value the handler is being called through

**Param iface** A valid pointer on struct [net\\_if](#) if the request is meant to be tight to a network interface. NULL otherwise.

**Param data** A valid pointer on a data understood by the handler. NULL otherwise.

**Param len** Length in byte of the memory pointed by data.

```
typedef void (*net_mgmt_event_handler_t)(struct net\_mgmt\_event\_callback *cb, uint32_t
mgmt_event, struct net\_if *iface)
```

Define the user's callback handler function signature.

**Param cb** Original struct [net\\_mgmt\\_event\\_callback](#) owning this handler.

**Param mgmt\_event** The network event being notified.

**Param iface** A pointer on a struct [net\\_if](#) to which the the event belongs to, if it's an event on an iface. NULL otherwise.

## Functions

```
static inline void net_mgmt_init_event_callback(struct net\_mgmt\_event\_callback *cb,
net\_mgmt\_event\_handler\_t handler, uint32_t
mgmt_event_mask)
```

Helper to initialize a struct [net\\_mgmt\\_event\\_callback](#) properly.

### Parameters

- cb – A valid application's callback structure pointer.
- handler – A valid handler function pointer.
- mgmt\_event\_mask – A mask of relevant events for the handler

```
void net_mgmt_add_event_callback(struct net\_mgmt\_event\_callback *cb)
```

Add a user callback.

### Parameters

- cb – A valid pointer on user's callback to add.

```
void net_mgmt_del_event_callback(struct net\_mgmt\_event\_callback *cb)
```

Delete a user callback.

### Parameters

- cb – A valid pointer on user's callback to delete.

```
void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net\_if *iface, const void
                                     *info, size_t length)
```

Used by the system to notify an event.

Note: info and length are disabled if CONFIG\_NET\_MGMT\_EVENT\_INFO is not defined.

#### Parameters

- `mgmt_event` – The actual network event code to notify
- `iface` – a valid pointer on a struct [net\\_if](#) if only the event is based on an iface. NULL otherwise.
- `info` – a valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
- `length` – size of the data pointed by info pointer.

```
static inline void net_mgmt_event_notify(uint32_t mgmt_event, struct net\_if *iface)
```

```
int net_mgmt_event_wait(uint32_t mgmt_event_mask, uint32_t *raised_event, struct net\_if
                        **iface, const void **info, size_t *info_length, k\_timeout\_t timeout)
```

Used to wait synchronously on an event mask.

#### Parameters

- `mgmt_event_mask` – A mask of relevant events to wait on.
- `raised_event` – a pointer on a uint32\_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
- `iface` – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET\_MGMT\_IFACE\_BIT set relevantly, depending on events the caller wants to listen to.
- `info` – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
- `info_length` – tells how long the info memory area is. Only valid if the info is not NULL.
- `timeout` – A timeout delay. K\_FOREVER can be used to wait indefinitely.

**Returns** 0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

```
int net_mgmt_event_wait_on_iface(struct net\_if *iface, uint32_t mgmt_event_mask, uint32_t
                                *raised_event, const void **info, size_t *info_length,
                                k\_timeout\_t timeout)
```

Used to wait synchronously on an event mask for a specific iface.

#### Parameters

- `iface` – a pointer on a valid network interface to listen event to
- `mgmt_event_mask` – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET\_MGMT\_IFACE\_BIT set.
- `raised_event` – a pointer on a uint32\_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
- `info` – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.

- `info_length` – tells how long the info memory area is. Only valid if the info is not NULL.
- `timeout` – A timeout delay. `K_FOREVER` can be used to wait indefinitely.

**Returns** 0 on success, a negative error code otherwise. `-ETIMEDOUT` will be specifically returned if the timeout kick-in instead of an actual event.

`void net_mgmt_event_init(void)`

Used by the core of the network stack to initialize the network event processing.

`struct net_mgmt_event_callback`

`#include <net_mgmt.h>` Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

## Public Members

`sys_snode_t node`

Meant to be used internally, to insert the callback into a list. So nobody should mess with it.

`net_mgmt_event_handler_t handler`

Actual callback function being used to notify the owner

`struct k_sem *sync_call`

Semaphore meant to be used internally for the synchronous `net_mgmt_event_wait()` function.

`uint32_t event_mask`

A mask of network events on which the above handler should be called in case those events come. Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

`uint32_t raised_event`

Internal place holder when a synchronous event wait is successfully unlocked on a event.

`union net_mgmt_event_callback.[anonymous] [anonymous]`

A mask of network events on which the above handler should be called in case those events come. Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

## Network Statistics

- [Overview](#)
- [API Reference](#)

**Overview** Network statistics are collected if `:kconfig: `CONFIG_NET_STATISTICS`` is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in `subsys/net/ip/Kconfig.stats` file for details.

By default, the system collects network statistics per network interface. This can be controlled by `:kconfig: `CONFIG_NET_STATISTICS_PER_INTERFACE`` option.

The `:kconfig: `CONFIG_NET_STATISTICS_USER_API`` option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See [Network Management](#) for details.

The `:kconfig: `CONFIG_NET_STATISTICS_ETHERNET`` option can be set to collect generic Ethernet statistics. If the `:kconfig: `CONFIG_NET_STATISTICS_ETHERNET_VENDOR`` option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the `:kconfig: `CONFIG_NET_SHELL`` option is set, then network shell can show statistics information with `net stats` command.

## API Reference

`group net_stats`

Network statistics library.

## Defines

`NET_TC_TX_STATS_COUNT`

`NET_TC_RX_STATS_COUNT`

## Typedefs

`typedef uint32_t net_stats_t`

Network statistics counter.

`struct net_stats_bytes`

*#include <net\_stats.h>* Number of bytes sent and received.

## Public Members

`net_stats_t sent`

Number of bytes sent

`net_stats_t received`

Number of bytes received

`struct net_stats_pkts`

*#include <net\_stats.h>* Number of network packets sent and received.

### Public Members

`net_stats_t tx`

Number of packets sent

`net_stats_t rx`

Number of packets received

struct net\_stats\_ip

*#include <net\_stats.h>* IP layer statistics.

### Public Members

`net_stats_t recv`

Number of received packets at the IP layer.

`net_stats_t sent`

Number of sent packets at the IP layer.

`net_stats_t forwarded`

Number of forwarded packets at the IP layer.

`net_stats_t drop`

Number of dropped packets at the IP layer.

struct net\_stats\_ip\_errors

*#include <net\_stats.h>* IP layer error statistics.

### Public Members

`net_stats_t vhlerr`

Number of packets dropped due to wrong IP version or header length.

`net_stats_t hblenerr`

Number of packets dropped due to wrong IP length, high byte.

`net_stats_t lblenerr`

Number of packets dropped due to wrong IP length, low byte.

`net_stats_t fragerr`

Number of packets dropped because they were IP fragments.

`net_stats_t chkerr`

Number of packets dropped due to IP checksum errors.

`net_stats_t protoerr`

Number of packets dropped because they were neither ICMP, UDP nor TCP.

```
struct net_stats_icmp
    #include <net_stats.h> ICMP statistics.
```

### Public Members

[\*net\\_stats\\_t\*](#) `recv`  
Number of received ICMP packets.

[\*net\\_stats\\_t\*](#) `sent`  
Number of sent ICMP packets.

[\*net\\_stats\\_t\*](#) `drop`  
Number of dropped ICMP packets.

[\*net\\_stats\\_t\*](#) `typeerr`  
Number of ICMP packets with a wrong type.

[\*net\\_stats\\_t\*](#) `chkerr`  
Number of ICMP packets with a bad checksum.

```
struct net_stats_tcp
    #include <net_stats.h> TCP statistics.
```

### Public Members

struct [\*net\\_stats\\_bytes\*](#) `bytes`  
Amount of received and sent TCP application data.

[\*net\\_stats\\_t\*](#) `resent`  
Amount of retransmitted data.

[\*net\\_stats\\_t\*](#) `drop`  
Number of dropped packets at the TCP layer.

[\*net\\_stats\\_t\*](#) `recv`  
Number of received TCP segments.

[\*net\\_stats\\_t\*](#) `sent`  
Number of sent TCP segments.

[\*net\\_stats\\_t\*](#) `seg_drop`  
Number of dropped TCP segments.

[\*net\\_stats\\_t\*](#) `chkerr`  
Number of TCP segments with a bad checksum.

`net_stats_t ackerr`

Number of received TCP segments with a bad ACK number.

`net_stats_t rsterr`

Number of received bad TCP RST (reset) segments.

`net_stats_t rst`

Number of received TCP RST (reset) segments.

`net_stats_t rexmit`

Number of retransmitted TCP segments.

`net_stats_t conndrop`

Number of dropped connection attempts because too few connections were available.

`net_stats_t connrst`

Number of connection attempts for closed ports, triggering a RST.

`struct net_stats_udp`

*#include* <net\_stats.h> UDP statistics.

### Public Members

`net_stats_t drop`

Number of dropped UDP segments.

`net_stats_t recv`

Number of received UDP segments.

`net_stats_t sent`

Number of sent UDP segments.

`net_stats_t chkerr`

Number of UDP segments with a bad checksum.

`struct net_stats_ipv6_nd`

*#include* <net\_stats.h> IPv6 neighbor discovery statistics.

`struct net_stats_ipv6_mld`

*#include* <net\_stats.h> IPv6 multicast listener daemon statistics.

### Public Members

`net_stats_t recv`

Number of received IPv6 MLD queries

`net_stats_t` sent

Number of sent IPv6 MLD reports

`net_stats_t` drop

Number of dropped IPv6 MLD packets

struct `net_stats_ipv4_igmp`

`#include <net_stats.h>` IPv4 IGMP daemon statistics.

### Public Members

`net_stats_t` recv

Number of received IPv4 IGMP queries

`net_stats_t` sent

Number of sent IPv4 IGMP reports

`net_stats_t` drop

Number of dropped IPv4 IGMP packets

struct `net_stats_tx_time`

`#include <net_stats.h>` Network packet transfer times for calculating average TX time.

struct `net_stats_rx_time`

`#include <net_stats.h>` Network packet receive times for calculating average RX time.

struct `net_stats_tc`

`#include <net_stats.h>` Traffic class statistics.

struct `net_stats_pm`

`#include <net_stats.h>` Power management statistics.

struct `net_stats`

`#include <net_stats.h>` All network statistics in one struct.

### Public Members

`net_stats_t` processing\_error

Count of malformed packets or packets we do not have handler for

struct `net_stats_bytes` bytes

This calculates amount of data transferred through all the network interfaces.

struct `net_stats_ip_errors` ip\_errors

IP layer errors

```

struct net_stats_eth_errors
    #include <net_stats.h> Ethernet error statistics.

struct net_stats_eth_flow
    #include <net_stats.h> Ethernet flow control statistics.

struct net_stats_eth_csum
    #include <net_stats.h> Ethernet checksum statistics.

struct net_stats_eth_hw_timestamp
    #include <net_stats.h> Ethernet hardware timestamp statistics.

struct net_stats_eth
    #include <net_stats.h> All Ethernet specific statistics.

struct net_stats_ppp
    #include <net_stats.h> All PPP specific statistics.

```

### Public Members

[`net\_stats\_t`](#) drop  
Number of received and dropped PPP frames.

[`net\_stats\_t`](#) chkerr  
Number of received PPP frames with a bad checksum.

## Network Timeout

- [Overview](#)
- [Use](#)
- [API Reference](#)

**Overview** Zephyr’s network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (INT32\_MAX), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The `net_timeout` API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

**Use** The simplest use of this API is:

1. Configure a network timeout using `net_timeout_set()`.
2. Use `net_timeout_evaluate()` to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use `net_timeout_evaluate()` again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use `net_timeout_remaining()` to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The `net_timeout` contains a `sys_snode_t` that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use `net_timeout_evaluate()` on all instances to determine the next timeout event to occur.

`net_timeout_deadline()` may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

## API Reference

group `net_timeout`

Network long timeout primitives and helpers.

### Defines

`NET_TIMEOUT_MAX_VALUE`

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing “deadline” to “now” with enough “slop” to handle any observable latency due to “now” advancing past “deadline”.

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at `INT32_MAX`. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.

### Functions

`void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)`

Configure a network timeout structure.

#### Parameters

- `timeout` – a pointer to the timeout state.
- `lifetime` – the duration of the timeout in seconds.
- `now` – the time at which the timeout started counting down, in milliseconds. This is generally a captured value of `k_uptime_get_32()`.

`int64_t net_timeout_deadline(const struct net\_timeout *timeout, int64_t now)`

Return the 64-bit system time at which the timeout will complete.

---

**Note:** Correct behavior requires invocation of [net\\_timeout\\_evaluate\(\)](#) at its specified intervals.

---

#### Parameters

- `timeout` – state a pointer to the timeout state, initialized by [net\\_timeout\\_set\(\)](#) and maintained by [net\\_timeout\\_evaluate\(\)](#).
- `now` – the full-precision value of [k\\_uptime\\_get\(\)](#) relative to which the deadline will be calculated.

**Returns** the value of [k\\_uptime\\_get\(\)](#) at which the timeout will expire.

`uint32_t net_timeout_remaining(const struct net\_timeout *timeout, uint32_t now)`

Calculate the remaining time to the timeout in whole seconds.

---

**Note:** This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

---

---

**Note:** Correct behavior requires invocation of [net\\_timeout\\_evaluate\(\)](#) at its specified intervals.

---

#### Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from [k\\_uptime\\_get\\_32\(\)](#).

#### Return values

- 0 – if the timeout has completed.
- `positive` – the remaining duration of the timeout, in seconds.

`uint32_t net_timeout_evaluate(struct net\_timeout *timeout, uint32_t now)`

Update state to reflect elapsed time and get new delay.

This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

#### Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from [k\\_uptime\\_get\\_32\(\)](#).

#### Return values

- 0 – if the timeout has completed
- `positive` – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

struct net\_timeout

*#include <net\_timeout.h>* Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

### Public Members

sys\_snode\_t node

Used to link multiple timeouts that share a common timer infrastructure.

For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.

## Networking Context

The net\_context API is not meant for application use. Application should use [BSD Sockets](#) API instead.

## Promiscuous Mode

- [Overview](#)
- [Sample usage](#)
- [API Reference](#)

**Overview** Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the [Wikipedia article on promiscuous mode](#) for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

**Sample usage** First the promiscuous mode needs to be turned ON by the application like this:

```
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for "
               "interface %p (%d)\n", iface, ret);
    }
}
```

If there is no error, then the application can start to wait for network data:

```
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }

    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```
ret = net_promisc_mode_off(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already disabled\n");
    } else {
        printf("Cannot disable promiscuous mode for "
               "interface %p (%d)\n", iface, ret);
    }
}
```

See `net-promiscuous-mode-sample` for a more comprehensive example.

## API Reference

*group* promiscuous

Promiscuous mode support.

### Functions

static inline struct *net\_pkt* \*net\_promisc\_mode\_wait\_data(*k\_timeout\_t* timeout)

Start to wait received network packets.

#### Parameters

- timeout – How long to wait before returning.

**Returns** Received *net\_pkt*, NULL if not received any packet.

static inline int net\_promisc\_mode\_on(struct *net\_if* \*iface)

Enable promiscuous mode for a given network interface.

#### Parameters

- iface – Network interface

**Returns** 0 if ok, <0 if error

static inline int net\_promisc\_mode\_off(struct *net\_if* \*iface)

Disable promiscuous mode for a given network interface.

#### Parameters

- iface – Network interface

**Returns** 0 if ok, <0 if error

## Simple Network Time Protocol Library

- [Overview](#)
- [API Reference](#)

**Overview** The SNTP library implements [IETF RFC4330 \(Simple Network Time Protocol v4\)](#). SNTP provides a way to synchronize clocks in computer networks.

### API Reference

*group* sntp

Simple Network Time Protocol API.

#### Functions

int sntp\_init(struct [sntp\\_ctx](#) \*ctx, struct [sockaddr](#) \*addr, [socklen\\_t](#) addr\_len)

Initialize SNTP context.

##### Parameters

- ctx – Address of sntp context.
- addr – IP address of NTP/SNTP server.
- addr\_len – IP address length of NTP/SNTP server.

**Returns** 0 if ok, <0 if error.

int sntp\_query(struct [sntp\\_ctx](#) \*ctx, uint32\_t timeout, struct [sntp\\_time](#) \*time)

Perform SNTP query.

##### Parameters

- ctx – Address of sntp context.
- timeout – Timeout of waiting for sntp response (in milliseconds).
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

**Returns** 0 if ok, <0 if error (-ETIMEDOUT if timeout).

void sntp\_close(struct [sntp\\_ctx](#) \*ctx)

Release SNTP context.

##### Parameters

- ctx – Address of sntp context.

int sntp\_simple(const char \*server, uint32\_t timeout, struct [sntp\\_time](#) \*time)

Convenience function to query SNTP in one-shot fashion.

Convenience wrapper which calls [getaddrinfo\(\)](#), [sntp\\_init\(\)](#), [sntp\\_query\(\)](#), and [sntp\\_close\(\)](#).

##### Parameters

- server – Address of server in format addr[:port]
- timeout – Query timeout
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

**Returns** 0 if ok, <0 if error (-ETIMEDOUT if timeout).

```
struct sntp_ctx
    #include <sntp.h> SNTP context
```

### Public Members

```
uint32_t expected_orig_ts
```

Timestamp when the request was sent from client to server. This is used to check if the originated timestamp in the server reply matches the one in client request.

```
struct sntp_time
```

#include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970

## SOCKS5 Proxy Support

- [Overview](#)
- [SOCKS5 API](#)
- [SOCKS5 Proxy Usage in MQTT](#)

**Overview** The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this [SOCKS5 Wikipedia article](#) for a detailed overview of how SOCKS5 works.

For more information about the protocol itself, see [IETF RFC1928 SOCKS Protocol Version 5](#).

**SOCKS5 API** The SOCKS5 support is enabled by `:kconfig: `CONFIG_SOCKS`` Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling `setsockopt()` like this:

```
static int set_proxy(int sock, const struct sockaddr *proxy_addr,
                    socklen_t proxy_addrlen)
{
    int ret;

    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5,
                    proxy_addr, proxy_addrlen);
    if (ret < 0) {
        return -errno;
    }

    return 0;
}
```

**SOCKS5 Proxy Usage in MQTT** For MQTT client, there is `mqtt_client_set_proxy()` API that the application can call to setup SOCKS5 proxy. See `mqtt-publisher-sample` for usage example.

## Trickle Timer Library

- [Overview](#)
- [API Reference](#)

**Overview** The Trickle timer library implements [IETF RFC6206 \(Trickle Algorithm\)](#).

The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

### API Reference

*group* `trickle`

Trickle algorithm library.

#### Typedefs

`typedef void (*net_trickle_cb_t)(struct net\_trickle *trickle, bool do_suppress, void *user_data)`  
Trickle timer callback.

The callback is called after Trickle timeout expires.

**Param `trickle`** The trickle context to use.

**Param `do_suppress`** Is TX allowed (true) or not (false).

**Param `user_data`** The user data given in [net\\_trickle\\_start\(\)](#) call.

#### Functions

`int net_trickle_create(struct net\_trickle *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)`  
Create a Trickle timer.

##### Parameters

- `trickle` – Pointer to Trickle struct.
- `Imin` – Imin configuration parameter in ms.
- `Imax` – Max number of doublings.
- `k` – Redundancy constant parameter. See RFC 6206 for details.

**Returns** Return 0 if ok and <0 if error.

`int net_trickle_start(struct net\_trickle *trickle, net\_trickle\_cb\_t cb, void *user_data)`  
Start a Trickle timer.

##### Parameters

- `trickle` – Pointer to Trickle struct.
- `cb` – User callback to call at time T within the current trickle interval
- `user_data` – User pointer that is passed to callback.

**Returns** Return 0 if ok and <0 if error.

```
int net_trickle_stop(struct net_trickle *trickle)
```

Stop a Trickle timer.

**Parameters**

- `trickle` – Pointer to Trickle struct.

**Returns** Return 0 if ok and <0 if error.

```
void net_trickle_consistency(struct net_trickle *trickle)
```

To be called by the protocol handler when it hears a consistent network transmission.

**Parameters**

- `trickle` – Pointer to Trickle struct.

```
void net_trickle_inconsistency(struct net_trickle *trickle)
```

To be called by the protocol handler when it hears an inconsistent network transmission.

**Parameters**

- `trickle` – Pointer to Trickle struct.

```
static inline bool net_trickle_is_running(struct net_trickle *trickle)
```

Check if the Trickle timer is running or not.

**Parameters**

- `trickle` – Pointer to Trickle struct.

**Returns** Return True if timer is running and False if not.

```
struct net_trickle
```

*#include <trickle.h>* The variable names are taken directly from RFC 6206 when applicable. Note that the struct members should not be accessed directly but only via the Trickle API.

## Public Members

```
uint32_t Imin
```

Min interval size in ms

```
uint8_t Imax
```

Max number of doublings

```
uint8_t k
```

Redundancy constant

```
uint32_t I
```

Current interval size

```
uint32_t Istart
```

Start of the interval in ms

```
uint8_t c
```

Consistency counter

```
uint32_t Imax_abs
```

Max interval size in ms (not doublings)

*net\_trickle\_cb\_t* cb

Callback to be called when timer expires

## Websocket Client API

- [Overview](#)
- [Websocket Transport](#)
- [API Reference](#)

**Overview** The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this [Websocket Wikipedia article](#) for a detailed overview of how Websocket works.

For more information about the protocol itself, see [IETF RFC6455 The WebSocket Protocol](#).

**Websocket Transport** The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling `:kconfig: `CONFIG_MQTT_LIB_WEBSOCKET`` and `:kconfig: `CONFIG_WEBSOCKET_CLIENT`` Kconfig options.

First a socket needs to be created and connected to the Websocket server:

```
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...
```

The Websocket transport socket is then created like this:

```
ws_sock = websocket_connect(sock, &config, timeout, user_data);
```

The Websocket socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the `websocket_xxx()` API or normal BSD socket API functions can be used to send and receive application data.

```
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len,
                        WEBSOCKET_OPCODE_DATA_BINARY, true, true,
                        K_FOREVER);
...
ret = send(ws_sock, buf_to_send, buf_len, 0);
```

If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the `websocket_send_msg()` must be used.

When done, the Websocket transport socket must be closed.

```
ret = close(ws_sock);
or
ret = websocket_disconnect(ws_sock);
```

## API Reference

group websocket

Websocket API.

## Defines

WEBSOCKET\_FLAG\_FINAL

Message type values. Returned in *websocket\_recv\_msg()* Final frame

WEBSOCKET\_FLAG\_TEXT

Textual data

WEBSOCKET\_FLAG\_BINARY

Binary data

WEBSOCKET\_FLAG\_CLOSE

Closing connection

WEBSOCKET\_FLAG\_PING

Ping message

WEBSOCKET\_FLAG\_PONG

Pong message

## Typedefs

typedef int (\*websocket\_connect\_cb\_t)(int ws\_sock, struct http\_request \*req, void \*user\_data)

Callback called after Websocket connection is established.

**Param ws\_sock** Websocket id

**Param req** HTTP handshake request

**Param user\_data** A valid pointer on some user data or NULL

**Return** 0 if ok, <0 if there is an error and connection should be aborted

## Enums

enum websocket\_opcode

*Values:*

enumerator WEBSOCKET\_OPCODE\_CONTINUE = 0x00

enumerator WEBSOCKET\_OPCODE\_DATA\_TEXT = 0x01

enumerator WEBSOCKET\_OPCODE\_DATA\_BINARY = 0x02

```
enumerator WEBSOCKET_OPCODE_CLOSE = 0x08
```

```
enumerator WEBSOCKET_OPCODE_PING = 0x09
```

```
enumerator WEBSOCKET_OPCODE_PONG = 0x0A
```

## Functions

```
int websocket_connect(int http_sock, struct websocket_request *req, int32_t timeout, void  
                    *user_data)
```

Connect to a server that provides Websocket service. The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

### Parameters

- `http_sock` – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the `http_sock` must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- `req` – Websocket request. User should allocate and fill the request data.
- `timeout` – Max timeout to wait for the connection. The timeout value is in milliseconds. Value `SYS_FOREVER_MS` means to wait forever.
- `user_data` – User specified data that is passed to the callback.

**Returns** Websocket id to be used when sending/receiving Websocket data.

```
int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum  
                     websocket_opcode opcode, bool mask, bool final, int32_t timeout)
```

Send websocket msg to peer.

The function will automatically add websocket header to the message.

### Parameters

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `payload` – Websocket data to send.
- `payload_len` – Length of the data to be sent.
- `opcode` – Operation code (text, binary, ping, pong, close)
- `mask` – Mask the data, see RFC 6455 for details
- `final` – Is this final message for this message send. If `final == false`, then the first message must have valid opcode and subsequent messages must have opcode `WEBSOCKET_OPCODE_CONTINUE`. If `final == true` and this is the only message, then opcode should have proper opcode (text or binary) set.
- `timeout` – How long to try to send the message. The value is in milliseconds. Value `SYS_FOREVER_MS` means to wait forever.

**Returns** <0 if error, >=0 amount of bytes sent

```
int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type,  
                     uint64_t *remaining, int32_t timeout)
```

Receive websocket msg from peer.

The function will automatically remove websocket header from the message.

### Parameters

- `ws_sock` – Websocket id returned by [websocket\\_connect\(\)](#).
- `buf` – Buffer where websocket data is read.
- `buf_len` – Length of the data buffer.
- `message_type` – Type of the message.
- `remaining` – How much there is data left in the message after this read.
- `timeout` – How long to try to receive the message. The value is in milliseconds. Value `SYS_FOREVER_MS` means to wait forever.

**Returns** <0 if error, >=0 amount of bytes received

```
int websocket_disconnect(int ws_sock)
```

Close websocket.

One must call [websocket\\_connect\(\)](#) after this call to re-establish the connection.

### Parameters

- `ws_sock` – Websocket id returned by [websocket\\_connect\(\)](#).

```
static inline void websocket_init(void)
```

```
struct websocket_request
```

*#include <websocket.h>* Websocket client connection request. This contains all the data that is needed when doing a Websocket connection request.

### Public Members

```
const char *host
```

Host of the Websocket server when doing HTTP handshakes.

```
const char *url
```

URL of the Websocket.

```
http_header_cb_t optional_headers_cb
```

User supplied callback function to call when optional headers need to be sent. This can be NULL, in which case the `optional_headers` field in `http_request` is used. The idea of this `optional_headers` callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

```
const char **optional_headers
```

A NULL terminated list of any optional headers that should be added to the HTTP request. May be NULL. If the `optional_headers_cb` is specified, then this field is ignored.

```
websocket\_connect\_cb\_t cb
```

User supplied callback function to call when a connection is established.

```
const struct http_parser_settings *http_cb
```

User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake. This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.

```
uint8_t *tmp_buf
```

User supplied buffer where HTTP connection data is stored

```
size_t tmp_buf_len
```

Length of the user supplied temp buffer

## Network Packet Capture

- [Overview](#)
- [Sample usage](#)
- [API Reference](#)

**Overview** The `net_capture` API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using `net-shell` or automatically by using the `net_capture` API.

**Sample usage** See Network capture sample application and [Monitor Network Traffic](#) for details.

## API Reference

*group* `net_capture`

Network packet capture support functions.

### Functions

```
int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char  
                     *peer_addr, const struct device **dev)
```

Setup network packet capturing support.

#### Parameters

- `remote_addr` – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.
- `my_local_addr` – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.
- `peer_addr` – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.
- `dev` – Network capture device. This is returned to the caller.

**Returns** 0 if ok, <0 if network packet capture setup failed

```
static inline int net_capture_cleanup(const struct device *dev)
```

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

#### Parameters

- `dev` – Network capture device. User must allocate using the [net\\_capture\\_setup\(\)](#) function.

**Returns** 0 if ok, <0 if network packet capture cleanup failed

```
static inline int net_capture_enable(const struct device *dev, struct net_if *iface)
```

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

#### Parameters

- *dev* – Network capture device
- *iface* – Network interface we are starting to capture packets.

**Returns** 0 if ok, <0 if network packet capture enable failed

```
static inline bool net_capture_is_enabled(const struct device *dev)
```

Is network packet capture enabled or disabled.

#### Parameters

- *dev* – Network capture device

**Returns** True if enabled, False if network capture is disabled.

```
static inline int net_capture_disable(const struct device *dev)
```

Disable network packet capturing support.

#### Parameters

- *dev* – Network capture device

**Returns** 0 if ok, <0 if network packet capture disable failed

```
static inline int net_capture_send(const struct device *dev, struct net_if *iface, struct net_pkt *pkt)
```

Send captured packet.

#### Parameters

- *dev* – Network capture device
- *iface* – Network interface the packet is being sent
- *pkt* – The network packet that is sent

**Returns** 0 if ok, <0 if network packet capture send failed

## 7.20.2 Network Buffer Management

### Network Buffer

- [Overview](#)
- [Creating buffers](#)
- [Common Operations](#)
- [Reference Counting](#)
- [API Reference](#)

**Overview** Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in `include/net/buf.h`.

**Creating buffers** Network buffers are created by first defining a pool of them:

```
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as `net_buf_alloc()` gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through `k_fifo` kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a `net_buf` may have a fragment chain attached to it, instead of using the `k_fifo_put()` and `k_fifo_get()` APIs, special `net_buf_put()` and `net_buf_get()` APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the `net_buf_slist_put()` and `net_buf_slist_get()` functions must be used instead of `sys_slist_append()` and `sys_slist_get()`.

**Common Operations** The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it's good to understand the basic names of operations used with them:

**Add** Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

**Remove** Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

**Push** Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
```

**Pull** Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

**Reference Counting** Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

## API Reference

group `net_buf`

Network buffer library.

### Defines

`NET_BUF_SIMPLE_DEFINE(_name, _size)`

Define a `net_buf_simple` stack variable.

This is a helper macro which is used to define a `net_buf_simple` object on the stack.

#### Parameters

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)`

Define a static `net_buf_simple` variable.

This is a helper macro which is used to define a static `net_buf_simple` object.

#### Parameters

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE(_size)`

Define a `net_buf_simple` stack variable and get a pointer to it.

This is a helper macro which is used to define a `net_buf_simple` object on the stack and the get a pointer to it as follows:

```
struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);
```

After creating the object it needs to be initialized by calling `net_buf_simple_init()`.

#### Parameters

- `_size` – Maximum data storage for the buffer.

**Returns** Pointer to stack-allocated `net_buf_simple` object.

**NET\_BUF\_FRAGS**

Flag indicating that the buffer has associated fragments. Only used internally by the buffer handling code while the buffer is inside a FIFO, meaning this never needs to be explicitly set or unset by the [net\\_buf](#) API user. As long as the buffer is outside of a FIFO, i.e. in practice always for the user for this API, the `buf->frags` pointer should be used instead.

**NET\_BUF\_EXTERNAL\_DATA**

Flag indicating that the buffer's associated data pointer, points to externally allocated memory. Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the [net\\_buf](#) API user. Such [net\\_buf](#) is exclusively instantiated via [net\\_buf\\_alloc\\_with\\_data\(\)](#) function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the [net\\_buf](#) but not the data pointer in it.

**NET\_BUF\_POOL\_HEAP\_DEFINE(\_name, \_count, \_destroy)**

Define a new pool for buffers using the heap for the data.

Defines a [net\\_buf\\_pool](#) struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using `k_malloc`, so `CONFIG_HEAP_MEM_POOL_SIZE` must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to `net_buf_alloc` will be always treated as `K_NO_WAIT` when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling [net\\_buf\\_destroy\(\)](#) to complete the process of returning the buffer to the pool.

**Parameters**

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_destroy` – Optional destroy callback when buffer is freed.

**NET\_BUF\_POOL\_FIXED\_DEFINE(\_name, \_count, \_data\_size, \_destroy)**

Define a new pool for buffers based on fixed-size data.

Defines a [net\\_buf\\_pool](#) struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to `net_buf_alloc` will be always treated as `K_NO_WAIT` when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling [net\\_buf\\_destroy\(\)](#) to complete the process of returning the buffer to the pool.

**Parameters**

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Maximum data payload per buffer.

- `_destroy` – Optional destroy callback when buffer is freed.

`NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _destroy)`

Define a new pool for buffers with variable size payloads.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

#### Parameters

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Total amount of memory available for data payloads.
- `_destroy` – Optional destroy callback when buffer is freed.

`NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)`

Define a new pool for buffers.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

#### Parameters

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_size` – Maximum data size for each buffer.
- `_ud_size` – Amount of user data space to reserve.
- `_destroy` – Optional destroy callback when buffer is freed.

## Typedefs

`typedef struct net_buf *(*net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)`

Network buffer allocator callback.

The allocator callback is called when `net_buf_append_bytes` needs to allocate a new `net_buf`.

**Param timeout** Affects the action taken should the net buf pool be empty. If `K_NO_WAIT`, then return immediately. If `K_FOREVER`, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Param user\_data** The user data given in `net_buf_append_bytes` call.

**Return** pointer to allocated `net_buf` or NULL on error.

## Functions

static inline void net\_buf\_simple\_init(struct *net\_buf\_simple* \*buf, size\_t reserve\_head)

Initialize a *net\_buf\_simple* object.

This needs to be called after creating a *net\_buf\_simple* object using the NET\_BUF\_SIMPLE macro.

### Parameters

- buf – Buffer to initialize.
- reserve\_head – Headroom to reserve.

void net\_buf\_simple\_init\_with\_data(struct *net\_buf\_simple* \*buf, void \*data, size\_t size)

Initialize a *net\_buf\_simple* object with data.

Initialized buffer object with external data.

### Parameters

- buf – Buffer to initialize.
- data – External data pointer
- size – Amount of data the pointed data buffer if able to fit.

static inline void net\_buf\_simple\_reset(struct *net\_buf\_simple* \*buf)

Reset buffer.

Reset buffer data so it can be reused for other purposes.

### Parameters

- buf – Buffer to reset.

void net\_buf\_simple\_clone(const struct *net\_buf\_simple* \*original, struct *net\_buf\_simple* \*clone)

Clone buffer state, using the same data buffer.

Initializes a buffer to point to the same data as an existing buffer. Allows operations on the same data without altering the length and offset of the original.

### Parameters

- original – Buffer to clone.
- clone – The new clone.

void \*net\_buf\_simple\_add(struct *net\_buf\_simple* \*buf, size\_t len)

Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

### Parameters

- buf – Buffer to update.
- len – Number of bytes to increment the length with.

**Returns** The original tail of the buffer.

void \*net\_buf\_simple\_add\_mem(struct *net\_buf\_simple* \*buf, const void \*mem, size\_t len)

Copy given number of bytes from memory to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

### Parameters

- buf – Buffer to update.
- mem – Location of data to be added.

- `len` – Length of data to be added

**Returns** The original tail of the buffer.

```
uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)
```

Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – byte value to be added.

**Returns** Pointer to the value added

```
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```
void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```
void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
```

Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

```
void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
```

Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

```
void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
```

Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- buf – Buffer to update.
- val – 32-bit value to be added.

void net\_buf\_simple\_add\_be32(struct *net\_buf\_simple* \*buf, uint32\_t val)

Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

#### Parameters

- buf – Buffer to update.
- val – 32-bit value to be added.

void net\_buf\_simple\_add\_le48(struct *net\_buf\_simple* \*buf, uint64\_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

#### Parameters

- buf – Buffer to update.
- val – 48-bit value to be added.

void net\_buf\_simple\_add\_be48(struct *net\_buf\_simple* \*buf, uint64\_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

#### Parameters

- buf – Buffer to update.
- val – 48-bit value to be added.

void net\_buf\_simple\_add\_le64(struct *net\_buf\_simple* \*buf, uint64\_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

#### Parameters

- buf – Buffer to update.
- val – 64-bit value to be added.

void net\_buf\_simple\_add\_be64(struct *net\_buf\_simple* \*buf, uint64\_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

#### Parameters

- buf – Buffer to update.
- val – 64-bit value to be added.

void \*net\_buf\_simple\_remove\_mem(struct *net\_buf\_simple* \*buf, size\_t len)

Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

#### Parameters

- buf – Buffer to update.

- len – Number of bytes to remove.

**Returns** New end of the buffer data.

uint8\_t net\_buf\_simple\_remove\_u8(struct [net\\_buf\\_simple](#) \*buf)

Remove a 8-bit value from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 8-bit values.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** The 8-bit removed value

uint16\_t net\_buf\_simple\_remove\_le16(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 16-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from little endian to host endian.

uint16\_t net\_buf\_simple\_remove\_be16(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 16-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from big endian to host endian.

uint32\_t net\_buf\_simple\_remove\_le24(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 24-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from little endian to host endian.

uint32\_t net\_buf\_simple\_remove\_be24(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 24-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from big endian to host endian.

uint32\_t net\_buf\_simple\_remove\_le32(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 32-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 32-bit value converted from little endian to host endian.

uint32\_t net\_buf\_simple\_remove\_be32(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 32-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 32-bit value converted from big endian to host endian.

uint64\_t net\_buf\_simple\_remove\_le48(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 48-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 48-bit value converted from little endian to host endian.

uint64\_t net\_buf\_simple\_remove\_be48(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 48-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 48-bit value converted from big endian to host endian.

uint64\_t net\_buf\_simple\_remove\_le64(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 64-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 64-bit value converted from little endian to host endian.

uint64\_t net\_buf\_simple\_remove\_be64(struct [net\\_buf\\_simple](#) \*buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with [net\\_buf\\_simple\\_remove\\_mem\(\)](#), but a helper for operating on 64-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 64-bit value converted from big endian to host endian.

void \*net\_buf\_simple\_push(struct [net\\_buf\\_simple](#) \*buf, size\_t len)

Prepare data to be added to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

**Parameters**

- buf – Buffer to update.

- `len` – Number of bytes to add to the beginning.

**Returns** The new beginning of the buffer data.

`void *net_buf_simple_push_mem(struct net\_buf\_simple *buf, const void *mem, size_t len)`

Copy given number of bytes from memory to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `mem` – Location of data to be added.
- `len` – Length of data to be added.

**Returns** The new beginning of the buffer data.

`void net_buf_simple_push_le16(struct net\_buf\_simple *buf, uint16_t val)`

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

`void net_buf_simple_push_be16(struct net\_buf\_simple *buf, uint16_t val)`

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

`void net_buf_simple_push_u8(struct net\_buf\_simple *buf, uint8_t val)`

Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 8-bit value to be pushed to the buffer.

`void net_buf_simple_push_le24(struct net\_buf\_simple *buf, uint32_t val)`

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.

`void net_buf_simple_push_be24(struct net\_buf\_simple *buf, uint32_t val)`

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.

- `val` – 24-bit value to be pushed to the buffer.

`void net_buf_simple_push_le32(struct net\_buf\_simple *buf, uint32_t val)`

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

`void net_buf_simple_push_be32(struct net\_buf\_simple *buf, uint32_t val)`

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

`void net_buf_simple_push_le48(struct net\_buf\_simple *buf, uint64_t val)`

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

`void net_buf_simple_push_be48(struct net\_buf\_simple *buf, uint64_t val)`

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

`void net_buf_simple_push_le64(struct net\_buf\_simple *buf, uint64_t val)`

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

`void net_buf_simple_push_be64(struct net\_buf\_simple *buf, uint64_t val)`

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

`void *net_buf_simple_pull(struct net\_buf\_simple *buf, size_t len)`

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

**Returns** New beginning of the buffer data.

`void *net_buf_simple_pull_mem(struct net\_buf\_simple *buf, size_t len)`

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

**Returns** Pointer to the old location of the buffer data.

`uint8_t net_buf_simple_pull_u8(struct net\_buf\_simple *buf)`

Remove a 8-bit value from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 8-bit values.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** The 8-bit removed value

`uint16_t net_buf_simple_pull_le16(struct net\_buf\_simple *buf)`

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 16-bit little endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 16-bit value converted from little endian to host endian.

`uint16_t net_buf_simple_pull_be16(struct net\_buf\_simple *buf)`

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 16-bit big endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 16-bit value converted from big endian to host endian.

`uint32_t net_buf_simple_pull_le24(struct net\_buf\_simple *buf)`

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 24-bit little endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 24-bit value converted from little endian to host endian.

`uint32_t net_buf_simple_pull_be24(struct net\_buf\_simple *buf)`

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 24-bit big endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 24-bit value converted from big endian to host endian.

`uint32_t net_buf_simple_pull_le32(struct net\_buf\_simple *buf)`

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 32-bit little endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 32-bit value converted from little endian to host endian.

`uint32_t net_buf_simple_pull_be32(struct net\_buf\_simple *buf)`

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 32-bit big endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 32-bit value converted from big endian to host endian.

`uint64_t net_buf_simple_pull_le48(struct net\_buf\_simple *buf)`

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 48-bit little endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 48-bit value converted from little endian to host endian.

`uint64_t net_buf_simple_pull_be48(struct net\_buf\_simple *buf)`

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 48-bit big endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 48-bit value converted from big endian to host endian.

`uint64_t net_buf_simple_pull_le64(struct net\_buf\_simple *buf)`

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with [net\\_buf\\_simple\\_pull\(\)](#), but a helper for operating on 64-bit little endian data.

**Parameters**

- `buf` – A valid pointer on a buffer.

**Returns** 64-bit value converted from little endian to host endian.

uint64\_t net\_buf\_simple\_pull\_be64(struct *net\_buf\_simple* \*buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net\_buf\_simple\_pull()*, but a helper for operating on 64-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 64-bit value converted from big endian to host endian.

static inline uint8\_t \*net\_buf\_simple\_tail(struct *net\_buf\_simple* \*buf)

Get the tail pointer for a buffer.

Get a pointer to the end of the data in a buffer.

**Parameters**

- buf – Buffer.

**Returns** Tail pointer for the buffer.

size\_t net\_buf\_simple\_headroom(struct *net\_buf\_simple* \*buf)

Check buffer headroom.

Check how much free space there is in the beginning of the buffer.

buf A valid pointer on a buffer

**Returns** Number of bytes available in the beginning of the buffer.

size\_t net\_buf\_simple\_tailroom(struct *net\_buf\_simple* \*buf)

Check buffer tailroom.

Check how much free space there is at the end of the buffer.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** Number of bytes available at the end of the buffer.

uint16\_t net\_buf\_simple\_max\_len(struct *net\_buf\_simple* \*buf)

Check maximum *net\_buf\_simple::len* value.

This value is depending on the number of bytes being reserved as headroom.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** Number of bytes usable behind the *net\_buf\_simple::data* pointer.

static inline void net\_buf\_simple\_save(struct *net\_buf\_simple* \*buf, struct *net\_buf\_simple\_state* \*state)

Save the parsing state of a buffer.

Saves the parsing state of a buffer so it can be restored later.

**Parameters**

- buf – Buffer from which the state should be saved.
- state – Storage for the state.

static inline void net\_buf\_simple\_restore(struct *net\_buf\_simple* \*buf, struct *net\_buf\_simple\_state* \*state)

Restore the parsing state of a buffer.

Restores the parsing state of a buffer from a state previously stored by *net\_buf\_simple\_save()*.

**Parameters**

- `buf` – Buffer to which the state should be restored.
- `state` – Stored state.

```
struct net\_buf\_pool *net_buf_pool_get(int id)
```

Looks up a pool based on its ID.

#### Parameters

- `id` – Pool ID (e.g. from `buf->pool_id`).

**Returns** Pointer to pool.

```
int net_buf_id(struct net\_buf *buf)
```

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of meta-data contexts with the buffers of a pool.

#### Parameters

- `buf` – Network buffer.

**Returns** Zero-based index for the buffer.

```
struct net\_buf *net_buf_alloc_fixed(struct net\_buf\_pool *pool, k\_timeout\_t timeout)
```

Allocate a new fixed buffer from a pool.

#### Parameters

- `pool` – Which pool to allocate the buffer from.
- `timeout` – Affects the action taken should the pool be empty. If `K_NO_WAIT`, then return immediately. If `K_FOREVER`, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for [net\\_buf\\_alloc\(\)](#) to fail (return NULL) even if it was given `K_FOREVER`.

**Returns** New buffer or NULL if out of buffers.

```
static inline struct net\_buf *net_buf_alloc(struct net\_buf\_pool *pool, k\_timeout\_t timeout)
```

#### Parameters

- `pool` – Which pool to allocate the buffer from.
- `timeout` – Affects the action taken should the pool be empty. If `K_NO_WAIT`, then return immediately. If `K_FOREVER`, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for [net\\_buf\\_alloc\(\)](#) to fail (return NULL) even if it was given `K_FOREVER`.

**Returns** New buffer or NULL if out of buffers.

```
struct net\_buf *net_buf_alloc_len(struct net\_buf\_pool *pool, size_t size, k\_timeout\_t timeout)
```

Allocate a new variable length buffer from a pool.

#### Parameters

- `pool` – Which pool to allocate the buffer from.
- `size` – Amount of data the buffer must be able to fit.
- `timeout` – Affects the action taken should the pool be empty. If `K_NO_WAIT`, then return immediately. If `K_FOREVER`, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for [net\\_buf\\_alloc\(\)](#) to fail (return NULL) even if it was given `K_FOREVER`.

**Returns** New buffer or NULL if out of buffers.

```
struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size,  
                                       k_timeout_t timeout)
```

Allocate a new buffer from a pool but with external data pointer.

Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

#### Parameters

- *pool* – Which pool to allocate the buffer from.
- *data* – External data pointer
- *size* – Amount of data the pointed data buffer is able to fit.
- *timeout* – Affects the action taken should the pool be empty. If *K\_NO\_WAIT*, then return immediately. If *K\_FOREVER*, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the *HEAP* type). In this case it's still possible for *net\_buf\_alloc()* to fail (return NULL) even if it was given *K\_FOREVER*.

**Returns** New buffer or NULL if out of buffers.

```
struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)
```

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

#### Parameters

- *fifo* – Which FIFO to take the buffer from.
- *timeout* – Affects the action taken should the FIFO be empty. If *K\_NO\_WAIT*, then return immediately. If *K\_FOREVER*, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Returns** New buffer or NULL if the FIFO is empty.

```
static inline void net_buf_destroy(struct net_buf *buf)
```

Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy callback is given to *NET\_BUF\_POOL\_\*\_DEFINE()* then there is no need to use this API.

#### Parameters

- *buf* – Buffer to destroy.

```
void net_buf_reset(struct net_buf *buf)
```

Reset buffer.

Reset buffer data and flags so it can be reused for other purposes.

#### Parameters

- *buf* – Buffer to reset.

```
void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)
```

Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

#### Parameters

- *buf* – Buffer to initialize.
- *reserve* – How much headroom to reserve.

```
void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)
```

Put a buffer into a list.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the list.

#### Parameters

- `list` – Which list to append the buffer to.
- `buf` – Buffer.

```
struct net_buf *net_buf_slist_get(sys_slist_t *list)
```

Get a buffer from a list.

If the buffer had any fragments, these will automatically be recovered from the list as well and be placed to the buffer's fragment list. This function is NOT thread-safe when recovering fragments.

#### Parameters

- `list` – Which list to take the buffer from.

**Returns** New buffer or NULL if the FIFO is empty.

```
void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)
```

Put a buffer to the end of a FIFO.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the FIFO.

#### Parameters

- `fifo` – Which FIFO to put the buffer to.
- `buf` – Buffer.

```
void net_buf_unref(struct net_buf *buf)
```

Decrements the reference count of a buffer.

The buffer is put back into the pool if the reference count reaches zero.

#### Parameters

- `buf` – A valid pointer on a buffer

```
struct net_buf *net_buf_ref(struct net_buf *buf)
```

Increment the reference count of a buffer.

#### Parameters

- `buf` – A valid pointer on a buffer

**Returns** the buffer newly referenced

```
struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)
```

Clone buffer.

Duplicate given buffer including any data and headers currently stored.

#### Parameters

- `buf` – A valid pointer on a buffer
- `timeout` – Affects the action taken should the pool be empty. If `K_NO_WAIT`, then return immediately. If `K_FOREVER`, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Returns** Cloned buffer or NULL if out of buffers.

```
static inline void *net_buf_user_data(const struct net_buf *buf)
```

Get a pointer to the user data of a buffer.

**Parameters**

- `buf` – A valid pointer on a buffer

**Returns** Pointer to the user data of the buffer.

```
static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
```

Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

**Parameters**

- `buf` – Buffer to initialize.
- `reserve` – How much headroom to reserve.

```
static inline void *net_buf_add(struct net_buf *buf, size_t len)
```

Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to increment the length with.

**Returns** The original tail of the buffer.

```
static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
```

Copies the given number of bytes to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `mem` – Location of data to be added.
- `len` – Length of data to be added

**Returns** The original tail of the buffer.

```
static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
```

Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – byte value to be added.

**Returns** Pointer to the value added

```
static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```
static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```
static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
```

Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

```
static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
```

Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

```
static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)
```

Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

```
static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)
```

Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

```
static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)
```

Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 48-bit value to be added.

static inline void net\_buf\_add\_be48(struct [net\\_buf](#) \*buf, uint64\_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- buf – Buffer to update.
- val – 48-bit value to be added.

static inline void net\_buf\_add\_le64(struct [net\\_buf](#) \*buf, uint64\_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- buf – Buffer to update.
- val – 64-bit value to be added.

static inline void net\_buf\_add\_be64(struct [net\\_buf](#) \*buf, uint64\_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- buf – Buffer to update.
- val – 64-bit value to be added.

static inline void \*net\_buf\_remove\_mem(struct [net\\_buf](#) \*buf, size\_t len)

Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

**Parameters**

- buf – Buffer to update.
- len – Number of bytes to remove.

**Returns** New end of the buffer data.

static inline uint8\_t net\_buf\_remove\_u8(struct [net\\_buf](#) \*buf)

Remove a 8-bit value from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 8-bit values.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** The 8-bit removed value

static inline uint16\_t net\_buf\_remove\_le16(struct [net\\_buf](#) \*buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 16-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from little endian to host endian.

```
static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
```

Remove and convert 16 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 16-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from big endian to host endian.

```
static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
```

Remove and convert 24 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 24-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from big endian to host endian.

```
static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
```

Remove and convert 24 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 24-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from little endian to host endian.

```
static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
```

Remove and convert 32 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 32-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 32-bit value converted from little endian to host endian.

```
static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
```

Remove and convert 32 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 32-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 32-bit value converted from big endian to host endian.

```
static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
```

Remove and convert 48 bits from the end of the buffer.

Same idea as with [net\\_buf\\_remove\\_mem\(\)](#), but a helper for operating on 48-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 48-bit value converted from little endian to host endian.

static inline uint64\_t net\_buf\_remove\_be48(struct *net\_buf* \*buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with *net\_buf\_remove\_mem()*, but a helper for operating on 48-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 48-bit value converted from big endian to host endian.

static inline uint64\_t net\_buf\_remove\_le64(struct *net\_buf* \*buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net\_buf\_remove\_mem()*, but a helper for operating on 64-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 64-bit value converted from little endian to host endian.

static inline uint64\_t net\_buf\_remove\_be64(struct *net\_buf* \*buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net\_buf\_remove\_mem()*, but a helper for operating on 64-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 64-bit value converted from big endian to host endian.

static inline void \*net\_buf\_push(struct *net\_buf* \*buf, size\_t len)

Prepare data to be added at the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

**Parameters**

- buf – Buffer to update.
- len – Number of bytes to add to the beginning.

**Returns** The new beginning of the buffer data.

static inline void \*net\_buf\_push\_mem(struct *net\_buf* \*buf, const void \*mem, size\_t len)

Copies the given number of bytes to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

**Parameters**

- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added.

**Returns** The new beginning of the buffer data.

static inline void net\_buf\_push\_u8(struct *net\_buf* \*buf, uint8\_t val)

Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 8-bit value to be pushed to the buffer.

static inline void `net_buf_push_le16`(struct *net\_buf* \*buf, uint16\_t val)

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

static inline void `net_buf_push_be16`(struct *net\_buf* \*buf, uint16\_t val)

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

static inline void `net_buf_push_le24`(struct *net\_buf* \*buf, uint32\_t val)

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.

static inline void `net_buf_push_be24`(struct *net\_buf* \*buf, uint32\_t val)

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.

static inline void `net_buf_push_le32`(struct *net\_buf* \*buf, uint32\_t val)

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

static inline void `net_buf_push_be32`(struct *net\_buf* \*buf, uint32\_t val)

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

#### Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

```
static inline void net_buf_push_le48(struct net_buf *buf, uint64_t val)
```

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

```
static inline void net_buf_push_be48(struct net_buf *buf, uint64_t val)
```

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in big endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

```
static inline void net_buf_push_le64(struct net_buf *buf, uint64_t val)
```

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in little endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

```
static inline void net_buf_push_be64(struct net_buf *buf, uint64_t val)
```

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in big endian format to the beginning of the buffer.

**Parameters**

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

```
static inline void *net_buf_pull(struct net_buf *buf, size_t len)
```

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

**Returns** New beginning of the buffer data.

```
static inline void *net_buf_pull_mem(struct net_buf *buf, size_t len)
```

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

**Returns** Pointer to the old beginning of the buffer data.

```
static inline uint8_t net_buf_pull_u8(struct net_buf *buf)
```

Remove a 8-bit value from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 8-bit values.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** The 8-bit removed value

```
static inline uint16_t net_buf_pull_le16(struct net_buf *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 16-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from little endian to host endian.

```
static inline uint16_t net_buf_pull_be16(struct net_buf *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 16-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 16-bit value converted from big endian to host endian.

```
static inline uint32_t net_buf_pull_le24(struct net_buf *buf)
```

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 24-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from little endian to host endian.

```
static inline uint32_t net_buf_pull_be24(struct net_buf *buf)
```

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 24-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 24-bit value converted from big endian to host endian.

```
static inline uint32_t net_buf_pull_le32(struct net_buf *buf)
```

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 32-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 32-bit value converted from little endian to host endian.

```
static inline uint32_t net_buf_pull_be32(struct net_buf *buf)
```

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 32-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 32-bit value converted from big endian to host endian.

static inline uint64\_t net\_buf\_pull\_le48(struct *net\_buf* \*buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 48-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 48-bit value converted from little endian to host endian.

static inline uint64\_t net\_buf\_pull\_be48(struct *net\_buf* \*buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 48-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 48-bit value converted from big endian to host endian.

static inline uint64\_t net\_buf\_pull\_le64(struct *net\_buf* \*buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 64-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns** 64-bit value converted from little endian to host endian.

static inline uint64\_t net\_buf\_pull\_be64(struct *net\_buf* \*buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net\_buf\_pull()*, but a helper for operating on 64-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** 64-bit value converted from big endian to host endian.

static inline size\_t net\_buf\_tailroom(struct *net\_buf* \*buf)

Check buffer tailroom.

Check how much free space there is at the end of the buffer.

**Parameters**

- buf – A valid pointer on a buffer

**Returns** Number of bytes available at the end of the buffer.

static inline size\_t net\_buf\_headroom(struct *net\_buf* \*buf)

Check buffer headroom.

Check how much free space there is in the beginning of the buffer.

buf A valid pointer on a buffer

**Returns** Number of bytes available in the beginning of the buffer.

```
static inline uint16_t net_buf_max_len(struct net_buf *buf)
```

Check maximum `net_buf::len` value.

This value is depending on the number of bytes being reserved as headroom.

**Parameters**

- `buf` – A valid pointer on a buffer

**Returns** Number of bytes usable behind the `net_buf::data` pointer.

```
static inline uint8_t *net_buf_tail(struct net_buf *buf)
```

Get the tail pointer for a buffer.

Get a pointer to the end of the data in a buffer.

**Parameters**

- `buf` – Buffer.

**Returns** Tail pointer for the buffer.

```
struct net_buf *net_buf_frag_last(struct net_buf *frags)
```

Find the last fragment in the fragment list.

**Returns** Pointer to last fragment in the list.

```
void net_buf_frag_insert(struct net_buf *parent, struct net_buf *frag)
```

Insert a new fragment to a chain of bufs.

Insert a new fragment into the buffer fragments list after the parent.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

**Parameters**

- `parent` – Parent buffer/fragment.
- `frag` – Fragment to insert.

```
struct net_buf *net_buf_frag_add(struct net_buf *head, struct net_buf *frag)
```

Add a new fragment to the end of a chain of bufs.

Append a new fragment into the buffer fragments list.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

**Parameters**

- `head` – Head of the fragment chain.
- `frag` – Fragment to add.

**Returns** New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

```
struct net_buf *net_buf_frag_del(struct net_buf *parent, struct net_buf *frag)
```

Delete existing fragment from a chain of bufs.

**Parameters**

- `parent` – Parent buffer/fragment, or NULL if there is no parent.
- `frag` – Fragment to delete.

**Returns** Pointer to the buffer following the fragment, or NULL if it had no further fragments.

size\_t net\_buf\_linearize(void \*dst, size\_t dst\_len, struct [net\\_buf](#) \*src, size\_t offset, size\_t len)

Copy bytes from [net\\_buf](#) chain starting at offset to linear buffer.

Copy (extract) *len* bytes from *src* [net\\_buf](#) chain, starting from *offset* in it, to a linear buffer *dst*. Return number of bytes actually copied, which may be less than requested, if [net\\_buf](#) chain doesn't have enough data, or destination buffer is too small.

#### Parameters

- *dst* – Destination buffer
- *dst\_len* – Destination buffer length
- *src* – Source [net\\_buf](#) chain
- *offset* – Starting offset to copy from
- *len* – Number of bytes to copy

**Returns** number of bytes actually copied

size\_t net\_buf\_append\_bytes(struct [net\\_buf](#) \*buf, size\_t len, const void \*value, [k\\_timeout\\_t](#) timeout, [net\\_buf\\_allocator\\_cb](#) allocate\_cb, void \*user\_data)

Append data to a list of [net\\_buf](#).

Append data to a [net\\_buf](#). If there is not enough space in the [net\\_buf](#) then more [net\\_buf](#) will be added, unless there are no free [net\\_buf](#) and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

#### Parameters

- *buf* – Network buffer.
- *len* – Total length of input data
- *value* – Data to be added
- *timeout* – Timeout is passed to the [net\\_buf](#) allocator callback.
- *allocate\_cb* – When a new [net\\_buf](#) is required, use this callback.
- *user\_data* – A user data pointer to be supplied to the *allocate\_cb*. This pointer is can be anything from a *mem\_pool* or a [net\\_pkt](#), the logic is left up to the *allocate\_cb* function.

**Returns** Length of data actually added. This may be less than input length if other timeout than *K\_FOREVER* was used, and there were no free fragments in a pool to accommodate all data.

static inline struct [net\\_buf](#) \*net\_buf\_skip(struct [net\\_buf](#) \*buf, size\_t len)

Skip *N* number of bytes in a [net\\_buf](#).

Skip *N* number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches *N* number of bytes. Any fully skipped buffers are removed from the [net\\_buf](#) list.

#### Parameters

- *buf* – Network buffer.
- *len* – Total length of data to be skipped.

**Returns** Pointer to the fragment or NULL and *pos* is 0 after successful skip, NULL and *pos* is 0xffff otherwise.

static inline size\_t net\_buf\_fragments\_len(struct [net\\_buf](#) \*buf)

Calculate amount of bytes stored in fragments.

Calculates the total amount of data stored in the given buffer and the fragments linked to it.

#### Parameters

- `buf` – Buffer to start off with.

**Returns** Number of bytes in the buffer and its fragments.

struct `net_buf_simple`

*#include <buf.h>* Simple network buffer representation.

This is a simpler variant of the [net\\_buf](#) object (in fact [net\\_buf](#) uses [net\\_buf\\_simple](#) internally). It doesn't provide any kind of reference counting, user data, dynamic allocation, or in general the ability to pass through kernel objects such as FIFOs.

The main use of this is for scenarios where the meta-data of the normal [net\\_buf](#) isn't needed and causes too much overhead. This could be e.g. when the buffer only needs to be allocated on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

### Public Members

uint8\_t \*`data`

Pointer to the start of data in the buffer.

uint16\_t `len`

Length of the data behind the data pointer.

To determine the max length, use [net\\_buf\\_simple\\_max\\_len\(\)](#), not *size*!

uint16\_t `size`

Amount of data that `net_buf_simple::__buf` can store.

struct `net_buf_simple_state`

*#include <buf.h>* Parsing state of a buffer.

This is used for temporarily storing the parsing state of a buffer while giving control of the parsing to a routine which we don't control.

### Public Members

uint16\_t `offset`

Offset of the data pointer from the beginning of the storage

uint16\_t `len`

Length of data

struct `net_buf`

*#include <buf.h>* Network buffer representation.

This struct is used to represent network buffers. Such buffers are normally defined through the `NET_BUF_POOL_*_DEFINE()` APIs and allocated using the [net\\_buf\\_alloc\(\)](#) API.

### Public Members

sys\_snode\_t `node`

Allow placing the buffer into `sys_slist_t`

struct *net\_buf* \*frags

Fragments associated with this buffer.

uint8\_t ref

Reference count.

uint8\_t flags

Bit-field of buffer flags.

uint8\_t pool\_id

Where the buffer should go when freed up.

uint8\_t \*data

Pointer to the start of data in the buffer.

uint16\_t len

Length of the data behind the data pointer.

uint16\_t size

Amount of data that this buffer can store.

uint8\_t user\_data[0]

System metadata for this buffer.

struct net\_buf\_data\_cb

*#include <buf.h>*

struct net\_buf\_data\_alloc

*#include <buf.h>*

struct net\_buf\_pool

*#include <buf.h>* Network buffer pool representation.

This struct is used to represent a pool of network buffers.

## Public Members

struct k\_lifo free

LIFO to place the buffer into when free

const uint16\_t buf\_count

Number of buffers in pool

uint16\_t uninit\_count

Number of uninitialized buffers

void (\*const destroy)(struct *net\_buf* \*buf)

Optional destroy callback when buffer is freed.

```
const struct net_buf_data_alloc *alloc
    Data allocation handlers.
```

```
struct net_buf_pool_fixed
    #include <buf.h>
```

## Packet Management

- [Overview](#)

  - [Allocation](#)
  - [Buffer allocation](#)
  - [Deallocation](#)
- [Operations](#)
  - [Read and Write access](#)
  - [Data access](#)
- [API Reference](#)

**Overview** Network packets are the main data the networking stack manipulates. Such data is represented through the `net_pkt` structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called `net_pkt` in this document.

The data structure and the whole API around it are defined in `include/net/net_pkt.h`.

**Architectural notes** There are two network packets flows within the stack, **TX** for the transmission path, and **RX** for the reception one. In both paths, each `net_pkt` is written and read from the beginning to the end, or more specifically from the headers to the payload.

## Memory management

**Allocation** All `net_pkt` objects come from a pre-defined pool of struct `net_pkt`. Such pool is defined via `NET_PKT_SLAB_DEFINE(name, count)`

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw `net_pkt` can be done through:

```
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw `net_pkt` is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the `net_pkt` and its buffer can be allocated at once:

```
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.

**Buffer allocation** The `net_pkt` object does not define its own buffer, but instead uses an existing object for this: `net_buf`. (See [Network Buffer](#) for more information). However, it mostly hides the usage of such a buffer because `net_pkt` brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a `net_pkt` needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```

Where `proto` could be 0 if unknown (there is no `IPPROTO_UNSPEC`).

As seen previously, the `net_pkt` and its buffer can be allocated at once via `net_pkt_alloc_with_buffer()`. It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new `net_pkt` where:

```
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

```
pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 800 bytes and no extra header space. But a:

```
pkt = net_pkt_rx_alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling `net_pkt_alloc_buffer()`, as it will take into account the existing buffer. It will also account for the header space if `net_pkt`'s family is a valid one, as well as the `proto` parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

**Deallocation** Each `net_pkt` is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with `net_pkt_ref()` or decremented with `net_pkt_unref()`. When the count drops to zero the buffer is also un-referenced and `net_pkt` is automatically placed back into the free `net_pkt_slabs`

If `net_pkt`'s buffer is needed even after `net_pkt` deallocation, one will need to reference once more all the chain of `net_buf` before calling last `net_pkt_unref`. See [Network Buffer](#) for more information.

**Operations** There are two ways to access the `net_pkt` buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.

**Read and Write access** As said earlier, though `net_pkt` uses `net_buf` for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of `net_buf` objects, the functions provided by `net_buf` are then limited for such case. Instead, `net_pkt` provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each `net_pkt`. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated `net_pkt` is on write mode, and its cursor points to the beginning of its buffer.

Let's see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a `net_pkt` has 0 length, which means no valid data is in its buffer. One could verify this by:

```
len = net_pkt_get_len(pkt);
```

Now, let's write 8 bytes:

```
net_pkt_write(pkt, data, 8);
```

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian `uint16_t`, `uint32_t`.

```
net_pkt_write_u8(pkt, &foo);
net_pkt_write_be16(pkt, &ba);
net_pkt_write_be32(pkt, &bar);
```

Logically, `net_pkt`'s length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the `net_pkt`. It is possible, while in write mode, to read what has been already written by resetting the cursor of the `net_pkt`. For instance:

```
net_pkt_cursor_init(pkt);
net_pkt_read(pkt, data, 15);
```

This will reset the cursor of the `pkt` to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a `memset` function is provided:

```
net_pkt_memset(pkt, 0, 5);
```

Our `net_pkt` has now a length of 20 bytes.

Switching between modes can be achieved via `net_pkt_set_overwrite()` function. It is possible to switch mode back and forth at any time. The `net_pkt` will be set to overwrite and its cursor reset:

```
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes. If it is necessary to know how much space is available in the `net_pkt` call:

```
net_pkt_available_buffer(pkt);
```

Or, if headers space needs to be accounted for, call:

```
net_pkt_available_payload_buffer(pkt, proto);
```

If you want to place the cursor at a known position use the function `net_pkt_skip()`. For example, to go after the IP header, use:

```
net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));
```

**Data access** Though the API shown previously is rather simple, it involves always copying things to and from the `net_pkt` buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers.

These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.

There are two macros used to define a data access descriptor: `NET_PKT_DATA_ACCESS_DEFINE` when it is not possible to tell if the data will be in a contiguous area, and `NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE` when it is guaranteed the data is in a contiguous area.

Let's take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a `net_buf` of 128 bytes (for instance, though 64 bytes could be chosen).

```
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(ipv4_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *ipv4_hdr;

ipv4_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &ipv4_access);
```

It would be the same for `struct net_udp_hdr`. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_udp_hdr);
struct net_udp_hdr *udp_hdr;

udp_hdr = (struct net_udp_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the `net_pkt` points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that `net_pkt_set_data()` could be used in the RX path as well, but it is slightly faster to use `net_pkt_acknowledge_data()` as this one does not care about contiguity at all, it just advances the cursor via `net_pkt_skip()` directly.

## API Reference

group `net_pkt`

Network packet management library.

### Defines

`NET_PKT_SLAB_DEFINE(name, count)`

Create a `net_pkt` slab.

A `net_pkt` slab is used to store meta-information about network packets. It must be coupled with a data fragment pool (`:c:macro:NET_PKT_DATA_POOL_DEFINE`) used to store the actual packet data. The macro can be used by an application to define additional custom per-context TX packet slabs (see `:c:func:net_context_setup_pools`).

#### Parameters

- `name` – Name of the slab.
- `count` – Number of `net_pkt` in this slab.

`NET_PKT_TX_SLAB_DEFINE(name, count)`

`NET_PKT_DATA_POOL_DEFINE(name, count)`

Create a data fragment `net_buf` pool.

A `net_buf` pool is used to store actual data for network packets. It must be coupled with a `net_pkt` slab (`:c:macro:NET_PKT_SLAB_DEFINE`) used to store the packet meta-information. The macro can be used by an application to define additional custom per-context TX packet pools (see `:c:func:net_context_setup_pools`).

#### Parameters

- `name` – Name of the pool.
- `count` – Number of `net_buf` in this pool.

`net_pkt_print_frags(pkt)`

Print fragment list and the fragment sizes.

Only available if debugging is activated.

#### Parameters

- `pkt` – Network pkt.

`NET_PKT_DATA_ACCESS_DEFINE(_name, _type)`

`NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(_name, _type)`

### Functions

```
struct net_buf *net_pkt_get_reserve_rx_data(k_timeout_t timeout)
```

Get RX DATA buffer from pool. Normally you should use *net\_pkt\_get\_frag()* instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

#### Parameters

- *timeout* – Affects the action taken should the net buf pool be empty. If *K\_NO\_WAIT*, then return immediately. If *K\_FOREVER*, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns** Network buffer if successful, NULL otherwise.

```
struct net_buf *net_pkt_get_reserve_tx_data(k_timeout_t timeout)
```

Get TX DATA buffer from pool. Normally you should use *net\_pkt\_get\_frag()* instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

#### Parameters

- *timeout* – Affects the action taken should the net buf pool be empty. If *K\_NO\_WAIT*, then return immediately. If *K\_FOREVER*, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns** Network buffer if successful, NULL otherwise.

```
struct net_buf *net_pkt_get_frag(struct net_pkt *pkt, k_timeout_t timeout)
```

Get a data fragment that might be from user specific buffer pool or from global DATA pool.

#### Parameters

- *pkt* – Network packet.
- *timeout* – Affects the action taken should the net buf pool be empty. If *K\_NO\_WAIT*, then return immediately. If *K\_FOREVER*, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns** Network buffer if successful, NULL otherwise.

```
void net_pkt_unref(struct net_pkt *pkt)
```

Place packet back into the available packets slab.

Releases the packet to other use. This needs to be called by application after it has finished with the packet.

#### Parameters

- *pkt* – Network packet to release.

```
struct net_pkt *net_pkt_ref(struct net_pkt *pkt)
```

Increase the packet ref count.

Mark the packet to be used still.

#### Parameters

- *pkt* – Network packet to ref.

**Returns** Network packet if successful, NULL otherwise.

```
struct net_buf *net_pkt_frag_ref(struct net_buf *frag)
```

Increase the packet fragment ref count.

Mark the fragment to be used still.

#### Parameters

- *frag* – Network fragment to ref.

**Returns** a pointer on the referenced Network fragment.

void net\_pkt\_frag\_unref(struct [net\\_buf](#) \*frag)

Decrease the packet fragment ref count.

**Parameters**

- frag – Network fragment to unref.

struct [net\\_buf](#) \*net\_pkt\_frag\_del(struct [net\\_pkt](#) \*pkt, struct [net\\_buf](#) \*parent, struct [net\\_buf](#) \*frag)

Delete existing fragment from a packet.

**Parameters**

- pkt – Network packet from which frag belongs to.
- parent – parent fragment of frag, or NULL if none.
- frag – Fragment to delete.

**Returns** Pointer to the following fragment, or NULL if it had no further fragments.

void net\_pkt\_frag\_add(struct [net\\_pkt](#) \*pkt, struct [net\\_buf](#) \*frag)

Add a fragment to a packet at the end of its fragment list.

**Parameters**

- pkt – pkt Network packet where to add the fragment
- frag – Fragment to add

void net\_pkt\_frag\_insert(struct [net\\_pkt](#) \*pkt, struct [net\\_buf](#) \*frag)

Insert a fragment to a packet at the beginning of its fragment list.

**Parameters**

- pkt – pkt Network packet where to insert the fragment
- frag – Fragment to insert

bool net\_pkt\_compact(struct [net\\_pkt](#) \*pkt)

Compact the fragment list of a packet.

After this there is no more any free space in individual fragments.

**Parameters**

- pkt – Network packet.

**Returns** True if compact success, False otherwise.

void net\_pkt\_get\_info(struct k\_mem\_slab \*\*rx, struct k\_mem\_slab \*\*tx, struct [net\\_buf\\_pool](#) \*\*rx\_data, struct [net\\_buf\\_pool](#) \*\*tx\_data)

Get information about predefined RX, TX and DATA pools.

**Parameters**

- rx – Pointer to RX pool is returned.
- tx – Pointer to TX pool is returned.
- rx\_data – Pointer to RX DATA pool is returned.
- tx\_data – Pointer to TX DATA pool is returned.

struct [net\\_pkt](#) \*net\_pkt\_alloc([k\\_timeout\\_t](#) timeout)

Allocate an initialized [net\\_pkt](#).

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

**Parameters**

- timeout – Maximum time to wait for an allocation.

**Returns** a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```
struct net_pkt *net_pkt_alloc_from_slab(struct k_mem_slab *slab, k_timeout_t timeout)
```

Allocate an initialized `net_pkt` from a specific slab.

unlike `net_pkt_alloc()` which uses core slabs, this one will use an external slab (see `NET_PKT_SLAB_DEFINE()`). Do not use it unless you know what you are doing. Basically, only `net_context` should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

**Parameters**

- slab – The slab to use for allocating the packet
- timeout – Maximum time to wait for an allocation.

**Returns** a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```
struct net_pkt *net_pkt_rx_alloc(k_timeout_t timeout)
```

Allocate an initialized `net_pkt` for RX.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

**Parameters**

- timeout – Maximum time to wait for an allocation.

**Returns** a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```
struct net_pkt *net_pkt_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)
```

Allocate a network packet for a specific network interface.

**Parameters**

- iface – The network interface the packet is supposed to go through.
- timeout – Maximum time to wait for an allocation.

**Returns** a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```
struct net_pkt *net_pkt_rx_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)
```

```
int net_pkt_alloc_buffer(struct net_pkt *pkt, size_t size, enum net_ip_protocol proto, k_timeout_t timeout)
```

Allocate buffer for a `net_pkt`.

: such allocator will take into account space necessary for headers, MTU, and existing buffer (if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than requested one.

**Parameters**

- pkt – The network packet requiring buffer to be allocated.
- size – The size of buffer being requested.
- proto – The IP protocol type (can be 0 for none).
- timeout – Maximum time to wait for an allocation.

**Returns** 0 on success, negative errno code otherwise.

```
struct net_pkt *net_pkt_alloc_with_buffer(struct net_if *iface, size_t size, sa_family_t family, enum net_ip_protocol proto, k_timeout_t timeout)
```

Allocate a network packet and buffer at once.

**Parameters**

- `iface` – The network interface the packet is supposed to go through.
- `size` – The size of buffer.
- `family` – The family to which the packet belongs.
- `proto` – The IP protocol type (can be 0 for none).
- `timeout` – Maximum time to wait for an allocation.

**Returns** a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```
struct net_pkt *net_pkt_rx_alloc_with_buffer(struct net_if *iface, size_t size, sa_family_t
                                             family, enum net_ip_protocol proto, k_timeout_t
                                             timeout)
```

```
void net_pkt_append_buffer(struct net_pkt *pkt, struct net_buf *buffer)
```

Append a buffer in packet.

**Parameters**

- `pkt` – Network packet where to append the buffer
- `buffer` – Buffer to append

```
size_t net_pkt_available_buffer(struct net_pkt *pkt)
```

Get available buffer space from a pkt.

---

**Note:** Reserved bytes (headroom) in any of the fragments are not considered to be available.

---

**Parameters**

- `pkt` – The `net_pkt` which buffer availability should be evaluated

**Returns** the amount of buffer available

```
size_t net_pkt_available_payload_buffer(struct net_pkt *pkt, enum net_ip_protocol proto)
```

Get available buffer space for payload from a pkt.

Unlike `net_pkt_available_buffer()`, this will take into account the headers space.

---

**Note:** Reserved bytes (headroom) in any of the fragments are not considered to be available.

---

**Parameters**

- `pkt` – The `net_pkt` which payload buffer availability should be evaluated
- `proto` – The IP protocol type (can be 0 for none).

**Returns** the amount of buffer available for payload

```
void net_pkt_trim_buffer(struct net_pkt *pkt)
```

Trim `net_pkt` buffer.

This will basically check for unused buffers and deallocates them relevantly

**Parameters**

- `pkt` – The `net_pkt` which buffer will be trimmed

```
int net_pkt_remove_tail(struct net_pkt *pkt, size_t length)
```

Remove *length* bytes from tail of packet.

This function does not take packet cursor into account. It is a helper to remove unneeded bytes from tail of packet (like appended CRC). It takes care of buffer deallocation if removed bytes span whole buffer(s).

#### Parameters

- *pkt* – Network packet
- *length* – Number of bytes to be removed

#### Return values

- 0 – On success.
- -EINVAL – If packet length is shorter than *length*.

```
void net_pkt_cursor_init(struct net_pkt *pkt)
```

Initialize *net\_pkt* cursor.

This will initialize the *net\_pkt* cursor from its buffer.

#### Parameters

- *pkt* – The *net\_pkt* whose cursor is going to be initialized

```
static inline void net_pkt_cursor_backup(struct net_pkt *pkt, struct net_pkt_cursor *backup)
```

Backup *net\_pkt* cursor.

#### Parameters

- *pkt* – The *net\_pkt* whose cursor is going to be backed up
- *backup* – The cursor where to backup *net\_pkt* cursor

```
static inline void net_pkt_cursor_restore(struct net_pkt *pkt, struct net_pkt_cursor *backup)
```

Restore *net\_pkt* cursor from a backup.

#### Parameters

- *pkt* – The *net\_pkt* whose cursor is going to be restored
- *backup* – The cursor from where to restore *net\_pkt* cursor

```
static inline void *net_pkt_cursor_get_pos(struct net_pkt *pkt)
```

Returns current position of the cursor.

#### Parameters

- *pkt* – The *net\_pkt* whose cursor position is going to be returned

#### Returns

cursor's position

```
int net_pkt_skip(struct net_pkt *pkt, size_t length)
```

Skip some data from a *net\_pkt*.

*net\_pkt*'s cursor should be properly initialized. Cursor position will be updated after the operation. Depending on the value of *pkt->overwrite* bit, this function will affect the buffer length or not. If it's true, it will advance the cursor to the requested length. If it's false, it will do the same but if the cursor was already also at the end of existing data, it will increment the buffer length. So in this case, its behavior is just like *net\_pkt\_write* or *net\_pkt\_memset*, difference being that it will not affect the buffer content itself (which may be just garbage then).

#### Parameters

- *pkt* – The *net\_pkt* whose cursor will be updated to skip given amount of data from the buffer.
- *length* – Amount of data to skip in the buffer

**Returns** 0 in success, negative errno code otherwise.

int net\_pkt\_memset(struct [net\\_pkt](#) \*pkt, int byte, size\_t length)

Memset some data in a [net\\_pkt](#).

[net\\_pkt](#)'s cursor should be properly initialized and, if needed, positioned using net\_pkt\_skip. Cursor position will be updated after the operation.

#### Parameters

- pkt – The [net\\_pkt](#) whose buffer to fill starting at the current cursor position.
- byte – The byte to write in memory
- length – Amount of data to memset with given byte

**Returns** 0 in success, negative errno code otherwise.

int net\_pkt\_copy(struct [net\\_pkt](#) \*pkt\_dst, struct [net\\_pkt](#) \*pkt\_src, size\_t length)

Copy data from a packet into another one.

Both [net\\_pkt](#) cursors should be properly initialized and, if needed, positioned using net\_pkt\_skip. The cursors will be updated after the operation.

#### Parameters

- pkt\_dst – Destination network packet.
- pkt\_src – Source network packet.
- length – Length of data to be copied.

**Returns** 0 on success, negative errno code otherwise.

struct [net\\_pkt](#) \*net\_pkt\_clone(struct [net\\_pkt](#) \*pkt, [k\\_timeout\\_t](#) timeout)

Clone pkt and its buffer.

#### Parameters

- pkt – Original pkt to be cloned
- timeout – Timeout to wait for free buffer

**Returns** NULL if error, cloned packet otherwise.

struct [net\\_pkt](#) \*net\_pkt\_shallow\_clone(struct [net\\_pkt](#) \*pkt, [k\\_timeout\\_t](#) timeout)

Clone pkt and increase the refcount of its buffer.

#### Parameters

- pkt – Original pkt to be shallow cloned
- timeout – Timeout to wait for free packet

**Returns** NULL if error, cloned packet otherwise.

int net\_pkt\_read(struct [net\\_pkt](#) \*pkt, void \*data, size\_t length)

Read some data from a [net\\_pkt](#).

[net\\_pkt](#)'s cursor should be properly initialized and, if needed, positioned using net\_pkt\_skip. Cursor position will be updated after the operation.

#### Parameters

- pkt – The network packet from where to read some data
- data – The destination buffer where to copy the data
- length – The amount of data to copy

**Returns** 0 on success, negative errno code otherwise.

```
static inline int net_pkt_read_u8(struct net_pkt *pkt, uint8_t *data)
```

```
int net_pkt_read_be16(struct net_pkt *pkt, uint16_t *data)
```

Read uint16\_t big endian data from a *net\_pkt*.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

**Parameters**

- `pkt` – The network packet from where to read
- `data` – The destination uint16\_t where to copy the data

**Returns** 0 on success, negative errno code otherwise.

```
int net_pkt_read_le16(struct net_pkt *pkt, uint16_t *data)
```

Read uint16\_t little endian data from a *net\_pkt*.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

**Parameters**

- `pkt` – The network packet from where to read
- `data` – The destination uint16\_t where to copy the data

**Returns** 0 on success, negative errno code otherwise.

```
int net_pkt_read_be32(struct net_pkt *pkt, uint32_t *data)
```

Read uint32\_t big endian data from a *net\_pkt*.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

**Parameters**

- `pkt` – The network packet from where to read
- `data` – The destination uint32\_t where to copy the data

**Returns** 0 on success, negative errno code otherwise.

```
int net_pkt_write(struct net_pkt *pkt, const void *data, size_t length)
```

Write data into a *net\_pkt*.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

**Parameters**

- `pkt` – The network packet where to write
- `data` – Data to be written
- `length` – Length of the data to be written

**Returns** 0 on success, negative errno code otherwise.

```
static inline int net_pkt_write_u8(struct net_pkt *pkt, uint8_t data)
```

```
static inline int net_pkt_write_be16(struct net_pkt *pkt, uint16_t data)
```

```
static inline int net_pkt_write_be32(struct net_pkt *pkt, uint32_t data)
```

```
static inline int net_pkt_write_le32(struct net_pkt *pkt, uint32_t data)
```

```
static inline int net_pkt_write_le16(struct net_pkt *pkt, uint16_t data)
```

size\_t net\_pkt\_remaining\_data(struct *net\_pkt* \*pkt)

Get the amount of data which can be read from current cursor position.

**Parameters**

- pkt – Network packet

**Returns** Amount of data which can be read from current pkt cursor

int net\_pkt\_update\_length(struct *net\_pkt* \*pkt, size\_t length)

Update the overall length of a packet.

Unlike *net\_pkt\_pull()* below, this does not take packet cursor into account. It's mainly a helper dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by given parameter.

**Parameters**

- pkt – Network packet
- length – The new length of the packet

**Returns** 0 on success, negative errno code otherwise.

int net\_pkt\_pull(struct *net\_pkt* \*pkt, size\_t length)

Remove data from the packet at current location.

*net\_pkt*'s cursor should be properly initialized and, eventually, properly positioned using *net\_pkt\_skip/read/write*. Note that *net\_pkt*'s cursor is reset by this function.

**Parameters**

- pkt – Network packet
- length – Number of bytes to be removed

**Returns** 0 on success, negative errno code otherwise.

uint16\_t net\_pkt\_get\_current\_offset(struct *net\_pkt* \*pkt)

Get the actual offset in the packet from its cursor.

**Parameters**

- pkt – Network packet.

**Returns** a valid offset on success, 0 otherwise as there is nothing that can be done to evaluate the offset.

bool net\_pkt\_is\_contiguous(struct *net\_pkt* \*pkt, size\_t size)

Check if a data size could fit contiguously.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using *net\_pkt\_skip*.

**Parameters**

- pkt – Network packet.
- size – The size to check for contiguity

**Returns** true if that is the case, false otherwise.

size\_t net\_pkt\_get\_contiguous\_len(struct *net\_pkt* \*pkt)

Get the contiguous buffer space

**Parameters**

- pkt – Network packet

**Returns** The available contiguous buffer space in bytes starting from the current cursor position. 0 in case of an error.

```
void *net_pkt_get_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
```

Get data from a network packet in a contiguous way.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

#### Parameters

- `pkt` – The network packet from where to get the data.
- `access` – A pointer to a valid *net\_pkt\_data\_access* describing the data to get in a contiguous way.

**Returns** a pointer to the requested contiguous data, NULL otherwise.

```
int net_pkt_set_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
```

Set contiguous data into a network packet.

*net\_pkt*'s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

#### Parameters

- `pkt` – The network packet to where the data should be set.
- `access` – A pointer to a valid *net\_pkt\_data\_access* describing the data to set.

**Returns** 0 on success, a negative `errno` otherwise.

```
static inline int net_pkt_acknowledge_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
```

Acknowledge previously contiguous data taken from a network packet. Packet needs to be set to overwrite mode.

```
struct net_pkt_cursor  
#include <net_pkt.h>
```

#### Public Members

```
struct net_buf *buf  
Current net_buf pointer by the cursor
```

```
uint8_t *pos  
Current position in the data buffer of the net_buf
```

```
struct net_pkt  
#include <net_pkt.h> Network packet.  
Note that if you add new fields into net_pkt, remember to update net_pkt_clone() function.
```

#### Public Members

```
intptr_t fifo  
The fifo is used by RX/TX threads and by socket layer. The net_pkt is queued via fifo to the processing thread.
```

```
struct k_mem_slab *slab  
Slab pointer from where it belongs to
```

union [net\\_pkt](#).[anonymous] [anonymous]  
buffer holding the packet

struct [net\\_pkt\\_cursor](#) cursor  
Internal buffer iterator used for reading/writing

struct net\_context \*context  
Network connection context

struct [net\\_if](#) \*iface  
Network interface

struct net\_pkt\_data\_access  
*#include <net\_pkt.h>*

## 7.20.3 Networking Technologies

### Ethernet

- [Overview](#)
- [API Reference](#)

### Virtual LAN (VLAN) Support

- [Overview](#)
- [API Reference](#)

**Overview** Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to [IEEE 802.1Q](#)

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The *eth0* is the real network interface and *vlan0* is a virtual network interface that is run on top of *eth0*.

VLAN support must be enabled at compile time by setting option **:kconfig: `CONFIG\_NET\_VLAN`** and **:kconfig: `CONFIG\_NET\_VLAN\_COUNT`** to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the **:kconfig: `CONFIG\_NET\_VLAN\_COUNT`** option should be set to 3.

Even if VLAN is enabled in a `prj.conf` file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a [net\\_eth\\_vlan\\_enable\(\)](#) function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a [net\\_eth\\_vlan\\_disable\(\)](#) function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at [samples/net/vlan](#).

The net-shell module contains *net vlan add* and *net vlan del* commands that can be used to enable or disable VLAN tags for a given network interface.

See the [IEEE 802.1Q spec](#) for more information about ethernet VLANs.

## API Reference

*group* `vlan_api`

VLAN definitions and helpers.

### Defines

`NET_VLAN_TAG_UNSPEC`

Unspecified VLAN tag value

### Functions

`static inline uint16_t net_eth_vlan_get_vid(uint16_t tci)`

Get VLAN identifier from TCI.

#### Parameters

- `tci` – VLAN tag control information.

**Returns** VLAN identifier.

`static inline uint8_t net_eth_vlan_get_dei(uint16_t tci)`

Get Drop Eligible Indicator from TCI.

#### Parameters

- `tci` – VLAN tag control information.

**Returns** Drop eligible indicator.

`static inline uint8_t net_eth_vlan_get_pcp(uint16_t tci)`

Get Priority Code Point from TCI.

#### Parameters

- `tci` – VLAN tag control information.

**Returns** Priority code point.

`static inline uint16_t net_eth_vlan_set_vid(uint16_t tci, uint16_t vid)`

Set VLAN identifier to TCI.

#### Parameters

- `tci` – VLAN tag control information.
- `vid` – VLAN identifier.

**Returns** New TCI value.

`static inline uint16_t net_eth_vlan_set_dei(uint16_t tci, bool dei)`

Set Drop Eligible Indicator to TCI.

#### Parameters

- `tci` – VLAN tag control information.
- `dei` – Drop eligible indicator.

**Returns** New TCI value.

```
static inline uint16_t net_eth_vlan_set_pcp(uint16_t tci, uint8_t pcp)
```

Set Priority Code Point to TCI.

**Parameters**

- `tci` – VLAN tag control information.
- `pcp` – Priority code point.

**Returns** New TCI value.

## Link Layer Discovery Protocol

- [Overview](#)
- [API Reference](#)

**Overview** The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network.

For more information, see this [LLDP Wikipedia article](#).

## API Reference

*group* lldp

LLDP definitions and helpers.

### Defines

```
net_lldp_set_lldpdu(iface)
```

Set LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**

- `iface` – Network interface

**Returns** <0 if error, index in lldp array if iface is found there

```
net_lldp_unset_lldpdu(iface)
```

Unset LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**

- `iface` – Network interface

### Typedefs

```
typedef enum net\_verdict (*net_lldp_rcv_cb_t)(struct net\_if *iface, struct net\_pkt *pkt)
```

LLDP Receive packet callback.

Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct `net_verdict`.

Returns:

- `NET_DROP`, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.

- NET\_OK, if the packet was accepted, in this case the ownership of the `net_pkt` goes to callback and core network stack will forget it.

## Enums

enum net\_lldp\_tlv\_type

TLV Types. Please refer to table 8-1 from IEEE 802.1AB standard.

*Values:*

enumerator LLDP\_TLV\_END\_LLDPDU = 0

End Of LLDPDU (optional)

enumerator LLDP\_TLV\_CHASSIS\_ID = 1

Chassis ID (mandatory)

enumerator LLDP\_TLV\_PORT\_ID = 2

Port ID (mandatory)

enumerator LLDP\_TLV\_TTL = 3

Time To Live (mandatory)

enumerator LLDP\_TLV\_PORT\_DESC = 4

Port Description (optional)

enumerator LLDP\_TLV\_SYSTEM\_NAME = 5

System Name (optional)

enumerator LLDP\_TLV\_SYSTEM\_DESC = 6

System Description (optional)

enumerator LLDP\_TLV\_SYSTEM\_CAPABILITIES = 7

System Capability (optional)

enumerator LLDP\_TLV\_MANAGEMENT\_ADDR = 8

Management Address (optional)

enumerator LLDP\_TLV\_ORG\_SPECIFIC = 127

Org specific TLVs (optional)

## Functions

int net\_lldp\_config(struct `net_if` \*iface, const struct `net_lldpdu` \*lldpdu)

Set the LLDP data unit for a network interface.

### Parameters

- `iface` – Network interface
- `lldpdu` – LLDP data unit struct

**Returns** 0 if ok, <0 if error

```
int net_lldp_config_optional(struct net\_if *iface, const uint8_t *tlv, size_t len)
```

Set the Optional LLDP TLVs for a network interface.

#### Parameters

- `iface` – Network interface
- `tlv` – LLDP optional TLVs following mandatory part
- `len` – Length of the optional TLVs

**Returns** 0 if ok, <0 if error

```
void net_lldp_init(void)
```

Initialize LLDP engine.

```
int net_lldp_register_callback(struct net\_if *iface, net\_lldp\_rcv\_cb\_t cb)
```

Register LLDP Rx callback function.

#### Parameters

- `iface` – Network interface
- `cb` – Callback function

**Returns** 0 if ok, < 0 if error

```
enum net\_verdict net_lldp_rcv(struct net\_if *iface, struct net\_pkt *pkt)
```

Parse LLDP packet.

#### Parameters

- `iface` – Network interface
- `pkt` – Network packet

**Returns** Return the policy for network buffer

```
struct net_lldp_chassis_tlv
```

*#include <lldp.h>* Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB

#### Public Members

```
uint16_t type_length
```

7 bits for type, 9 bits for length

```
uint8_t subtype
```

ID subtype

```
uint8_t value[NET_LLDP_CHASSIS_ID_VALUE_LEN]
```

Chassis ID value

```
struct net_lldp_port_tlv
```

*#include <lldp.h>* Port ID TLV, see chapter 8.5.3 in IEEE 802.1AB

#### Public Members

```
uint16_t type_length
```

7 bits for type, 9 bits for length

uint8\_t subtype

ID subtype

uint8\_t value[NET\_LLDP\_PORT\_ID\_VALUE\_LEN]

Port ID value

struct net\_lldp\_time\_to\_live\_tlv

*#include <lldp.h>* Time To Live TLV, see chapter 8.5.4 in IEEE 802.1AB

### Public Members

uint16\_t type\_length

7 bits for type, 9 bits for length

uint16\_t ttl

Time To Live (TTL) value

struct net\_lldpdu

*#include <lldp.h>* LLDP Data Unit (LLDPDU) shall contain the following ordered TLVs as stated in “8.2 LLDPDU format” from the IEEE 802.1AB

### Public Members

struct [net\\_lldp\\_chassis\\_tlv](#) chassis\_id

Mandatory Chassis TLV

struct [net\\_lldp\\_port\\_tlv](#) port\_id

Mandatory Port TLV

struct [net\\_lldp\\_time\\_to\\_live\\_tlv](#) ttl

Mandatory TTL TLV

## IEEE 802.1Qav

**Overview** Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the [IEEE 802.1Qav-2009 standard](#). Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.

**Enabling 802.1Qav** To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver’s capability function must return ETHERNET\_QAV value for this purpose. Typically also priority queues ETHERNET\_PRIORITY\_QUEUES need to be supported.

```
static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev)
{
    ARG_UNUSED(dev);
```

(continues on next page)

(continued from previous page)

```

    return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
           ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
           ETHERNET_LINK_100BASE_T;
}

```

See sam-e70-xplained board Ethernet driver `drivers/ethernet/eth_sam_gmac.c` for an example.

**Configuring 802.1Qav** The application can configure the credit-based shaper like this:

```

#include <net/net_if.h>
#include <net/ethernet.h>
#include <net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
                          int queue_id, bool enable)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.enabled = enable;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_STATUS;

    /* Disable or enable Qav for a queue */
    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                  iface, &params,
                  sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot %s Qav for queue %d for interface %p",
                enable ? "enable" : "disable",
                queue_id, iface);
    }
}

static void qav_set_bandwidth_and_slope(struct net_if *iface,
                                        int queue_id,
                                        unsigned int bandwidth,
                                        unsigned int idle_slope)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.delta_bandwidth = bandwidth;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_DELTA_BANDWIDTH;

    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                  iface, &params,
                  sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot set Qav delta bandwidth %u for "
                "queue %d for interface %p",

```

(continues on next page)

(continued from previous page)

```

        bandwidth, queue_id, iface);
    }

    params.qav_param.idle_slope = idle_slope;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_IDLE_SLOPE;

    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                  iface, &params,
                  sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot set Qav idle slope %u for "
               "queue %d for interface %p",
               idle_slope, queue_id, iface);
    }
}

```

**Overview** Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this [Ethernet Wikipedia article](#).

Zephyr supports following Ethernet features:

- 10, 100 and 1000 Mbit/sec links
- Auto negotiation
- Half/full duplex
- Promiscuous mode
- TX and RX checksum offloading
- MAC address filtering
- *Virtual LANs*
- *Priority queues*
- *IEEE 802.1AS (gPTP)*
- *IEEE 802.1Qav (credit based shaping)*
- *LLDP (Link Layer Discovery Protocol)*

Not all Ethernet device drivers support all of these features. You can see what is supported by `net iface` net-shell command. It will print currently supported Ethernet features.

## API Reference

*group* ethernet

Ethernet support functions.

## Defines

`ETH_NET_DEVICE_INIT(dev_name, drv_name, init_fn, pm_control_fn, data, cfg, prio, api, mtu)`  
Create an Ethernet network interface and bind it to network device.

### Parameters

- `dev_name` – Network device name.
- `drv_name` – The name this instance of the driver exposes to the system.

- `init_fn` – Address to the init function of the driver.
- `pm_control_fn` – Pointer to `pm_control` function. Can be NULL if not implemented.
- `data` – Pointer to the device's private data.
- `cfg` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`ETH_NET_DEVICE_DT_DEFINE(node_id, init_fn, pm_control_fn, data, cfg, prio, api, mtu)`

Like `ETH_NET_DEVICE_INIT` but taking metadata from a devicetree. Create an Ethernet network interface and bind it to network device.

#### Parameters

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm_control_fn` – Pointer to `pm_control` function. Can be NULL if not implemented.
- `data` – Pointer to the device's private data.
- `cfg` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`ETH_NET_DEVICE_DT_INST_DEFINE(inst, ...)`

Like `ETH_NET_DEVICE_DT_DEFINE` for an instance of a `DT_DRV_COMPAT` compatible.

#### Parameters

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `ETH_NET_DEVICE_DT_DEFINE`.
- `...` – other parameters as expected by `ETH_NET_DEVICE_DT_DEFINE`.

## Enums

`enum ethernet_hw_caps`

Ethernet hardware capabilities

*Values:*

enumerator `ETHERNET_HW_TX_CHKSUM_OFFLOAD` = [\*BIT\*\(0\)](#)

TX Checksum offloading supported for all of IPv4, UDP, TCP

enumerator `ETHERNET_HW_RX_CHKSUM_OFFLOAD` = [\*BIT\*\(1\)](#)

RX Checksum offloading supported for all of IPv4, UDP, TCP

enumerator ETHERNET\_HW\_VLAN = *BIT*(2)  
VLAN supported

enumerator ETHERNET\_AUTO\_NEGOTIATION\_SET = *BIT*(3)  
Enabling/disabling auto negotiation supported

enumerator ETHERNET\_LINK\_10BASE\_T = *BIT*(4)  
10 Mbits link supported

enumerator ETHERNET\_LINK\_100BASE\_T = *BIT*(5)  
100 Mbits link supported

enumerator ETHERNET\_LINK\_1000BASE\_T = *BIT*(6)  
1 Gbits link supported

enumerator ETHERNET\_DUPLEX\_SET = *BIT*(7)  
Changing duplex (half/full) supported

IEEE 802.1AS (gPTP) clock supported

enumerator ETHERNET\_QAV = *BIT*(9)  
IEEE 802.1Qav (credit-based shaping) supported

enumerator ETHERNET\_PROMISC\_MODE = *BIT*(10)  
Promiscuous mode supported

enumerator ETHERNET\_PRIORITY\_QUEUES = *BIT*(11)  
Priority queues available

enumerator ETHERNET\_HW\_FILTERING = *BIT*(12)  
MAC address filtering supported

enumerator ETHERNET\_LLDP = *BIT*(13)  
Link Layer Discovery Protocol supported

enumerator ETHERNET\_HW\_VLAN\_TAG\_STRIP = *BIT*(14)  
VLAN Tag stripping

enumerator ETHERNET\_DSA\_SLAVE\_PORT = *BIT*(15)  
DSA switch

enumerator ETHERNET\_DSA\_MASTER\_PORT = *BIT*(16)

enumerator ETHERNET\_QBV = *BIT*(17)  
IEEE 802.1Qbv (scheduled traffic) supported

enumerator ETHERNET\_QBU = *BIT*(18)  
IEEE 802.1Qbu (frame preemption) supported

enumerator ETHERNET\_TXTIME = *BIT*(19)

    TXTIME supported

enum ethernet\_flags

*Values:*

enumerator ETH\_CARRIER\_UP

## Functions

void ethernet\_init(struct *net\_if* \*iface)

    Initialize Ethernet L2 stack for a given interface.

### Parameters

- *iface* – A valid pointer to a network interface

void net\_eth\_ipv6\_mcast\_to\_mac\_addr(const struct *in6\_addr* \*ipv6\_addr, struct net\_eth\_addr \*mac\_addr)

    Convert IPv6 multicast address to Ethernet address.

### Parameters

- *ipv6\_addr* – IPv6 multicast address
- *mac\_addr* – Output buffer for Ethernet address

static inline enum *ethernet\_hw\_caps* net\_eth\_get\_hw\_capabilities(struct *net\_if* \*iface)

    Return ethernet device hardware capability information.

### Parameters

- *iface* – Network interface

**Returns** Hardware capabilities

static inline int net\_eth\_vlan\_enable(struct *net\_if* \*iface, uint16\_t tag)

    Add VLAN tag to the interface.

### Parameters

- *iface* – Interface to use.
- *tag* – VLAN tag to add

**Returns** 0 if ok, <0 if error

static inline int net\_eth\_vlan\_disable(struct *net\_if* \*iface, uint16\_t tag)

    Remove VLAN tag from the interface.

### Parameters

- *iface* – Interface to use.
- *tag* – VLAN tag to remove

**Returns** 0 if ok, <0 if error

static inline uint16\_t net\_eth\_get\_vlan\_tag(struct *net\_if* \*iface)

    Return VLAN tag specified to network interface.

### Parameters

- *iface* – Network interface.

**Returns** VLAN tag for this interface or NET\_VLAN\_TAG\_UNSPEC if VLAN is not configured for that interface.

```
static inline struct net_if *net_eth_get_vlan_iface(struct net_if *iface, uint16_t tag)
```

Return network interface related to this VLAN tag.

#### Parameters

- *iface* – Master network interface. This is used to get the pointer to ethernet L2 context
- *tag* – VLAN tag

**Returns** Network interface related to this tag or NULL if no such interface exists.

```
static inline bool net_eth_is_vlan_enabled(struct ethernet_context *ctx, struct net_if *iface)
```

Check if VLAN is enabled for a specific network interface.

#### Parameters

- *ctx* – Ethernet context
- *iface* – Network interface

**Returns** True if VLAN is enabled for this network interface, false if not.

```
static inline bool net_eth_get_vlan_status(struct net_if *iface)
```

Get VLAN status for a given network interface (enabled or not).

#### Parameters

- *iface* – Network interface

**Returns** True if VLAN is enabled for this network interface, false if not.

```
void net_eth_carrier_on(struct net_if *iface)
```

Inform ethernet L2 driver that ethernet carrier is detected. This happens when cable is connected.

#### Parameters

- *iface* – Network interface

```
void net_eth_carrier_off(struct net_if *iface)
```

Inform ethernet L2 driver that ethernet carrier was lost. This happens when cable is disconnected.

#### Parameters

- *iface* – Network interface

```
int net_eth_promisc_mode(struct net_if *iface, bool enable)
```

Set promiscuous mode either ON or OFF.

#### Parameters

- *iface* – Network interface
- *enable* – on (true) or off (false)

**Returns** 0 if mode set or unset was successful, <0 otherwise.

```
static inline const struct device *net_eth_get_ptp_clock(struct net_if *iface)
```

Return PTP clock that is tied to this ethernet network interface.

#### Parameters

- *iface* – Network interface

**Returns** Pointer to PTP clock if found, NULL if not found or if this ethernet interface does not support PTP.

```
const struct device *net_eth_get_ptp_clock_by_index(int index)
```

Return PTP clock that is tied to this ethernet network interface index.

**Parameters**

- `index` – Network interface index

**Returns** Pointer to PTP clock if found, NULL if not found or if this ethernet interface index does not support PTP.

```
static inline int net_eth_get_ptp_port(struct net_if *iface)
```

Return gPTP port number attached to this interface.

**Parameters**

- `iface` – Network interface

**Returns** Port number, no such port if `< 0`

```
struct ethernet_qav_param
```

```
#include <ethernet.h>
```

**Public Members**

```
int queue_id
```

ID of the priority queue to use

```
enum ethernet_qav_param_type type
```

Type of Qav parameter

```
bool enabled
```

True if Qav is enabled for queue

```
unsigned int delta_bandwidth
```

Delta Bandwidth (percentage of bandwidth)

```
unsigned int idle_slope
```

Idle Slope (bits per second)

```
unsigned int oper_idle_slope
```

Oper Idle Slope (bits per second)

```
unsigned int traffic_class
```

Traffic class the queue is bound to

```
struct ethernet_qbv_param
```

```
#include <ethernet.h>
```

**Public Members**

```
int port_id
```

Port id

enum ethernet\_qbv\_param\_type type

Type of Qbv parameter

enum ethernet\_qbv\_state\_type state

What state (Admin/Oper) parameters are these

bool enabled

True if Qbv is enabled or not

bool gate\_status[NET\_TC\_TX\_COUNT]

True = open, False = closed

enum ethernet\_gate\_state\_operation operation

GateState operation

uint32\_t time\_interval

Time interval ticks (nanoseconds)

uint16\_t row

Gate control list row

uint32\_t gate\_control\_list\_len

Number of entries in gate control list

struct [net\\_ptp\\_extended\\_time](#) base\_time

Base time

struct [net\\_ptp\\_time](#) cycle\_time

Cycle time

uint32\_t extension\_time

Extension time (nanoseconds)

struct ethernet\_qbu\_param

*#include <ethernet.h>*

### Public Members

int port\_id

Port id

enum ethernet\_qbu\_param\_type type

Type of Qbu parameter

uint32\_t hold\_advance

Hold advance (nanoseconds)

uint32\_t release\_advance  
Release advance (nanoseconds)

enum ethernet\_qbu\_preempt\_status frame\_preempt\_statuses[NET\_TC\_TX\_COUNT]  
sequence of framePreemptionAdminStatus values.

bool enabled  
True if Qbu is enabled or not

bool link\_partner\_status  
Link partner status (from Qbr)

uint8\_t additional\_fragment\_size  
Additional fragment size (from Qbr). The minimum non-final fragment size is (additional\_fragment\_size + 1) \* 64 octets

struct ethernet\_filter  
*#include <ethernet.h>*

### Public Members

enum ethernet\_filter\_type type  
Type of filter

struct net\_eth\_addr mac\_address  
MAC address to filter

bool set  
Set (true) or unset (false) the filter

struct ethernet\_txtime\_param  
*#include <ethernet.h>*

### Public Members

enum ethernet\_txtime\_param\_type type  
Type of TXTIME parameter

int queue\_id  
Queue number for configuring TXTIME

bool enable\_txtime  
Enable or disable TXTIME per queue

struct ethernet\_api  
*#include <ethernet.h>*

## Public Members

struct net\_if\_api iface\_api

The net\_if\_api must be placed in first position in this struct so that we are compatible with network interface API.

int (\*start)(const struct *device* \*dev)

Start the device

int (\*stop)(const struct *device* \*dev)

Stop the device

enum *ethernet\_hw\_caps* (\*get\_capabilities)(const struct *device* \*dev)

Get the device capabilities

int (\*set\_config)(const struct *device* \*dev, enum ethernet\_config\_type type, const struct ethernet\_config \*config)

Set specific hardware configuration

int (\*get\_config)(const struct *device* \*dev, enum ethernet\_config\_type type, struct ethernet\_config \*config)

Get hardware specific configuration

int (\*send)(const struct *device* \*dev, struct *net\_pkt* \*pkt)

Send a network packet

struct ethernet\_context

*#include <ethernet.h>* Ethernet L2 context that is needed for VLAN

## Public Members

atomic\_t flags

Flags representing ethernet state, which are accessed from multiple threads.

struct *k\_work* carrier\_work

Carrier ON/OFF handler worker. This is used to create network interface UP/DOWN event when ethernet L2 driver notices carrier ON/OFF situation. We must not create another network management event from inside management handler thus we use worker thread to trigger the UP/DOWN event.

struct *net\_if* \*iface

Network interface.

enum *net\_l2\_flags* ethernet\_l2\_flags

This tells what L2 features does ethernet support.

bool is\_net\_carrier\_up

Is network carrier up

`bool is_init`

Is this context already initialized

*group* `ethernet_mii`

Ethernet MII (media independent interface) functions.

## Defines

`MII_BMCR`

try for 100BASE-X support

`MII_ADVERTISE_10_FULL`  
try for 10 Mb/s full duplex support

`MII_ADVERTISE_10_HALF`  
try for 10 Mb/s half duplex support

`MII_ADVERTISE_SEL_MASK`  
Selector Field

`MII_ADVERTISE_SEL_IEEE_802_3`

`MII_ADVERTISE_ALL`

## IEEE 802.15.4

- [Overview](#)
- [API Reference](#)
  - [IEEE 802.15.4](#)
  - [IEEE 802.15.4 Management](#)

**Overview** IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For more detailed overview of this standard, see this [IEEE 802.15.4 Wikipedia article](#). Also, see [IEEE GET Program](#) for creating an IEEE account and downloading the specification.

Zephyr supports IEEE 802.15.4 with Thread and 6LoWPAN. The Thread implementation is based on [OpenThread](#). The IPv6 header compression in 6LoWPAN is shared with the Bluetooth IPSP (IP support profile).

## API Reference

### IEEE 802.15.4

`group ieee802154`

IEEE 802.15.4 library.

## Defines

IEEE802154\_MAX\_ADDR\_LENGTH

IEEE802154\_NO\_CHANNEL

IEEE802154\_L2\_CTX\_TYPE

IEEE802154\_AR\_FLAG\_SET

## Typedefs

```
typedef void (*energy_scan_done_cb_t)(const struct device *dev, int16_t max_ed)
```

```
typedef void (*ieee802154_event_cb_t)(const struct device *dev, enum ieee802154_event evt, void *event_params)
```

## Enums

enum *ieee802154\_channel*

IEEE 802.15.4 Channel assignments.

Channel numbering for 868 MHz, 915 MHz, and 2450 MHz bands.

- Channel 0 is for 868.3 MHz.
- Channels 1-10 are for 906 to 924 MHz with 2 MHz channel spacing.
- Channels 11-26 are for 2405 to 2530 MHz with 5 MHz channel spacing.

For more information, please refer to 802.15.4-2015 Section 10.1.2.2.

*Values:*

enumerator IEEE802154\_SUB\_GHZ\_CHANNEL\_MIN = 0

enumerator IEEE802154\_SUB\_GHZ\_CHANNEL\_MAX = 10

enumerator IEEE802154\_2\_4\_GHZ\_CHANNEL\_MIN = 11

enumerator IEEE802154\_2\_4\_GHZ\_CHANNEL\_MAX = 26

enum *ieee802154\_hw\_caps*

*Values:*

enumerator IEEE802154\_HW\_FCS = *BIT*(0)

enumerator IEEE802154\_HW\_PROMISC = *BIT*(1)

enumerator IEEE802154\_HW\_FILTER = *BIT*(2)

enumerator IEEE802154\_HW\_CSMA = *BIT*(3)

enumerator IEEE802154\_HW\_2\_4\_GHZ = *BIT*(4)

enumerator IEEE802154\_HW\_TX\_RX\_ACK = *BIT*(5)

enumerator IEEE802154\_HW\_SUB\_GHZ = *BIT*(6)

enumerator IEEE802154\_HW\_ENERGY\_SCAN = *BIT*(7)

enumerator IEEE802154\_HW\_TXTIME = *BIT*(8)

enumerator IEEE802154\_HW\_SLEEP\_TO\_TX = *BIT*(9)

enumerator IEEE802154\_HW\_TX\_SEC = *BIT*(10)

enumerator IEEE802154\_HW\_RXTIME = *BIT*(11)

enum ieee802154\_filter\_type

*Values:*

enumerator IEEE802154\_FILTER\_TYPE\_IEEE\_ADDR

enumerator IEEE802154\_FILTER\_TYPE\_SHORT\_ADDR

enumerator IEEE802154\_FILTER\_TYPE\_PAN\_ID

enumerator IEEE802154\_FILTER\_TYPE\_SRC\_IEEE\_ADDR

enumerator IEEE802154\_FILTER\_TYPE\_SRC\_SHORT\_ADDR

enum ieee802154\_event

*Values:*

enumerator IEEE802154\_EVENT\_TX\_STARTED

enumerator IEEE802154\_EVENT\_RX\_FAILED

enumerator IEEE802154\_EVENT\_SLEEP

enum ieee802154\_rx\_fail\_reason

*Values:*

enumerator IEEE802154\_RX\_FAIL\_NOT\_RECEIVED

enumerator IEEE802154\_RX\_FAIL\_INVALID\_FCS

enumerator IEEE802154\_RX\_FAIL\_ADDR\_FILTERED

enumerator IEEE802154\_RX\_FAIL\_OTHER

enum ieee802154\_tx\_mode

IEEE802.15.4 Transmission mode.

*Values:*

enumerator IEEE802154\_TX\_MODE\_DIRECT

Transmit packet immediately, no CCA.

enumerator IEEE802154\_TX\_MODE\_CCA

Perform CCA before packet transmission.

enumerator IEEE802154\_TX\_MODE\_CSMA\_CA

Perform full CSMA CA procedure before packet transmission.

enumerator IEEE802154\_TX\_MODE\_TXTIME

Transmit packet in the future, at specified time, no CCA.

enumerator IEEE802154\_TX\_MODE\_TXTIME\_CCA

Transmit packet in the future, perform CCA before transmission.

enum ieee802154\_fpb\_mode

IEEE802.15.4 Frame Pending Bit table address matching mode.

*Values:*

enumerator IEEE802154\_FPB\_ADDR\_MATCH\_THREAD

The pending bit shall be set only for addresses found in the list.

enumerator IEEE802154\_FPB\_ADDR\_MATCH\_ZIGBEE

The pending bit shall be cleared for short addresses found in the list.

enum ieee802154\_config\_type

IEEE802.15.4 driver configuration types.

*Values:*

enumerator IEEE802154\_CONFIG\_AUTO\_ACK\_FPB

Indicates how radio driver should set Frame Pending bit in ACK responses for Data Requests. If enabled, radio driver should determine whether to set the bit or not based on the information provided with IEEE802154\_CONFIG\_ACK\_FPB config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1(see IEEE Std 802.15.4-2006, 7.2.2.3.1).

Configure the next CSL receive window center, in units of microseconds, based on the radio time.

enumerator IEEE802154\_CONFIG\_ENH\_ACK\_HEADER\_IE

Indicates whether to inject IE into ENH ACK Frame for specific address or not. Disabling the ENH ACK with no address provided (NULL pointer) should disable it for all enabled addresses.

## Functions

static inline bool ieee802154\_is\_ar\_flag\_set(struct *net\_buf* \*frag)

Check if AR flag is set on the frame inside given *net\_pkt*.

### Parameters

- frag – A valid pointer on a *net\_buf* structure, must not be NULL, and its length should be at least made of 1 byte (ACK frames are the smallest frames on 15.4 and made of 3 bytes, not counting the FCS part).

**Returns** True if AR flag is set, False otherwise

enum *net\_verdict* ieee802154\_radio\_handle\_ack(struct *net\_if* \*iface, struct *net\_pkt* \*pkt)

Radio driver ACK handling function that hw drivers should use.

ACK handling requires fast handling and thus such function helps to hook directly the hw drivers to the radio driver.

### Parameters

- iface – A valid pointer on a network interface that received the packet
- pkt – A valid pointer on a packet to check

**Returns** NET\_OK if it was handled, NET\_CONTINUE otherwise

void ieee802154\_init(struct *net\_if* \*iface)

Initialize L2 stack for a given interface.

### Parameters

- iface – A valid pointer on a network interface

struct ieee802154\_security\_ctx

*#include <ieee802154.h>*

struct ieee802154\_context

*#include <ieee802154.h>*

struct ieee802154\_filter

*#include <ieee802154\_radio.h>*

struct ieee802154\_key

*#include <ieee802154\_radio.h>*

struct ieee802154\_config

*#include <ieee802154\_radio.h>* IEEE802.15.4 driver configuration data.

## Public Members

```

```
uint32_t cs1_rx_time
    IEEE802154_CONFIG_CSL_RX_TIME
```

```
const uint8_t *ext_addr
    The extended address is expected to be passed starting with the leftmost octet and ending
    with the rightmost octet. A device with an extended address 01:23:45:67:89:ab:cd:ef
    should provide a pointer to array containing values in the same exact order.
```

```
struct ieee802154_config.anonymous.anonymous ack_ie
    IEEE802154_CONFIG_ENH_ACK_HEADER_IE
```

```
union ieee802154_config.anonymous anonymous
    Configuration data.
```

```
struct ieee802154_radio_api
    #include <ieee802154_radio.h> IEEE 802.15.4 radio interface API.
```

## Public Members

struct net\_if\_api iface\_api

Mandatory to get in first position. A network device should indeed provide a pointer on such net\_if\_api structure. So we make current structure pointer that can be casted to a net\_if\_api structure pointer.

enum *ieee802154\_hw\_caps* (\*get\_capabilities)(const struct *device* \*dev)

Get the device capabilities

int (\*cca)(const struct *device* \*dev)

Clear Channel Assessment - Check channel's activity

int (\*set\_channel)(const struct *device* \*dev, uint16\_t channel)

Set current channel

int (\*filter)(const struct *device* \*dev, bool set, enum *ieee802154\_filter\_type* type, const struct *ieee802154\_filter* \*filter)

Set/Unset filters (for IEEE802154\_HW\_FILTER )

int (\*set\_txpower)(const struct *device* \*dev, int16\_t dbm)

Set TX power level in dbm

int (\*tx)(const struct *device* \*dev, enum *ieee802154\_tx\_mode* mode, struct *net\_pkt* \*pkt, struct *net\_buf* \*frag)

Transmit a packet fragment

int (\*start)(const struct *device* \*dev)

Start the device

int (\*stop)(const struct *device* \*dev)

Stop the device

int (\*configure)(const struct *device* \*dev, enum *ieee802154\_config\_type* type, const struct *ieee802154\_config* \*config)

Set specific radio driver configuration.

uint16\_t (\*get\_subg\_channel\_count)(const struct *device* \*dev)

Get the available amount of Sub-GHz channels

int (\*ed\_scan)(const struct *device* \*dev, uint16\_t duration, *energy\_scan\_done\_cb\_t* done\_cb)

Run an energy detection scan. Note: channel must be set prior to request this function. duration parameter is in ms.

uint64\_t (\*get\_time)(const struct *device* \*dev)

Get the current radio time in microseconds

uint8\_t (\*get\_sch\_acc)(const struct *device* \*dev)

Get the current accuracy, in units of  $\pm$  ppm, of the clock used for scheduling delayed receive or transmit radio operations. Note: Implementations may optimize this value based on operational conditions (i.e.: temperature).

### Thread protocol

- [Overview](#)
- [Internet connectivity](#)
- [Sample usage](#)

**Overview** Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at [Thread Group website](#).

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the [OpenThread website](#).

**Internet connectivity** A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See [OpenThread Border Router guide](#) for instructions on how to set up a Border Router.

**Sample usage** You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with `overlay-ot.conf` overlay config file. See `sockets-echo-server-sample` and `sockets-echo-client-sample` for details.

## Point-to-Point Protocol (PPP) Support

- [Overview](#)
- [Testing](#)

**Overview** [Point-to-Point Protocol](#) (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.

PPP support must be enabled at compile time by setting option `:kconfig: `CONFIG_NET_PPP`` and `:kconfig: `CONFIG_NET_L2_PPP``. The PPP support in Zephyr 2.0 is still experimental and the implementation supports only these protocols:

- LCP (Link Control Protocol, [RFC1661](#))
- HDLC (High-level data link control, [RFC1662](#))
- IPCP (IP Control Protocol, [RFC1332](#))
- IPV6CP (IPv6 Control Protocol, [RFC5072](#))

See also the `samples/net/sockets/echo_server/overlay-ppp.conf` file for configuration option examples. For using PPP with GSM modem, see [Generic GSM Modem](#) for additional information.

**Testing** See the [net-tools README](#) file for more details on how to test the Zephyr PPP against `pppd` running in Linux.

## 7.20.4 Protocols

### CoAP

- [Overview](#)
- [Sample Usage](#)

- [CoAP Server](#)
- [CoAP Client](#)
- [Testing](#)
  - [libcoap](#)
  - [TTCN3](#)
- [API Reference](#)

**Overview** The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP’s features. For more information about the protocol itself, see [IETF RFC7252 The Constrained Application Protocol](#).

Zephyr provides a CoAP library which supports client and server roles. The library is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn’t create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M “Lightweight Machine 2 Machine” protocol, a simple, low-cost remote management and service enablement mechanism. See [Lightweight M2M \(LWM2M\)](#) for more information.

Supported RFCs:

Supported RFCs:

- [RFC7252: The Constrained Application Protocol \(CoAP\)](#)
- [RFC6690: Constrained RESTful Environments \(CoRE\) Link Format](#)
- [RFC7959: Block-Wise Transfers in the Constrained Application Protocol \(CoAP\)](#)
- [RFC7641: Observing Resources in the Constrained Application Protocol \(CoAP\)](#)

---

**Note:** Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

---

## Sample Usage

**CoAP Server** To create a CoAP server, resources for the server need to be defined. The `.well-known/core` resource should be added before all other resources that should be included in the responses of the `.well-known/core` resource.

```
static struct coap_resource resources[] = {
    { .get = well_known_core_get,
      .path = COAP_WELL_KNOWN_CORE_PATH,
    },
    { .get = sample_get,
      .post = sample_post,
      .del = sample_del,
      .put = sample_put,
      .path = sample_path
    },
    { },
};
```

An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```
coap_packet_parse(&request, data, data_len, options, opt_num);
...
coap_handle_request(&request, resources, options, opt_num,
                   client_addr, client_addr_len);
```

If `:kconfig: CONFIG_COAP_URI_WILDCARD` enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```
static const char * const led_set[] = { "led", "+", "set", NULL };
static const char * const btn_get[] = { "button", "#", NULL };
static const char * const no_wc[] = { "test", "+1", NULL };
```

It accepts `/led/0/set`, `led/1234/set`, `led/any/set`, `/button/door/1`, `/test/+1`, but returns `-ENOENT` for `/led/1`, `/test/21`, `/test/1`.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like `'/some_resource/+/#'`.

**CoAP Client** If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn't know about resources in the CoAP server, it can request resources through the `.well-known/core` CoAP message.

```
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
                1, COAP_TYPE_CON, 8, coap_next_token(),
                COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
                          path, strlen(path));

/* Append Payload marker if you are going to add payload */
coap_packet_append_payload_marker(&request);

/* Append payload */
coap_packet_append_payload(&request, (uint8_t *)payload,
                           sizeof(payload) - 1);

/* send over sockets */
```

**Testing** There are various ways to test Zephyr CoAP library.

**libcoap** libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources

can be found here [libcoap](#). libcoap has a script (examples/etsi\_coaptest.sh) to test coap-server functionality in Zephyr.

See the [net-tools](#) project for more details

The coap-server-sample sample can be built and executed on QEMU as described in [Networking with QEMU](#).

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

**TTCN3** Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```
sudo apt-get install eclipse-titan

cd /usr/share/titan

sudo ln -s /usr/bin/bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib

export TTCN3_DIR=/usr/share/titan

git clone https://github.com/eclipse/titan.misc.git

cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- <https://github.com/eclipse/titan.misc>
- [https://github.com/eclipse/titan.misc/tree/master/CoAP\\_Conf](https://github.com/eclipse/titan.misc/tree/master/CoAP_Conf)

After the build is complete, the coap-server-sample sample can be built and executed on QEMU as described in [Networking with QEMU](#).

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.

```
ttn3_start coaptests coap.cfg
```

Sample output of ttn3 tests looks like this.

```
Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %), 0 error (0.00 %).
Test execution summary: 10 test cases were executed. Overall verdict: pass
```

## API Reference

group coap

COAP library.

## Defines

COAP\_REQUEST\_MASK

COAP\_VERSION\_1

coap\_make\_response\_code(class, det)

COAP\_CODE\_EMPTY

COAP\_TOKEN\_MAX\_LEN

GET\_BLOCK\_NUM(v)

GET\_BLOCK\_SIZE(v)

GET\_MORE(v)

COAP\_DEFAULT\_MAX\_RETRANSMIT

COAP\_DEFAULT\_ACK\_RANDOM\_FACTOR

COAP\_WELL\_KNOWN\_CORE\_PATH

This resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

## Typedefs

typedef int (\*coap\_method\_t)(struct *coap\_resource* \*resource, struct *coap\_packet* \*request, struct *sockaddr* \*addr, *socklen\_t* addr\_len)

Type of the callback being called when a resource's method is invoked by the remote entity.

typedef void (\*coap\_notify\_t)(struct *coap\_resource* \*resource, struct *coap\_observer* \*observer)

Type of the callback being called when a resource's has observers to be informed when an update happens.

typedef int (\*coap\_reply\_t)(const struct *coap\_packet* \*response, struct *coap\_reply* \*reply, const struct *sockaddr* \*from)

Helper function to be called when a response matches the a pending request.

## Enums

enum coap\_option\_num

Set of CoAP packet options we are aware of.

Users may add options other than these to their packets, provided they know how to format them correctly. The only restriction is that all options must be added to a packet in numeric order.

Refer to RFC 7252, section 12.2 for more information.

Values:

enumerator COAP\_OPTION\_IF\_MATCH = 1

enumerator COAP\_OPTION\_URI\_HOST = 3

enumerator COAP\_OPTION\_ETAG = 4

enumerator COAP\_OPTION\_IF\_NONE\_MATCH = 5

enumerator COAP\_OPTION\_OBSERVE = 6

enumerator COAP\_OPTION\_URI\_PORT = 7

enumerator COAP\_OPTION\_LOCATION\_PATH = 8

enumerator COAP\_OPTION\_URI\_PATH = 11

enumerator COAP\_OPTION\_CONTENT\_FORMAT = 12

enumerator COAP\_OPTION\_MAX\_AGE = 14

enumerator COAP\_OPTION\_URI\_QUERY = 15

enumerator COAP\_OPTION\_ACCEPT = 17

enumerator COAP\_OPTION\_LOCATION\_QUERY = 20

enumerator COAP\_OPTION\_BLOCK2 = 23

enumerator COAP\_OPTION\_BLOCK1 = 27

enumerator COAP\_OPTION\_SIZE2 = 28

enumerator COAP\_OPTION\_PROXY\_URI = 35

enumerator COAP\_OPTION\_PROXY\_SCHEME = 39

enumerator COAP\_OPTION\_SIZE1 = 60

enum coap\_method

Available request methods.

To be used when creating a request or a response.

*Values:*

enumerator COAP\_METHOD\_GET = 1

enumerator COAP\_METHOD\_POST = 2

enumerator COAP\_METHOD\_PUT = 3

enumerator COAP\_METHOD\_DELETE = 4

enum coap\_msgtype

CoAP packets may be of one of these types.

*Values:*

enumerator COAP\_TYPE\_CON = 0

Confirmable message.

The packet is a request or response the destination end-point must acknowledge.

enumerator COAP\_TYPE\_NON\_CON = 1

Non-confirmable message.

The packet is a request or response that doesn't require acknowledgements.

enumerator COAP\_TYPE\_ACK = 2

Acknowledge.

Response to a confirmable message.

enumerator COAP\_TYPE\_RESET = 3

Reset.

Rejecting a packet for any reason is done by sending a message of this type.

enum coap\_response\_code

Set of response codes available for a response packet.

To be used when creating a response.

*Values:*

enumerator COAP\_RESPONSE\_CODE\_OK = ((2 << 5) | (0))

enumerator COAP\_RESPONSE\_CODE\_CREATED = ((2 << 5) | (1))

enumerator COAP\_RESPONSE\_CODE\_DELETED = ((2 << 5) | (2))

enumerator COAP\_RESPONSE\_CODE\_VALID = ((2 << 5) | (3))

enumerator COAP\_RESPONSE\_CODE\_CHANGED = ((2 << 5) | (4))

enumerator COAP\_RESPONSE\_CODE\_CONTENT = ((2 << 5) | (5))

enumerator COAP\_RESPONSE\_CODE\_CONTINUE = ((2 << 5) | (31))

```
enumerator COAP_RESPONSE_CODE_BAD_REQUEST = ((4 << 5) | (0))

enumerator COAP_RESPONSE_CODE_UNAUTHORIZED = ((4 << 5) | (1))

enumerator COAP_RESPONSE_CODE_BAD_OPTION = ((4 << 5) | (2))

enumerator COAP_RESPONSE_CODE_FORBIDDEN = ((4 << 5) | (3))

enumerator COAP_RESPONSE_CODE_NOT_FOUND = ((4 << 5) | (4))

enumerator COAP_RESPONSE_CODE_NOT_ALLOWED = ((4 << 5) | (5))

enumerator COAP_RESPONSE_CODE_NOT_ACCEPTABLE = ((4 << 5) | (6))

enumerator COAP_RESPONSE_CODE_INCOMPLETE = ((4 << 5) | (8))

enumerator COAP_RESPONSE_CODE_PRECONDITION_FAILED = ((4 << 5) | (12))

enumerator COAP_RESPONSE_CODE_REQUEST_TOO_LARGE = ((4 << 5) | (13))

enumerator COAP_RESPONSE_CODE_UNSUPPORTED_CONTENT_FORMAT = ((4 << 5) | (15))

enumerator COAP_RESPONSE_CODE_INTERNAL_ERROR = ((5 << 5) | (0))

enumerator COAP_RESPONSE_CODE_NOT_IMPLEMENTED = ((5 << 5) | (1))

enumerator COAP_RESPONSE_CODE_BAD_GATEWAY = ((5 << 5) | (2))

enumerator COAP_RESPONSE_CODE_SERVICE_UNAVAILABLE = ((5 << 5) | (3))

enumerator COAP_RESPONSE_CODE_GATEWAY_TIMEOUT = ((5 << 5) | (4))

enumerator COAP_RESPONSE_CODE_PROXYING_NOT_SUPPORTED = ((5 << 5) | (5))
```

```
enum coap_content_format
```

Set of Content-Format option values for CoAP.

To be used when encoding or decoding a Content-Format option.

*Values:*

```
enumerator COAP_CONTENT_FORMAT_TEXT_PLAIN = 0
```

```
enumerator COAP_CONTENT_FORMAT_APP_LINK_FORMAT = 40
```

```
enumerator COAP_CONTENT_FORMAT_APP_XML = 41
```

enumerator COAP\_CONTENT\_FORMAT\_APP\_OCTET\_STREAM = 42

enumerator COAP\_CONTENT\_FORMAT\_APP\_EXI = 47

enumerator COAP\_CONTENT\_FORMAT\_APP\_JSON = 50

enumerator COAP\_CONTENT\_FORMAT\_APP\_CBOR = 60

enum coap\_block\_size

Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:

Each entry maps directly to the value that is used in the wire.

<https://tools.ietf.org/html/rfc7959>

*Values:*

enumerator COAP\_BLOCK\_16

enumerator COAP\_BLOCK\_32

enumerator COAP\_BLOCK\_64

enumerator COAP\_BLOCK\_128

enumerator COAP\_BLOCK\_256

enumerator COAP\_BLOCK\_512

enumerator COAP\_BLOCK\_1024

## Functions

uint8\_t coap\_header\_get\_version(const struct *coap\_packet* \*cpkt)

Returns the version present in a CoAP packet.

### Parameters

- cpkt – CoAP packet representation

**Returns** the CoAP version in packet

uint8\_t coap\_header\_get\_type(const struct *coap\_packet* \*cpkt)

Returns the type of the CoAP packet.

### Parameters

- cpkt – CoAP packet representation

**Returns** the type of the packet

uint8\_t coap\_header\_get\_token(const struct [coap\\_packet](#) \*cpkt, uint8\_t \*token)

Returns the token (if any) in the CoAP packet.

**Parameters**

- cpkt – CoAP packet representation
- token – Where to store the token, must point to a buffer containing at least COAP\_TOKEN\_MAX\_LEN bytes

**Returns** Token length in the CoAP packet (0 - COAP\_TOKEN\_MAX\_LEN).

uint8\_t coap\_header\_get\_code(const struct [coap\\_packet](#) \*cpkt)

Returns the code of the CoAP packet.

**Parameters**

- cpkt – CoAP packet representation

**Returns** the code present in the packet

uint16\_t coap\_header\_get\_id(const struct [coap\\_packet](#) \*cpkt)

Returns the message id associated with the CoAP packet.

**Parameters**

- cpkt – CoAP packet representation

**Returns** the message id present in the packet

const uint8\_t \*coap\_packet\_get\_payload(const struct [coap\\_packet](#) \*cpkt, uint16\_t \*len)

Returns the data pointer and length of the CoAP packet.

**Parameters**

- cpkt – CoAP packet representation
- len – Total length of CoAP payload

**Returns** data pointer and length if payload exists NULL pointer and length set to 0 in case there is no payload

int coap\_packet\_parse(struct [coap\\_packet](#) \*cpkt, uint8\_t \*data, uint16\_t len, struct [coap\\_option](#) \*options, uint8\_t opt\_num)

Parses the CoAP packet in data, validating it and initializing *cpkt*. *data* must remain valid while *cpkt* is used.

**Parameters**

- cpkt – Packet to be initialized from received *data*.
- data – Data containing a CoAP packet, its *data* pointer is positioned on the start of the CoAP packet.
- len – Length of the data
- options – Parse options and cache its details.
- opt\_num – Number of options

**Returns** 0 in case of success or negative in case of error.

int coap\_packet\_init(struct [coap\\_packet](#) \*cpkt, uint8\_t \*data, uint16\_t max\_len, uint8\_t ver, uint8\_t type, uint8\_t token\_len, const uint8\_t \*token, uint8\_t code, uint16\_t id)

Creates a new CoAP Packet from input data.

**Parameters**

- cpkt – New packet to be initialized using the storage from *data*.

- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `ver` – CoAP header version
- `type` – CoAP header type
- `token_len` – CoAP header token length
- `token` – CoAP header token
- `code` – CoAP header code
- `id` – CoAP header message id

**Returns** 0 in case of success or negative in case of error.

```
int coap_ack_init(struct coap_packet *cpkt, const struct coap_packet *req, uint8_t *data,  
                uint16_t max_len, uint8_t code)
```

Create a new CoAP Acknowledgment message for given request.

This function works like *coap\_packet\_init*, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

#### Parameters

- `cpkt` – New packet to be initialized using the storage from *data*.
- `req` – CoAP request packet that is being acknowledged
- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `code` – CoAP header code

**Returns** 0 in case of success or negative in case of error.

```
uint8_t *coap_next_token(void)
```

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

**Returns** a 8-byte pseudo-random token.

```
uint16_t coap_next_id(void)
```

Helper to generate message ids.

**Returns** a new message id

```
int coap_find_options(const struct coap_packet *cpkt, uint16_t code, struct coap_option  
                    *options, uint16_t veclen)
```

Return the values associated with the option of value *code*.

#### Parameters

- `cpkt` – CoAP packet representation
- `code` – Option number to look for
- `options` – Array of *coap\_option* where to store the value of the options found
- `veclen` – Number of elements in the options array

**Returns** The number of options found in packet matching code, negative on error.

```
int coap_packet_append_option(struct coap_packet *cpkt, uint16_t code, const uint8_t *value,  
                             uint16_t len)
```

Appends an option to the packet.

Note: options must be added in numeric order of their codes. Otherwise error will be returned.  
TODO: Add support for placing options according to its delta value.

**Parameters**

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see [coap\\_option\\_num](#)
- `value` – Pointer to the value of the option, will be copied to the packet
- `len` – Size of the data to be added

**Returns** 0 in case of success or negative in case of error.

`unsigned int coap_option_value_to_int(const struct coap\_option *option)`

Converts an option to its integer representation.

Assumes that the number is encoded in the network byte order in the option.

**Parameters**

- `option` – Pointer to the option value, retrieved by [coap\\_find\\_options\(\)](#)

**Returns** The integer representation of the option

`int coap_append_option_int(struct coap\_packet *cpkt, uint16_t code, unsigned int val)`

Appends an integer value option to the packet.

The option must be added in numeric order of their codes, and the least amount of bytes will be used to encode the value.

**Parameters**

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see [coap\\_option\\_num](#)
- `val` – Integer value to be added

**Returns** 0 in case of success or negative in case of error.

`int coap_packet_append_payload_marker(struct coap\_packet *cpkt)`

Append payload marker to CoAP packet.

**Parameters**

- `cpkt` – Packet to append the payload marker (0xFF)

**Returns** 0 in case of success or negative in case of error.

`int coap_packet_append_payload(struct coap\_packet *cpkt, const uint8_t *payload, uint16_t payload_len)`

Append payload to CoAP packet.

**Parameters**

- `cpkt` – Packet to append the payload
- `payload` – CoAP packet payload
- `payload_len` – CoAP packet payload len

**Returns** 0 in case of success or negative in case of error.

`int coap_handle_request(struct coap\_packet *cpkt, struct coap\_resource *resources, struct coap\_option *options, uint8_t opt_num, struct sockaddr *addr, socklen\_t addr_len)`

When a request is received, call the appropriate methods of the matching resources.

**Parameters**

- `cpkt` – Packet received
- `resources` – Array of known resources

- `options` – Parsed options from `coap_packet_parse()`
- `opt_num` – Number of options
- `addr` – Peer address
- `addr_len` – Peer address length

**Returns** 0 in case of success or negative in case of error.

static inline uint16\_t coap\_block\_size\_to\_bytes(enum `coap_block_size` block\_size)

Helper for converting the enumeration to the size expressed in bytes.

**Parameters**

- `block_size` – The block size to be converted

**Returns** The size in bytes that the `block_size` represents

int coap\_block\_transfer\_init(struct `coap_block_context` \*ctx, enum `coap_block_size` block\_size, size\_t total\_size)

Initializes the context of a block-wise transfer.

**Parameters**

- `ctx` – The context to be initialized
- `block_size` – The size of the block
- `total_size` – The total size of the transfer, if known

**Returns** 0 in case of success or negative in case of error.

int coap\_append\_block1\_option(struct `coap_packet` \*cpkt, struct `coap_block_context` \*ctx)

Append BLOCK1 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Block1 option

**Returns** 0 in case of success or negative in case of error.

int coap\_append\_block2\_option(struct `coap_packet` \*cpkt, struct `coap_block_context` \*ctx)

Append BLOCK2 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Block2 option

**Returns** 0 in case of success or negative in case of error.

int coap\_append\_size1\_option(struct `coap_packet` \*cpkt, struct `coap_block_context` \*ctx)

Append SIZE1 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Size1 option

**Returns** 0 in case of success or negative in case of error.

```
int coap_append_size2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Append SIZE2 option to the packet.

**Parameters**

- *cpkt* – Packet to be updated
- *ctx* – Block context from which to retrieve the information for the Size2 option

**Returns** 0 in case of success or negative in case of error.

```
int coap_get_option_int(const struct coap_packet *cpkt, uint16_t code)
```

Get the integer representation of a CoAP option.

**Parameters**

- *cpkt* – Packet to be inspected
- *code* – CoAP option code

**Returns** Integer value  $\geq 0$  in case of success or negative in case of error.

```
int coap_update_from_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Retrieves BLOCK{1,2} and SIZE{1,2} from *cpkt* and updates *ctx* accordingly.

**Parameters**

- *cpkt* – Packet in which to look for block-wise transfers options
- *ctx* – Block context to be updated

**Returns** 0 in case of success or negative in case of error.

```
size_t coap_next_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Updates *ctx* so after this is called the current entry indicates the correct offset in the body of data being transferred.

**Parameters**

- *cpkt* – Packet in which to look for block-wise transfers options
- *ctx* – Block context to be updated

**Returns** The offset in the block-wise transfer, 0 if the transfer has finished.

```
void coap_observer_init(struct coap_observer *observer, const struct coap_packet *request,  
                        const struct sockaddr *addr)
```

Indicates that the remote device referenced by *addr*, with *request*, wants to observe a resource.

**Parameters**

- *observer* – Observer to be initialized
- *request* – Request on which the observer will be based
- *addr* – Address of the remote device

```
bool coap_register_observer(struct coap_resource *resource, struct coap_observer *observer)
```

After the observer is initialized, associate the observer with an resource.

**Parameters**

- *resource* – Resource to add an observer
- *observer* – Observer to be added

**Returns** true if this is the first observer added to this resource.

void coap\_remove\_observer(struct [coap\\_resource](#) \*resource, struct [coap\\_observer](#) \*observer)

Remove this observer from the list of registered observers of that resource.

**Parameters**

- resource – Resource in which to remove the observer
- observer – Observer to be removed

struct [coap\\_observer](#) \*coap\_find\_observer\_by\_addr(struct [coap\\_observer](#) \*observers, size\_t len,  
const struct [sockaddr](#) \*addr)

Returns the observer that matches address *addr*.

**Parameters**

- observers – Pointer to the array of observers
- len – Size of the array of observers
- addr – Address of the endpoint observing a resource

**Returns** A pointer to a observer if a match is found, NULL otherwise.

struct [coap\\_observer](#) \*coap\_observer\_next\_unused(struct [coap\\_observer](#) \*observers, size\_t len)

Returns the next available observer representation.

**Parameters**

- observers – Pointer to the array of observers
- len – Size of the array of observers

**Returns** A pointer to a observer if there's an available observer, NULL otherwise.

void coap\_reply\_init(struct [coap\\_reply](#) \*reply, const struct [coap\\_packet](#) \*request)

Indicates that a reply is expected for *request*.

**Parameters**

- reply – Reply structure to be initialized
- request – Request from which *reply* will be based

int coap\_pending\_init(struct [coap\\_pending](#) \*pending, const struct [coap\\_packet](#) \*request, const  
struct [sockaddr](#) \*addr, uint8\_t retries)

Initialize a pending request with a request.

The request's fields are copied into the pending struct, so *request* doesn't have to live for as long as the pending struct lives, but "data" that needs to live for at least that long.

**Parameters**

- pending – Structure representing the waiting for a confirmation message, initialized with data from *request*
- request – Message waiting for confirmation
- addr – Address to send the retransmission
- retries – Maximum number of retransmissions of the message.

**Returns** 0 in case of success or negative in case of error.

struct [coap\\_pending](#) \*coap\_pending\_next\_unused(struct [coap\\_pending](#) \*pendings, size\_t len)

Returns the next available pending struct, that can be used to track the retransmission status of a request.

**Parameters**

- pendings – Pointer to the array of [coap\\_pending](#) structures
- len – Size of the array of [coap\\_pending](#) structures

**Returns** pointer to a free `coap_pending` structure, NULL in case none could be found.

```
struct coap_reply *coap_reply_next_unused(struct coap_reply *replies, size_t len)
```

Returns the next available reply struct, so it can be used to track replies and notifications received.

**Parameters**

- `replies` – Pointer to the array of `coap_reply` structures
- `len` – Size of the array of `coap_reply` structures

**Returns** pointer to a free `coap_reply` structure, NULL in case none could be found.

```
struct coap_pending *coap_pending_received(const struct coap_packet *response, struct coap_pending *pendings, size_t len)
```

After a response is received, returns if there is any matching pending request exists. User has to clear all pending retransmissions related to that response by calling `coap_pending_clear()`.

**Parameters**

- `response` – The received response
- `pendings` – Pointer to the array of `coap_reply` structures
- `len` – Size of the array of `coap_reply` structures

**Returns** pointer to the associated `coap_pending` structure, NULL in case none could be found.

```
struct coap_reply *coap_response_received(const struct coap_packet *response, const struct sockaddr *from, struct coap_reply *replies, size_t len)
```

After a response is received, call `coap_reply_t` handler registered in `coap_reply` structure.

**Parameters**

- `response` – A response received
- `from` – Address from which the response was received
- `replies` – Pointer to the array of `coap_reply` structures
- `len` – Size of the array of `coap_reply` structures

**Returns** Pointer to the reply matching the packet received, NULL if none could be found.

```
struct coap_pending *coap_pending_next_to_expire(struct coap_pending *pendings, size_t len)
```

Returns the next pending about to expire, `pending->timeout` informs how many ms to next expiration.

**Parameters**

- `pendings` – Pointer to the array of `coap_pending` structures
- `len` – Size of the array of `coap_pending` structures

**Returns** The next `coap_pending` to expire, NULL if none is about to expire.

```
bool coap_pending_cycle(struct coap_pending *pending)
```

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

**Parameters**

- `pending` – Pending representation to have its timeout updated

**Returns** false if this is the last retransmission.

void coap\_pending\_clear(struct *coap\_pending* \*pending)

Cancels the pending retransmission, so it again becomes available.

**Parameters**

- pending – Pending representation to be canceled

void coap\_pendings\_clear(struct *coap\_pending* \*pendings, size\_t len)

Cancels all pending retransmissions, so they become available again.

**Parameters**

- pendings – Pointer to the array of *coap\_pending* structures
- len – Size of the array of *coap\_pending* structures

void coap\_reply\_clear(struct *coap\_reply* \*reply)

Cancels awaiting for this reply, so it becomes available again. User responsibility to free the memory associated with data.

**Parameters**

- reply – The reply to be canceled

void coap\_replies\_clear(struct *coap\_reply* \*replies, size\_t len)

Cancels all replies, so they become available again.

**Parameters**

- replies – Pointer to the array of *coap\_reply* structures
- len – Size of the array of *coap\_reply* structures

int coap\_resource\_notify(struct *coap\_resource* \*resource)

Indicates that this resource was updated and that the *notify* callback should be called for every registered observer.

**Parameters**

- resource – Resource that was updated

**Returns** 0 in case of success or negative in case of error.

bool coap\_request\_is\_observe(const struct *coap\_packet* \*request)

Returns if this request is enabling observing a resource.

**Parameters**

- request – Request to be checked

**Returns** True if the request is enabling observing a resource, False otherwise

int coap\_well\_known\_core\_get(struct *coap\_resource* \*resource, struct *coap\_packet* \*request,  
struct *coap\_packet* \*response, uint8\_t \*data, uint16\_t len)

struct coap\_resource

*#include <coap.h>* Description of CoAP resource.

CoAP servers often want to register resources, so that clients can act on them, by fetching their state or requesting updates to them.

**Public Members**

*coap\_method\_t* get

Which function to be called for each CoAP method

```
struct coap_observer
```

*#include <coap.h>* Represents a remote device that is observing a local resource.

```
struct coap_packet
```

*#include <coap.h>* Representation of a CoAP Packet.

```
struct coap_option
```

*#include <coap.h>*

```
struct coap_pending
```

*#include <coap.h>* Represents a request awaiting for an acknowledgment (ACK).

```
struct coap_reply
```

*#include <coap.h>* Represents the handler for the reply of a request, it is also used when observing resources.

```
struct coap_block_context
```

*#include <coap.h>* Represents the current state of a block-wise transaction.

```
struct coap_core_metadata
```

*#include <coap\_link\_format.h>* In case you want to add attributes to the resources included in the ‘well-known/core’ “virtual” resource, the ‘user\_data’ field should point to a valid [coap\\_core\\_metadata](#) structure.

## Lightweight M2M (LWM2M)

- [Overview](#)
- [Example Lwm2m object and resources: Device](#)
- [Sample usage](#)
- [Using Lwm2m library with DTLS](#)
- [API Reference](#)

**Overview** Lightweight Machine to Machine (Lwm2m) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, [Lwm2m](#) is a [standard](#) defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between Lwm2m and CoAP is that an Lwm2m client initiates the connection to an Lwm2m server. The server can then use the REST API to manage various interfaces with the client.

Lwm2m uses a simple resource model with the core set of objects and resources defined in the specification.

### Example Lwm2m object and resources: Device *Object definition*

Object ID	Name	Instance	Mandatory
3	Device	Single	Mandatory

### Resource definitions

\* R=Read, W=Write, E=Execute

ID	Name	OP*	Instance	Mandatory	Type
0	Manufacturer	R	Single	Optional	String
1	Model	R	Single	Optional	String
2	Serial number	R	Single	Optional	String
3	Firmware version	R	Single	Optional	String
4	Reboot	E	Single	Mandatory	
5	Factory Reset	E	Single	Optional	
6	Available Power Sources	R	Multiple	Optional	Integer 0-7
7	Power Source Voltage (mV)	R	Multiple	Optional	Integer
8	Power Source Current (mA)	R	Multiple	Optional	Integer
9	Battery Level %	R	Single	Optional	Integer
10	Memory Free (Kb)	R	Single	Optional	Integer
11	Error Code	R	Multiple	Optional	Integer 0-8
12	Reset Error	E	Single	Optional	
13	Current Time	RW	Single	Optional	Time
14	UTC Offset	RW	Single	Optional	String
15	Timezone	RW	Single	Optional	String
16	Supported Binding	R	Single	Mandatory	String
17	Device Type	R	Single	Optional	String
18	Hardware Version	R	Single	Optional	String
19	Software Version	R	Single	Optional	String
20	Battery Status	R	Single	Optional	Integer 0-6
21	Memory Total (Kb)	R	Single	Optional	Integer
22	ExtDevInfo	R	Multiple	Optional	ObjLnk

The server could query the `Manufacturer` resource for `Device` object instance 0 (the default and only instance) by sending a `READ 3/0/0` operation to the client.

The full list of registered objects and resource IDs can be found in the [LwM2M registry](#).

Zephyr's LwM2M library lives in the [subsys/net/lib/lwm2m](#), with a client sample in [samples/net/lwm2m\\_client](#). For more information about the provided sample see: [lwm2m-client-sample](#). The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

The library currently implements up to [LwM2M specification 1.0.2](#).

For more information about LwM2M visit [OMA Specworks LwM2M](#).

**Sample usage** To use the LwM2M library, start by creating an LwM2M client context `lwm2m_ctx` structure:

```
/* LwM2M client context */
static struct lwm2m_ctx client;
```

Create callback functions for LwM2M resource exuctions:

```
static int device_reboot_cb(uint16_t obj_inst_id, uint8_t *args,
                           uint16_t args_len)
{
    LOG_INF("Device rebooting.");
    LOG_PANIC();
    sys_reboot(0);
    return 0; /* wont reach this */
}
```

The Lwm2M RD client can send events back to the sample. To receive those events, setup a callback function:

```
static void rd_client_event(struct lwm2m_ctx *client,
                          enum lwm2m_rd_client_event client_event)
{
    switch (client_event) {
        case LWM2M_RD_CLIENT_EVENT_NONE:
            /* do nothing */
            break;

        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
            LOG_DBG("Bootstrap registration failure!");
            break;

        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
            LOG_DBG("Bootstrap registration complete");
            break;

        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
            LOG_DBG("Bootstrap transfer complete");
            break;

        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
            LOG_DBG("Registration failure!");
            break;

        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
            LOG_DBG("Registration complete");
            break;

        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_FAILURE:
            LOG_DBG("Registration update failure!");
            break;

        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
            LOG_DBG("Registration update complete");
            break;

        case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
            LOG_DBG("Deregister failure!");
            break;

        case LWM2M_RD_CLIENT_EVENT_DISCONNECT:
            LOG_DBG("Disconnected");
            break;
    }
}
```

(continues on next page)

(continued from previous page)

```
}  
}
```

Next we assign Security resource values to let the client know where and how to connect as well as set the Manufacturer and Reboot resources in the Device object with some data and the callback we defined above:

```
/*  
 * Server URL of default Security object = 0/0/0  
 * Use leshan.eclipse.org server IP (5.39.83.206) for connection  
 */  
lwm2m_engine_set_string("0/0/0", "coap://5.39.83.206");  
  
/*  
 * Security Mode of default Security object = 0/0/2  
 * 3 = NoSec mode (no security beware!)  
 */  
lwm2m_engine_set_u8("0/0/2", 3);  
  
#define CLIENT_MANUFACTURER "Zephyr Manufacturer"  
  
/*  
 * Manufacturer resource of Device object = 3/0/0  
 * We use lwm2m_engine_set_res_data() function to set a pointer to the  
 * CLIENT_MANUFACTURER string.  
 * Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from  
 * trying to assign a new value to the buffer.  
 */  
lwm2m_engine_set_res_data("3/0/0", CLIENT_MANUFACTURER,  
                          sizeof(CLIENT_MANUFACTURER),  
                          LWM2M_RES_DATA_FLAG_RO);  
  
/* Reboot resource of Device object = 3/0/4 */  
lwm2m_engine_register_exec_callback("3/0/4", device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of `lwm2m_rd_client_start()` is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```
(void)memset(&client, 0x0, sizeof(client));  
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

**Using LwM2M library with DTLS** The Zephyr LwM2M library can be used with DTLS transport for secure communication by selecting `:kconfig:CONFIG_LWM2M_DTLS_SUPPORT`. In the client initialization we need to create a PSK and identity. These need to match the security information loaded onto the LwM2M server. Normally, the endpoint name is used to lookup the related security information:

```
/* "000102030405060708090a0b0c0d0e0f" */  
static unsigned char client_psk[] = {  
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,  
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f  
};  
  
static const char client_identity[] = "Client_identity";
```

Next we alter the Security object resources to include DTLS security information. The server URL

should begin with `coaps://` to indicate security is required. Assign a 0 value (Pre-shared Key mode) to the Security Mode resource. Lastly, set the client identity and PSK resources.

```
/* Use coaps:// for server URL protocol */
lwm2m_engine_set_string("0/0/0", "coaps://5.39.83.206");
/* 0 = Pre-Shared Key mode */
lwm2m_engine_set_u8("0/0/2", 0);
/* Set the client identity */
lwm2m_engine_set_string("0/0/3", (char *)client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_engine_set_opaque("0/0/5", (void *)client_psk, sizeof(client_psk));
```

Before calling `lwm2m_rd_client_start()` assign the `tls_tag` # where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

```
(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <--- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);
```

For a more detailed LwM2M client sample see: `lwm2m-client-sample`.

## API Reference

`group lwm2m_api`

LwM2M high-level API.

LwM2M high-level interface is defined in this header.

---

**Note:** The implementation assumes UDP module is enabled.

---

---

**Note:** LwM2M 1.0.x is currently the only supported version.

---

## Defines

`LWM2M_OBJECT_SECURITY_ID`

LwM2M Objects managed by OMA for LwM2M tech specification. Objects in this range have IDs from 0 to 1023. For more information refer to Technical Specification OMA-TS-LightweightM2M-V1\_0\_2-20180209-A.

`LWM2M_OBJECT_SERVER_ID`

`LWM2M_OBJECT_ACCESS_CONTROL_ID`

`LWM2M_OBJECT_DEVICE_ID`

`LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID`

`LWM2M_OBJECT_FIRMWARE_ID`

`LWM2M_OBJECT_LOCATION_ID`

LWM2M\_OBJECT\_CONNECTIVITY\_STATISTICS\_ID

IPSO\_OBJECT\_GENERIC\_SENSOR\_ID

Lwm2m Objects produced by 3rd party Standards Development Organizations. Objects in this range have IDs from 2048 to 10240 Refer to the OMA LightweightM2M (Lwm2m) Object and Resource Registry: <http://www.openmobilealliance.org/wp/OMNA/Lwm2m/Lwm2mRegistry.html>.

IPSO\_OBJECT\_TEMP\_SENSOR\_ID

IPSO\_OBJECT\_HUMIDITY\_SENSOR\_ID

IPSO\_OBJECT\_LIGHT\_CONTROL\_ID

IPSO\_OBJECT\_ACCELEROMETER\_ID

IPSO\_OBJECT\_PRESSURE\_ID

IPSO\_OBJECT\_BUZZER\_ID

IPSO\_OBJECT\_TIMER\_ID

IPSO\_OBJECT\_ONOFF\_SWITCH\_ID

IPSO\_OBJECT\_PUSH\_BUTTON\_ID

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_DC\_POWER

Power source types used for the “Available Power Sources” resource of the Lwm2m Device object.

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_BAT\_INT

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_BAT\_EXT

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_UNUSED

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_PWR\_OVER\_ETH

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_USB

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_AC\_POWER

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_SOLAR

LWM2M\_DEVICE\_PWR\_SRC\_TYPE\_MAX

LWM2M\_DEVICE\_ERROR\_NONE

Error codes used for the “Error Code” resource of the LwM2M Device object. An LwM2M client can register one of the following error codes via the [`lwm2m\_device\_add\_err\(\)`](#) function.

LWM2M\_DEVICE\_ERROR\_LOW\_POWER

LWM2M\_DEVICE\_ERROR\_EXT\_POWER\_SUPPLY\_OFF

LWM2M\_DEVICE\_ERROR\_GPS\_FAILURE

LWM2M\_DEVICE\_ERROR\_LOW\_SIGNAL\_STRENGTH

LWM2M\_DEVICE\_ERROR\_OUT\_OF\_MEMORY

LWM2M\_DEVICE\_ERROR\_SMS\_FAILURE

LWM2M\_DEVICE\_ERROR\_NETWORK\_FAILURE

LWM2M\_DEVICE\_ERROR\_PERIPHERAL\_FAILURE

LWM2M\_DEVICE\_BATTERY\_STATUS\_NORMAL

Battery status codes used for the “Battery Status” resource (3/0/20) of the LwM2M Device object. As the battery status changes, an LwM2M client can set one of the following codes via: `lwm2m_engine_set_u8(“3/0/20”, [battery status])`

LWM2M\_DEVICE\_BATTERY\_STATUS\_CHARGING

LWM2M\_DEVICE\_BATTERY\_STATUS\_CHARGE\_COMP

LWM2M\_DEVICE\_BATTERY\_STATUS\_DAMAGED

LWM2M\_DEVICE\_BATTERY\_STATUS\_LOW

LWM2M\_DEVICE\_BATTERY\_STATUS\_NOT\_INST

LWM2M\_DEVICE\_BATTERY\_STATUS\_UNKNOWN

STATE\_IDLE

LWM2M Firmware Update object states.

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

STATE\_DOWNLOADING

STATE\_DOWNLOADED

STATE\_UPDATING

RESULT\_DEFAULT

LWM2M Firmware Update object result codes.

After processing a firmware update, the client sets the result via one of the following codes via `lwm2m_engine_set_u8("5/0/5", [result code])`

RESULT\_SUCCESS

RESULT\_NO\_STORAGE

RESULT\_OUT\_OF\_MEM

RESULT\_CONNECTION\_LOST

RESULT\_INTEGRITY\_FAILED

RESULT\_UNSUP\_FW

RESULT\_INVALID\_URI

RESULT\_UPDATE\_FAILED

RESULT\_UNSUP\_PROTO

LWM2M\_FLOAT32\_DEC\_MAX

Data structure used to represent the LwM2M float type: val1 is the whole number portion of the decimal val2 is the decimal portion \*1000000 for 32bit, \*1000000000 for 64bit Example: 123.456 == val1: 123, val2:456000 Example: 123.000456 = val1: 123, val2:456.

Maximum precision value for 32-bit LwM2M float val2

LWM2M\_OBJLNK\_MAX\_ID

Maximum value for ObjLnk resource fields.

LWM2M\_RES\_DATA\_READ\_ONLY

Resource read-only value bit.

LWM2M\_RES\_DATA\_FLAG\_RO

Resource read-only flag.

LWM2M\_HAS\_RES\_FLAG(res, f)

Read resource flags helper macro.

LWM2M\_RD\_CLIENT\_FLAG\_BOOTSTRAP

Run bootstrap procedure in current session.

## Typedefs

```
typedef void (*lwm2m_socket_fault_cb_t)(int error)
```

```
typedef void (*lwm2m_notify_timeout_cb_t)(void)
```

```
typedef void (*lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)
```

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource's data buffer.

The client or LwM2M objects can register a function of this type via: [lwm2m\\_engine\\_register\\_read\\_callback\(\)](#) [lwm2m\\_engine\\_register\\_pre\\_write\\_callback\(\)](#)

**Param obj\_inst\_id [in]** Object instance ID generating the callback.

**Param res\_id [in]** Resource ID generating the callback.

**Param res\_inst\_id [in]** Resource instance ID generating the callback (typically 0 for non-multi instance resources).

**Param data\_len [out]** Length of the data buffer.

**Return** Callback returns a pointer to the data buffer or NULL for failure.

```
typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size)
```

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

A function of this type can be registered via: [lwm2m\\_engine\\_register\\_validate\\_callback\(\)](#) [lwm2m\\_engine\\_register\\_post\\_write\\_callback\(\)](#)

**Param obj\_inst\_id [in]** Object instance ID generating the callback.

**Param res\_id [in]** Resource ID generating the callback.

**Param res\_inst\_id [in]** Resource instance ID generating the callback (typically 0 for non-multi instance resources).

**Param data [in]** Pointer to data.

**Param data\_len [in]** Length of the data.

**Param last\_block [in]** Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

**Param total\_size [in]** Expected total size of data for a block transfer. For non-block transfers this is 0.

**Return** Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

```
typedef int (*lwm2m_engine_user_cb_t)(uint16_t obj_inst_id)
```

Asynchronous event notification callback.

Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.

Register a function of this type via: [lwm2m\\_engine\\_register\\_create\\_callback\(\)](#) [lwm2m\\_engine\\_register\\_delete\\_callback\(\)](#)

**Param obj\_inst\_id [in]** Object instance ID generating the callback.

**Return** Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

```
typedef int (*lwm2m_engine_execute_cb_t)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)
```

Asynchronous execute notification callback.

Resource executes trigger a callback of this type.

Register a function of this type via: [lwm2m\\_engine\\_register\\_exec\\_callback\(\)](#)

**Param obj\_inst\_id [in]** Object instance ID generating the callback.

**Param args [in]** Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

**Param args\_len [in]** Length of argument payload in bytes.

**Return** Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

```
typedef struct float32\_value float32_value_t
```

32-bit variant of the LwM2M float structure

```
typedef void (*lwm2m_ctx_event_cb_t)(struct lwm2m\_ctx *ctx, enum lwm2m\_rd\_client\_event event)
```

Asynchronous RD client event callback.

**Param ctx [in]** LwM2M context generating the event

**Param event [in]** LwM2M RD client event code

## Enums

```
enum lwm2m_rd_client_event
```

LwM2M RD client events.

LwM2M client events are passed back to the event\_cb function in [lwm2m\\_rd\\_client\\_start\(\)](#)

Values:

enumerator LWM2M\_RD\_CLIENT\_EVENT\_NONE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_BOOTSTRAP\_REG\_FAILURE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_BOOTSTRAP\_REG\_COMPLETE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_BOOTSTRAP\_TRANSFER\_COMPLETE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_REGISTRATION\_FAILURE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_REGISTRATION\_COMPLETE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_REG\_UPDATE\_FAILURE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_REG\_UPDATE\_COMPLETE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_DEREGISTER\_FAILURE

enumerator LWM2M\_RD\_CLIENT\_EVENT\_DISCONNECT

enumerator LWM2M\_RD\_CLIENT\_EVENT\_QUEUE\_MODE\_RX\_OFF

enumerator LWM2M\_RD\_CLIENT\_EVENT\_NETWORK\_ERROR

## Functions

`int lwm2m_device_add_err(uint8_t error_code)`

Register a new error code with Lwm2m Device object.

### Parameters

- `error_code` – **[in]** New error code.

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_update_observer_min_period(char *pathstr, uint32_t period_s)`

Change an observer's pmin value.

Lwm2m clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed: `lwm2m_engine_update_observer_min_period("3303/0/5700",5);`

### Parameters

- `pathstr` – **[in]** Lwm2m path string "obj/obj-inst/res"
- `period_s` – **[in]** Value of pmin to be given (in seconds).

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_update_observer_max_period(char *pathstr, uint32_t period_s)`

Change an observer's pmax value.

Lwm2m clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed: `lwm2m_engine_update_observer_max_period("3303/0/5700",5);`

### Parameters

- `pathstr` – **[in]** Lwm2m path string "obj/obj-inst/res"
- `period_s` – **[in]** Value of pmax to be given (in seconds).

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_create_obj_inst(char *pathstr)`

Create an Lwm2m object instance.

Lwm2m clients use this function to create non-default Lwm2m objects: Example to create first temperature sensor object: `lwm2m_engine_create_obj_inst("3303/0");`

### Parameters

- `pathstr` – **[in]** Lwm2m path string "obj/obj-inst"

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_delete_obj_inst(char *pathstr)
```

Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst”

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_opaque(char *pathstr, char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- data\_ptr – **[in]** Data buffer
- data\_len – **[in]** Length of buffer

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_string(char *pathstr, char *data_ptr)
```

Set resource (instance) value (string)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- data\_ptr – **[in]** NULL terminated char buffer

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_u8(char *pathstr, uint8_t value)
```

Set resource (instance) value (u8)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[in]** u8 value

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_u16(char *pathstr, uint16_t value)
```

Set resource (instance) value (u16)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[in]** u16 value

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_u32(char *pathstr, uint32_t value)
```

Set resource (instance) value (u32)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[in]** u32 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_u64(char *pathstr, uint64_t value)`

Set resource (instance) value (u64)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** u64 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_s8(char *pathstr, int8_t value)`

Set resource (instance) value (s8)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** s8 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_s16(char *pathstr, int16_t value)`

Set resource (instance) value (s16)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** s16 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_s32(char *pathstr, int32_t value)`

Set resource (instance) value (s32)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** s32 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_s64(char *pathstr, int64_t value)`

Set resource (instance) value (s64)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** s64 value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_bool(char *pathstr, bool value)`

Set resource (instance) value (bool)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[in]** bool value

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_set_float32(char *pathstr, float32_value_t *value)`

Set resource (instance) value (32-bit float structure)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”

- value – **[in]** 32-bit float value

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_set\_objlnk(char \*pathstr, struct *lwm2m\_objlnk* \*value)

Set resource (instance) value (ObjLnk)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[in]** pointer to the *lwm2m\_objlnk* structure

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_get\_opaque(char \*pathstr, void \*buf, uint16\_t buflen)

Get resource (instance) value (opaque buffer)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- buf – **[out]** Data buffer to copy data into
- buflen – **[in]** Length of buffer

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_get\_string(char \*pathstr, void \*str, uint16\_t strlen)

Get resource (instance) value (string)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- str – **[out]** String buffer to copy data into
- strlen – **[in]** Length of buffer

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_get\_u8(char \*pathstr, uint8\_t \*value)

Get resource (instance) value (u8)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[out]** u8 buffer to copy data into

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_get\_u16(char \*pathstr, uint16\_t \*value)

Get resource (instance) value (u16)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[out]** u16 buffer to copy data into

**Returns** 0 for success or negative in case of error.

int lwm2m\_engine\_get\_u32(char \*pathstr, uint32\_t \*value)

Get resource (instance) value (u32)

**Parameters**

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- value – **[out]** u32 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_u64(char *pathstr, uint64_t *value)`

Get resource (instance) value (u64)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** u64 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_s8(char *pathstr, int8_t *value)`

Get resource (instance) value (s8)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** s8 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_s16(char *pathstr, int16_t *value)`

Get resource (instance) value (s16)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** s16 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_s32(char *pathstr, int32_t *value)`

Get resource (instance) value (s32)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** s32 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_s64(char *pathstr, int64_t *value)`

Get resource (instance) value (s64)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** s64 buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_bool(char *pathstr, bool *value)`

Get resource (instance) value (bool)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- `value` – **[out]** bool buffer to copy data into

**Returns** 0 for success or negative in case of error.

`int lwm2m_engine_get_float32(char *pathstr, float32_value_t *buf)`

Get resource (instance) value (32-bit float structure)

**Parameters**

- `pathstr` – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”

- buf – [out] 32-bit float buffer to copy data into

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_get_objlnk(char *pathstr, struct lwm2m_objlnk *buf)
```

Get resource (instance) value (ObjLnk)

#### Parameters

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- buf – [out] [lwm2m\\_objlnk](#) buffer to copy data into

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_read_callback(char *pathstr, lwm2m_engine_get_data_cb_t cb)
```

Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads.

#### Parameters

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- cb – [in] Read resource callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_pre_write_callback(char *pathstr, lwm2m_engine_get_data_cb_t  
                                              cb)
```

Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

#### Parameters

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- cb – [in] Pre-write resource callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_validate_callback(char *pathstr, lwm2m_engine_set_data_cb_t  
                                              cb)
```

Set resource (instance) validation callback.

This callback is triggered before setting the value of a resource to the resource data buffer.

The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

---

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that `CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE` is large enough to store each of the validated resources (individually).

---

#### Parameters

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- cb – [in] Validate resource data callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_post_write_callback(char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.

This callback is triggered after setting the value of a resource to the resource data buffer.

It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- cb – **[in]** Post-write resource callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_exec_callback(char *pathstr, lwm2m_engine_execute_cb_t cb)
```

Set resource execute event callback.

This event is triggered when the execute method of a resource is enabled.

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res”
- cb – **[in]** Execute resource callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance create event callback.

This event is triggered when an object instance is created.

#### Parameters

- obj\_id – **[in]** LwM2M object id
- cb – **[in]** Create object instance callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance delete event callback.

This event is triggered when an object instance is deleted.

#### Parameters

- obj\_id – **[in]** LwM2M object id
- cb – **[in]** Delete object instance callback

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_set_res_data(char *pathstr, void *data_ptr, uint16_t data_len, uint8_t data_flags)
```

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- data\_ptr – **[in]** Data buffer pointer
- data\_len – **[in]** Length of buffer
- data\_flags – **[in]** Data buffer flags (such as read-only, etc)

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_get_res_data(char *pathstr, void **data_ptr, uint16_t *data_len, uint8_t *data_flags)
```

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res(/res-inst)”
- data\_ptr – **[out]** Data buffer pointer
- data\_len – **[out]** Length of buffer
- data\_flags – **[out]** Data buffer flags (such as read-only, etc)

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_create_res_inst(char *pathstr)
```

Create a resource instance.

LwM2M clients use this function to create multi-resource instances: Example to create 0 instance of device available power sources: `lwm2m_engine_create_res_inst("3/0/6/0");`

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res/res-inst”

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_delete_res_inst(char *pathstr)
```

Delete a resource instance.

Use this function to remove an existing resource instance

#### Parameters

- pathstr – **[in]** LwM2M path string “obj/obj-inst/res/res-inst”

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_update_service_period(k\_work\_handler\_t service, uint32_t period_ms)
```

Update the period of a given service.

Allow the period modification on an existing service created with `lwm2m_engine_add_service()`. Example to frequency at which a periodic\_service changes it's values : `lwm2m_engine_update_service(device_periodic_service, 5*MSEC_PER_SEC);`

#### Parameters

- service – **[in]** Handler of the periodic\_service
- period\_ms – **[in]** New period for the periodic\_service (in milliseconds)

**Returns** 0 for success or negative in case of error.

```
int lwm2m_engine_start(struct lwm2m\_ctx *client_ctx)
```

Start the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called by [lwm2m\\_rd\\_client\\_start\(\)](#). However, if the client does not use the RD client implementation, it will need to be called manually.

#### Parameters

- client\_ctx – **[in]** LwM2M context

**Returns** 0 for success or negative in case of error.

```
void lwm2m_acknowledge(struct lwm2m_ctx *client_ctx)
```

Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to send an empty ACK for a request earlier (from the application callback). The LwM2M engine will then send the actual response as a separate CON message after all callbacks are executed.

#### Parameters

- `client_ctx` – **[in]** LwM2M context

```
void lwm2m_rd_client_start(struct lwm2m_ctx *client_ctx, const char *ep_name, uint32_t flags,  
                          lwm2m_ctx_event_cb_t event_cb)
```

Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section 5.3 “Client Registration Interface” of the LwM2M Technical Specification.

NOTE: *lwm2m\_engine\_start()* is called automatically by this function.

#### Parameters

- `client_ctx` – **[in]** LwM2M context
- `ep_name` – **[in]** Registered endpoint name
- `flags` – **[in]** Flags used to configure current LwM2M session.
- `event_cb` – **[in]** Client event callback function

```
void lwm2m_rd_client_stop(struct lwm2m_ctx *client_ctx, lwm2m_ctx_event_cb_t event_cb)
```

Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section 5.3 “Client Registration Interface” of the LwM2M Technical Specification.

#### Parameters

- `client_ctx` – **[in]** LwM2M context
- `event_cb` – **[in]** Client event callback function

```
void lwm2m_rd_client_update(void)
```

Trigger a Registration Update of the LwM2M RD Client.

```
struct lwm2m_ctx
```

*#include <lwm2m.h>* LwM2M context structure to maintain information for a single LwM2M connection.

#### Public Members

```
struct sockaddr remote_addr
```

Destination address storage

```
struct coap_pending pendings[CONFIG_LWM2M_ENGINE_MAX_PENDING]
```

Private CoAP and networking structures

`void *processed_req`

A pointer to currently processed request, for internal LwM2M engine use. The underlying type is `struct lwm2m_message`, but since it's declared in a private header and not exposed to the application, it's stored as a void pointer.

`bool use_dtls`

Flag to indicate if context should use DTLS. Enabled via the use of `coaps://` protocol prefix in connection information. NOTE: requires `CONFIG_LWM2M_DTLS_SUPPORT=y`

`int sec_obj_inst`

Current index of Security Object used for server credentials

`int srv_obj_inst`

Current index of Server Object used in this context.

`bool bootstrap_mode`

Flag to enable BOOTSTRAP interface. See Section 5.2 “Bootstrap Interface” of LwM2M Technical Specification 1.0.2 for more information.

`int sock_fd`

Socket File Descriptor

[\*lwm2m\\_socket\\_fault\\_cb\\_t\*](#) `fault_cb`

Socket fault callback. LwM2M processing thread will call this callback in case of socket errors on receive.

[\*lwm2m\\_notify\\_timeout\\_cb\\_t\*](#) `notify_timeout_cb`

Notify Timeout Callback. LwM2M processing thread will call this callback in case of notify timeout.

`uint8_t validate_buf[CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE]`

Validation buffer. Used as a temporary buffer to decode the resource value before validation. On successful validation, its content is copied into the actual resource buffer.

`struct float32_value`

*#include <lwm2m.h>* 32-bit variant of the LwM2M float structure

`struct lwm2m_objlnk`

*#include <lwm2m.h>* LWM2M ObjLnk resource type structure.

## MQTT

- [Overview](#)
- [Sample usage](#)
- [Using MQTT with TLS](#)
- [API Reference](#)

**Overview** MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see <http://mqtt.org/>.

Zephyr provides an MQTT client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See [BSD Sockets](#) for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See <https://mosquitto.org/> for more information about the Eclipse Mosquitto project.

**Sample usage** To create an MQTT client, a client context structure and buffers need to be defined:

```
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT client context */
static struct mqtt_client client_ctx;
```

Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

```
/* MQTT Broker address information. */
static struct sockaddr_storage broker;
```

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

```
void mqtt_evt_handler(struct mqtt_client *client,
                     const struct mqtt_evt *evt)
{
    switch (evt->type) {
        /* Handle events here. */
    }
}
```

For a list of possible events, see [API Reference](#).

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

```
mqtt_client_init(&client_ctx);

/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;

/* MQTT buffers configuration */
```

(continues on next page)

(continued from previous page)

```
client_ctx.rx_buf = rx_buffer;
client_ctx.rx_buf_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buf_size = sizeof(tx_buffer);
```

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the `mqtt_connect` function, which will create the appropriate socket, establish a TCP/TLS connection, and send an MQTT CONNECT message. When notified, the application should call the `mqtt_input` function to process the response received. Note, that `mqtt_input` is a non-blocking function, therefore the application should use socket `poll` to wait for the response. If the connection was successful, `MQTT_EVT_CONNACK` will be notified to the application through the callback function.

```
rc = mqtt_connect(&client_ctx);
if (rc != 0) {
    return rc;
}

fds[0].fd = client_ctx.transport.tcp.sock;
fds[0].events = ZSOCK_POLLIN;
poll(fds, 1, K_MSEC(5000));

mqtt_input(&client_ctx);

if (!connected) {
    mqtt_abort(&client_ctx);
}
```

In the above code snippet, the MQTT callback function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See `mqtt-publisher-sample` for more information.

**Using MQTT with TLS** The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;

struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to [secure sockets documentation](#).

An example of how to use TLS with MQTT is also present in `mqtt-publisher-sample`.

## API Reference

group `mqtt_socket`

MQTT Client Implementation.

MQTT Client's Application interface is defined in this header.

---

**Note:** The implementation assumes TCP module is enabled.

---

---

**Note:** By default the implementation uses MQTT version 3.1.1.

---

## Defines

`MQTT_UTF8_LITERAL(literal)`

Initialize UTF-8 encoded string from C literal string.

Use it as follows:

```
struct mqtt_utf8 password = MQTT_UTF8_LITERAL("my_pass");
```

### Parameters

- `literal` – **[in]** Literal string from which to generate *mqtt\_utf8* object.

## Typedefs

```
typedef void (*mqtt_evt_cb_t)(struct mqtt_client *client, const struct mqtt_evt *evt)
```

Asynchronous event notification callback registered by the application.

**Param client** **[in]** Identifies the client for which the event is notified.

**Param evt** **[in]** Event description along with result and associated parameters (if any).

## Enums

```
enum mqtt_evt_type
```

MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.

Values:

enumerator `MQTT_EVT_CONNACK`

Acknowledgment of connection request. Event result accompanying the event indicates whether the connection failed or succeeded.

enumerator MQTT\_EVT\_DISCONNECT

Disconnection Event. MQTT Client Reference is no longer valid once this event is received for the client.

enumerator MQTT\_EVT\_PUBLISH

Publish event received when message is published on a topic client is subscribed to.

---

**Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with [mqtt\\_read\\_publish\\_payload](#) function.

---

enumerator MQTT\_EVT\_PUBACK

Acknowledgment for published message with QoS 1.

enumerator MQTT\_EVT\_PUBREC

Reception confirmation for published message with QoS 2.

enumerator MQTT\_EVT\_PUBREL

Release of published message with QoS 2.

enumerator MQTT\_EVT\_PUBCOMP

Confirmation to a publish release message with QoS 2.

enumerator MQTT\_EVT\_SUBACK

Acknowledgment to a subscribe request.

enumerator MQTT\_EVT\_UNSUBACK

Acknowledgment to a unsubscribe request.

enumerator MQTT\_EVT\_PINGRESP

Ping Response from server.

enum mqtt\_version

MQTT version protocol level.

*Values:*

enumerator MQTT\_VERSION\_3\_1\_0 = 3

Protocol level for 3.1.0.

enumerator MQTT\_VERSION\_3\_1\_1 = 4

Protocol level for 3.1.1.

enum mqtt\_qos

MQTT Quality of Service types.

*Values:*

enumerator MQTT\_QOS\_0\_AT\_MOST\_ONCE = 0x00

Lowest Quality of Service, no acknowledgment needed for published message.

enumerator MQTT\_QOS\_1\_AT\_LEAST\_ONCE = 0x01

Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

enumerator MQTT\_QOS\_2\_EXACTLY\_ONCE = 0x02

Highest Quality of Service, acknowledgment expected and message shall be published only once. Message not published to interested parties unless client issues a PUBREL.

enum mqtt\_conn\_return\_code

MQTT CONNACK return codes.

*Values:*

enumerator MQTT\_CONNECTION\_ACCEPTED = 0x00

Connection accepted.

enumerator MQTT\_UNACCEPTABLE\_PROTOCOL\_VERSION = 0x01

The Server does not support the level of the MQTT protocol requested by the Client.

enumerator MQTT\_IDENTIFIER\_REJECTED = 0x02

The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator MQTT\_SERVER\_UNAVAILABLE = 0x03

The Network Connection has been made but the MQTT service is unavailable.

enumerator MQTT\_BAD\_USER\_NAME\_OR\_PASSWORD = 0x04

The data in the user name or password is malformed.

enumerator MQTT\_NOT\_AUTHORIZED = 0x05

The Client is not authorized to connect.

enum mqtt\_suback\_return\_code

MQTT SUBACK return codes.

*Values:*

enumerator MQTT\_SUBACK\_SUCCESS\_QoS\_0 = 0x00

Subscription with QoS 0 succeeded.

enumerator MQTT\_SUBACK\_SUCCESS\_QoS\_1 = 0x01

Subscription with QoS 1 succeeded.

enumerator MQTT\_SUBACK\_SUCCESS\_QoS\_2 = 0x02

Subscription with QoS 2 succeeded.

enumerator MQTT\_SUBACK\_FAILURE = 0x80

Subscription for a topic failed.

enum mqtt\_transport\_type

MQTT transport type.

*Values:*

enumerator MQTT\_TRANSPORT\_NON\_SECURE

Use non secure TCP transport for MQTT connection.

enumerator MQTT\_TRANSPORT\_NUM

Shall not be used as a transport type. Indicator of maximum transport types possible.

## Functions

void mqtt\_client\_init(struct *mqtt\_client* \*client)

Initializes the client instance.

---

**Note:** Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

---

### Parameters

- *client* – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

int mqtt\_connect(struct *mqtt\_client* \*client)

API to request new MQTT client connection.

---

**Note:** This memory is assumed to be resident until mqtt\_disconnect is called.

---

---

**Note:** Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

---

---

**Note:** Default protocol revision used for connection request is 3.1.1. Please set *client.protocol\_version* = MQTT\_VERSION\_3\_1\_0 to use protocol 3.1.0.

---

---

**Note:** Please modify **:kconfig: `CONFIG\_MQTT\_KEEPALIVE`** time to override default of 1 minute.

---

### Parameters

- *client* – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

**Returns** 0 or a negative error code (errno.h) indicating reason of failure.

int mqtt\_publish(struct *mqtt\_client* \*client, const struct *mqtt\_publish\_param* \*param)

API to publish messages on topics.

### Parameters

- *client* – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Parameters to be used for the publish message. Shall not be NULL.

**Returns** 0 or a negative error code (errno.h) indicating reason of failure.

```
int mqtt_publish_qos1_ack(struct mqtt_client *client, const struct mqtt_puback_param *param)
```

API used by client to send acknowledgment on receiving QoS1 publish message. Should be called on reception of *MQTT\_EVT\_PUBLISH* with QoS level *MQTT\_QOS\_1\_AT\_LEAST\_ONCE*.

#### Parameters

- *client* – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Identifies message being acknowledged.

**Returns** 0 or a negative error code (*errno.h*) indicating reason of failure.

```
int mqtt_publish_qos2_receive(struct mqtt_client *client, const struct mqtt_pubrec_param *param)
```

API used by client to send acknowledgment on receiving QoS2 publish message. Should be called on reception of *MQTT\_EVT\_PUBLISH* with QoS level *MQTT\_QOS\_2\_EXACTLY\_ONCE*.

#### Parameters

- *client* – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Identifies message being acknowledged.

**Returns** 0 or a negative error code (*errno.h*) indicating reason of failure.

```
int mqtt_publish_qos2_release(struct mqtt_client *client, const struct mqtt_pubrel_param *param)
```

API used by client to request release of QoS2 publish message. Should be called on reception of *MQTT\_EVT\_PUBREC*.

#### Parameters

- *client* – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Identifies message being released.

**Returns** 0 or a negative error code (*errno.h*) indicating reason of failure.

```
int mqtt_publish_qos2_complete(struct mqtt_client *client, const struct mqtt_pubcomp_param *param)
```

API used by client to send acknowledgment on receiving QoS2 publish release message. Should be called on reception of *MQTT\_EVT\_PUBREL*.

#### Parameters

- *client* – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Identifies message being completed.

**Returns** 0 or a negative error code (*errno.h*) indicating reason of failure.

```
int mqtt_subscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)
```

API to request subscription of one or more topics on the connection.

#### Parameters

- *client* – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- *param* – **[in]** Subscription parameters. Shall not be NULL.

**Returns** 0 or a negative error code (*errno.h*) indicating reason of failure.

int mqtt\_unsubscribe(struct [mqtt\\_client](#) \*client, const struct [mqtt\\_subscription\\_list](#) \*param)

API to request unsubscription of one or more topics on the connection.

---

**Note:** QoS included in topic description is unused in this API.

---

#### Parameters

- `client` – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – **[in]** Parameters describing topics being unsubscribed from. Shall not be NULL.

**Returns** 0 or a negative error code (`errno.h`) indicating reason of failure.

int mqtt\_ping(struct [mqtt\\_client](#) \*client)

API to send MQTT ping. The use of this API is optional, as the library handles the connection keep-alive on it's own, see [mqtt\\_live](#).

#### Parameters

- `client` – **[in]** Identifies client instance for which procedure is requested.

**Returns** 0 or a negative error code (`errno.h`) indicating reason of failure.

int mqtt\_disconnect(struct [mqtt\\_client](#) \*client)

API to disconnect MQTT connection.

#### Parameters

- `client` – **[in]** Identifies client instance for which procedure is requested.

**Returns** 0 or a negative error code (`errno.h`) indicating reason of failure.

int mqtt\_abort(struct [mqtt\\_client](#) \*client)

API to abort MQTT connection. This will close the corresponding transport without closing the connection gracefully at the MQTT level (with disconnect message).

#### Parameters

- `client` – **[in]** Identifies client instance for which procedure is requested.

**Returns** 0 or a negative error code (`errno.h`) indicating reason of failure.

int mqtt\_live(struct [mqtt\\_client](#) \*client)

This API should be called periodically for the client to be able to keep the connection alive by sending Ping Requests if need be.

---

**Note:** Application shall ensure that the periodicity of calling this function makes it possible to respect the Keep Alive time agreed with the broker on connection. [mqtt\\_connect](#) for details on Keep Alive time.

---

#### Parameters

- `client` – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

**Returns** 0 or a negative error code (`errno.h`) indicating reason of failure.

int mqtt\_keepalive\_time\_left(const struct [mqtt\\_client](#) \*client)

Helper function to determine when next keep alive message should be sent. Can be used for instance as a source for poll timeout.

**Parameters**

- `client` – **[in]** Client instance for which the procedure is requested.

**Returns** Time in milliseconds until next keep alive message is expected to be sent.

Function will return -1 if keep alive messages are not enabled.

int mqtt\_input(struct [mqtt\\_client](#) \*client)

Receive an incoming MQTT packet. The registered callback will be called with the packet content.

---

**Note:** In case of PUBLISH message, the payload has to be read separately with [mqtt\\_read\\_publish\\_payload](#) function. The size of the payload to read is provided in the publish event structure.

---

---

**Note:** This is a non-blocking call.

---

**Parameters**
